

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. MUSCLE SHOALS.

THURSDAY, FEBRUARY 16, 1922.

UNITED STATES SENATE.
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to call, at 10.30 o'clock a. m. in room 224, Senate Office Building, Senator George W. Norris presiding

Present: Senators Norris (chairman), Page, McNary, Capper, Keyes, Harrell, Ladd, Smith, Ransdell, Kendrick, Harrison, and Heflin.

The CHAIRMAN. The committee is in session this morning for the purpose of hearing Governor Taylor, of Tennessee, and his associates on the Muscle Shoals proposition.

I will ask the reporter to copy the bill that we are considering into the record at this point.

(The bill referred to is here printed in full, as follows:)

[S. 3420, Sixty-seventh Congress, second session.]

A BILL To provide for the manufacture of explosives for the use of the Army and Navy, to provide for the manufacture of fertilizer for agricultural purposes, to incorporate the Federal Chemical Corporation, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of War is hereby authorized and directed to complete the construction of Dams Numbered Two and Three in the Tennessee River, at Muscle Shoals, Alabama, in accordance with the terms of such project as adopted by the letter of the President dated February 23, 1918, under authority of section 124 of an act entitled "An act for making further and more effectual provisions for the national defense, and for other purposes," approved June 3, 1916; and in order to provide for a larger amount of primary power to be developed at said dams, the Secretary of War is authorized and directed to cause surveys to be made above said dams on the Tennessee River and its tributaries for the purpose of locating storage reservoirs, and if a suitable site or sites can be found upon such investigation, where practical storage reservoirs can be obtained at reasonable cost, the Secretary is directed to take the necessary steps to secure such sites and to build the necessary dams for the impounding of water therein. If the Secretary of War, under authority of this act, constructs one or more dams for the purpose of impounding the waters of said river he shall give due consideration in the construction of such dams to the possibilities of the development of hydro-electric power and to the necessities of navigation.

SEC. 2. That in the construction of said Dam Numbered Three, or in the construction of other dams or other works provided for in this act, the Secretary of War is hereby authorized to use and to remove any of the temporary buildings now owned by the Government of the United States and erected anywhere in the vicinity of Muscle Shoals or nitrate plants numbered one or two, providing the removal of such buildings will not interfere with the operations of the Federal Chemical Corporation as hereinafter set forth.

SEC. 3. That if the Secretary of War should find it advisable and practical to construct storage reservoirs on the Tennessee River or any of its tributaries as hereinbefore provided, and that by virtue thereof the flow of the Tennessee River is equalized and a larger amount of primary power thereby developed, he shall require of any private person, partnership, or corporation maintaining a dam on said river for the development of power, to contribute his or its proportionate share for the construction of said reservoirs, and he is hereby authorized to take the necessary action or actions in court for the purpose of

compelling contribution to such development by any person, partnership, or corporation receiving the benefits therefrom; and if the right to dam said river for the purpose of developing hydroelectric power is hereafter given by virtue of any law of the United States, to any person, partnership, or corporation, one of the requirements of said grant shall be that the person, partnership, or corporation given the privilege to build any such dam, shall pay his or its proportionate share of the expenses of the construction of any such reservoir or reservoirs, either then constructed or thereafter constructed by virtue of this act.

SEC. 4. That there is hereby incorporated and created a corporation by the name, style, and title of "The Federal Chemical Corporation" (hereafter referred to as the corporation). Said corporation shall have perpetual succession and shall have power—

(1) To adopt, use, and alter a corporate seal;

(2) To sue and be sued and to complain and to defend in any court of law and equity within the United States;

(3) To make and enforce such contracts as may be necessary to carry out the provisions of this act;

(4) To appoint and fix the compensation of such employees, attorneys, and agents as are necessary for the transaction of the business of the corporation, to define their duties, require bonds of them, and fix the penalties thereof; but in no case shall any such employee receive a salary in excess of \$12,000 per annum;

(5) To prescribe, amend, and repeal by-laws not inconsistent with this act for the conduct of its business; and

(6) To exercise all the rights, powers, and privileges conferred upon it by this act and such additional powers as may be necessary to carry out the provisions of this act.

SEC. 5. That the business of said corporation shall be transacted by a board of directors (hereinafter called the board), consisting of three persons, to be appointed by the President of the United States, and by and with the advice and consent of the Senate. Members of said board shall hold their offices during good behavior and shall receive a salary of \$7,500 per year, payable monthly: *Provided*, That any member of said board may be removed from office at any time by a concurrent resolution of the House of Representatives and the Senate. No member of said board shall during his continuance in office be engaged in any other business, but shall give his entire time to the business of said corporation. Said board shall select one of its members as president. It shall select a treasurer and as many assistant treasurers as it deems proper, and such treasurer and assistant treasurers may be corporations or banking institutions and shall give such security for the safe-keeping of the moneys of said corporation as the board may require. In the appointment of officials and the selection of employees for said corporation and in the promotion of any such employees or officials no political test or qualifications shall be permitted or given consideration, but all such appointments and promotions shall be given and made on the basis of merit and efficiency. The board shall give publicity to any request, coming from any source, asking for any favor in behalf of any person or the promotion of any employee. Any member of said board who permits the use of political or partisan influence in the selection of any employee, or in the promotion of any such employee of said corporation, or who gives any consideration to political considerations in the official action of said board, or who, knowing that such political influence has been or is attempted, does not give publicity to the same, shall be deemed guilty of a misdemeanor and upon conviction thereof shall be fined in a sum not exceeding \$1,000 or be imprisoned not to exceed six months, or both such fine and imprisonment, and the conviction of any member of said board of the offense herein defined shall have the effect of removing such member from office.

SEC. 6. That upon the completion of the organization of said corporation, the President and the Secretary of War shall turn over to said corporation United States nitrate plants numbered one and two, erected at Muscle Shoals, Alabama, together with all real estate used in connection therewith; all machinery, tools, equipment, accessories, and materials thereunto belonging; all laboratories and plants used as auxiliaries thereto, including the Fixed Nitrogen Research Laboratory at Washington, the Waco Quarry in Franklin County, Alabama, the Warrior steam plant at Gorgas, Alabama, together with

the transmission line from Gorgas to Muscle Shoals; the railroad, together with the engines, cars, tools, materials, machine shops, and all accessories used in the operation of said railroad at or near Muscle Shoals, Alabama; and all other power units and transmission lines of the United States used as auxiliaries of the United States nitrate plants numbered one and two: *Provided, however*, That the transfer of any of the property above described to said corporation shall be subject to such use of said property by the Secretary of War as he may elect, in the construction and development of the dams hereinbefore provided for.

As soon as any of the dams herein provided to be constructed by the Secretary of War have been completed the President and the Secretary of War shall turn the same over to said corporation, and thereafter said property shall be in the control and under the management of said corporation. Said corporation shall also have the power and authority to acquire, establish, maintain, and operate such other laboratories and experimental plants as may be deemed necessary or advisable by said corporation to carry out the provisions of this act. It shall have power to establish agencies anywhere in the United States for the sale of its products, and in order to prevent a monopoly of the fertilizer business or the undue and unreasonable advance in the price of fertilizer, it shall have power to manufacture a completed fertilizer ready for use, and if necessary, to sell the same direct to farmers or to organizations of farmers; and in the sale of chemical parts of fertilizer to manufacturers thereof, it shall have power to prescribe the price at which such manufacturer so purchasing any of the corporation's products shall sell the fertilizer to the farmer. It is hereby declared that one of the objects of this act is to regulate the sale of fertilizer to persons engaged in agriculture with a view to preventing the control of the price of such fertilizer by a monopoly or the sale thereof at unreasonable prices.

Said corporation is authorized to negotiate with the Alabama Power Company for the purpose of settling the difficulties existing between the Government of the United States and the said power company by virtue of the joint ownership of the power plant at Gorgas, Alabama; and it is authorized to sell the interest of the Government of the United States in said plant to the said Alabama Power Company, and to use the money received therefor in the operation of its business as hereinbefore described: *Provided, however*, That no such sale and no such agreement shall be valid or binding until approved by the President of the United States.

SEC. 7. That said corporation shall proceed to remodel nitrate plant Numbered One, at Muscle Shoals, Alabama, so that the same may be used for the manufacture of explosives and for the manufacture of fertilizer; and proceed to erect the necessary buildings and install the necessary machinery so that nitrate plant Numbered Two may be used for the manufacture of fertilizer. It shall be the duty of said board, through the operation of its laboratories and experimental plants, to devise and install improvements in nitrate plants Numbered One and Two as such experiments and developments may, in the judgment of the said board, be deemed advisable.

SEC. 8. That in case all of the power developed at Dams Numbered Two and Three, and at any other dam or dams constructed by the Secretary of War under the provisions of this act and turned over to the corporation, can not be used to practical advantage and is not necessary for the manufacture of fertilizer or for explosives, as herein provided, the board may in its discretion sell any such surplus power so developed to any State, municipality, district, corporation, partnership, or person upon such terms and under such conditions as the board may deem just; and if there is a demand for the purchase of such surplus power from both private and public interests, the board shall give precedence in the sale thereof to States, counties, and municipalities, and if the sale of any such surplus power is made to private individuals, partnerships, or corporations the board may as one of the conditions of such sale provide in the contract of such sale for the regulation of the price at which any such individual, partnership, or corporation shall charge the consumer in a resale of such power.

SEC. 9. That from time to time the Secretary of War shall notify said board of the approximate amount of explosives that in his judgment will be needed by the Army and Navy, and it shall be the duty of the board to supply the Army and Navy with the amount of explosives so required; and in time of war, or at any other time when in the opinion of the President of the United States, war is imminent, the President may take full possession of all of the property herein described and use the same for the manufacture of explosives to be used by the Army and Navy; or, in such case, the President may, if he

so elects, direct the board to cease, either in part or wholly, the manufacture of fertilizer and to utilize said property to such extent as he may direct, in the operation of explosives. Until such was ended, or in the opinion of the President the danger thereof has passed, the said board shall operate said property in accordance with the direction and under the instruction of the President of the United States.

SEC. 10. That the board shall make a full, complete, and detailed report of its operation as soon after the close of each calendar year as possible to the Congress of the United States. In addition to the report so made the Secretary of War shall, at least once each year, make a complete audit of all the accounts and all the financial operations of said corporation, and shall include in his annual report to Congress a detailed statement thereof.

The principal place of business of said corporation shall be established by the board at or near Muscle Shoals, Alabama.

STATEMENT OF HON. ALF A. TAYLOR, GOVERNOR OF THE STATE OF TENNESSEE.

Governor TAYLOR. Mr. Chairman and gentlemen of the committee, I promise you in advance that I shall be very brief in what I may have to say. We are very much interested in the Henry Ford proposal. We believe that his proposition is a very good one. We believe that he is the best proposer. We think that he is an honest man. My contact with him has led me to believe that he is an honest, clean man. If I needed an indorsement to increase my confidence, the indorsement of one man I know of would be sufficient for me, and that man is Thomas A. Edison, whom I have the honor of knowing. He said in my presence that it was impossible to conceive the immensity of the power that could be produced by that plant when completed, and that the benefits to be derived to the country at large were also inconceivable, and that Henry Ford was the man to take hold and operate it when it was completed, because he was an honest man, and a man of splendid judgment, and a man who had succeeded, and a man who had the money.

Of course, the project was commenced as, perhaps, a war measure, looking to the manufacture of munitions of war, but it can be easily converted into the products of power to manufacture the implements of peace.

Now, it is an obstruction to navigation as it is. People used to use the Tennessee River to carry their grain and their iron and things that they had to sell down the river to Paducah at least eight months in the year. There was a packet company at Chattanooga that used it for eight months in the year. I remember 60 years ago that my father used to take his boats down the river, even out of the Watauga.

The CHAIRMAN. The reason that they did not use it for 12 months was on account of the low water?

Governor TAYLOR. Yes, sir.

The CHAIRMAN. There is no ice to interfere with commerce on that river?

Governor TAYLOR. No, sir.

It is an obstruction to navigation. If it is completed, it makes the river navigable the year around, because that is provided for; and then, look what it means in the way of cheap power. It is in the heart of a great agricultural region, and a great mineral region, and also a great timber region. About the only virgin forest left of hardwood timber is in that region, and we have iron, coal, copper, zinc, lead, manganese—most every mineral we possess—and it has not been developed so far simply because of the lack of machinery and cheap power to operate it. If the project is completed and the power developed, it means new enterprises, it means a new field for the employment of labor, and will do more to solve the unemployment condition in this country than anything that could be done by Congress. It means new wealth, the creation of new wealth, the enlargement of the bases of taxation—national, State, and county.

It means new life, gentlemen, new hope, and it is needed at this time. There is a dearth in business. There is depression among the people, and they are longing for something to be starting.

The completion of this project will give life and give hope, will act as an impetus to every class of business in every line.

Now, I heard a gentleman say, "We do not live in that region; it is in the South." Now, of course, no argument is needed in this committee of Senators to attempt to show them that sectional prejudice ought not to cut any figure in this matter. We did not offer any objection when the Government was ex-

pending \$116,000 to develop the great West. We did not offer any objection when they were spending all this money in those irrigation projects of the West, the building of the Roosevelt Dam in Arizona, and all those projects looking to the development of the western sections of our country. We rejoiced. We did not offer any argument against the donation by the Government of the United States of about 117,000,000 acres of the public domain, in which we were interested equally with all the rest of the United States, in encouraging the construction of railroads, to solve the question of transportation in the interest of the development of the great West. We rejoiced. We said "Amen. What is good for the West is good for the South." What is good for one section of this Union is good for every section of this Union.

There is very little prejudice left. We have been together and have shown what we could do when we all get together. We were divided once. I remember it. I lived through it, a mere boy, but I remember it as if it were yesterday, when we were divided and hostile. But there have been two occasions when we got together in this country since that division. We were united in the Spanish-American War, when the first blood spilled in that war was the blood of a son of the South. We were a unit in the World War, when the boys were called upon from every section to rally to the flag, and they rallied and constituted an army that turned the tide of battle in the World War, and I do not make the statement in disparagement of any other military organization in that great army, but it so happened on account of location; it so happened that the division, the immortal Thirtieth Division, composed of South Carolinians, Georgians, Tennesseans, and Alabamians, were the first to break the Hindenberg line.

Now, gentlemen, pass this measure, and every vestige of any sectional prejudice that may linger will be wiped away forever.

It is a great proposition and, as I said before, Henry Ford is the man to operate it when it is finished. He is an honest man, as I said before, and he does not wish to take hold of it with the view of making money. He said so. I heard him say so time and time again, and I believe him. He wants to do something for his country. He wants to increase production of the farms throughout the United States. It is natural that he, like other great financiers, when they get to be of his age, want to build himself a monument. He is following in the footsteps of other great American financiers, and it is highly commendable for men to use their great wealth for the upbuilding of their country, for the uplift of mankind.

He said he had all the money he wanted. He told me he had all the money he wanted, and that his family had all the money they wanted. If they lived to be as old as Methuselah, they could not spend it. He wanted to make cheap fertilizers for the country and use that vast power there for the upbuilding of the country and the upbuilding of humanity.

I express the sentiments of every man and woman in Tennessee, without any exception, without regard to political affiliations, without regard to anything; I express the sentiment of every human being in my State, when I say that they are looking and longing for Congress to pass this great measure.

I thank you, gentlemen, for your very kind and courteous hearing.

The CHAIRMAN. We are very much obliged to you, Governor.

Who is your next witness?

Governor TAYLOR. As to its effect on agriculture, gentlemen, if you so desire, I have brought with me the commissioner of agriculture of Tennessee, and I would like for you to see what kind of looking men our farmers in Tennessee are now.

The CHAIRMAN. Is your commissioner a farmer?

Governor TAYLOR. My commissioner is a farmer, and a No. 1 farmer, and he fought as a captain during the Spanish American War and made an enviable record.

Capt. Thomas F. Peck.

The CHAIRMAN. Captain Peck, we will be very glad to hear you.

STATEMENT OF MR. THOMAS F. PECK, COMMISSIONER OF AGRICULTURE OF THE STATE OF TENNESSEE.

Mr. PECK. Mr. Chairman, I will just make a short statement of my reasons for believing that the Government should accept the offer made by Henry Ford for Muscle Shoals.

The production of crops depletes the soil, no matter where located or how fertile. If the plant food taken from the soil by each crop each year is not re-

placed in some form, decreased production will follow. Nitrogen, the most important element of plant food, is the easiest exhausted, and has been found the most difficult and expensive to replace. Maintaining the fertility of the soil is of vital importance to every agricultural section of the United States, and every means of doing this and every movement in that direction that is feasible should be encouraged. Different sections of our country produce different products, required by all the people for food and for clothing. All sections of the country are dependent on each particular section for the product it supplies. This is particularly true of the section in which Muscle Shoals is located, for it is in the heart of the greatest cotton producing section of the world—the South—which supplies the mills of New England and Old England, of France, Belgium, Italy, and mills in all sections of the world. Any project which will make it possible for the farmer of the South to obtain cheaper fertilizer, so necessary in the production of his crop, will enable him to raise more cotton to the acre, and will result in good to the whole country—not alone to the South. The benefits of increased production of crops are not confined to the producing farmer, but are also reaped by the consumer, and any movement that will result in increased production should be encouraged. I believe that the acceptance of the offer of Mr. Ford will result in greatly increased crop production in the South, and will be of great benefit to the whole country.

Developing the water power possibilities of Muscle Shoals, as begun by the Government, and which is proposed to be completed by Mr. Ford, will make available an immense amount of cheap power which can be utilized in the manufacture of the raw material found in that section in such great variety and quantity. The argument has been advanced that this would be a sectional benefit. On the contrary, experience has shown that the citizenship of sections where such resources have been developed have received a mess of pottage for their birthright in the pittance paid such local labor as was employed. In most instances the profits have been enjoyed by the shrewd investors of other sections of the country, who could combine their capital and provide the technically trained experts to direct the labor for development and manufacture. The utilization of the water power at Muscle Shoals in developing the mining and manufacture of raw materials will make available to the manufacturing centers of the country cheaper raw materials and increased advantages for the successful production of what they are manufacturing. With the Government's expenditure at Muscle Shoals, which would be a loss if not completed, and with an offer from a man who has proven his capacity and has ample funds to carry out his plans, and where the completion of the project would result beneficially to the entire country, I can see no reason for not accepting Mr. Ford's offer.

There is an immense army of unemployed in the country. Men who were profitably employed before the United States became involved in the World War, and were drafted into the service of the country, are now in great numbers out of employment. They were discharged at the close of the war, without provision for their employment. Many of them gave up good positions to enter the Army or to go into some one of the war industries so necessary in the successful conduct of the war. They are now scattered in all sections of the country without work. Such an army of unemployed is a menace to the entire country, and any project the development of which promises to relieve this condition should, by all means, have the encouragement of the Federal Government. There is no doubt that the completion of Muscle Shoals and its operation as planned by Mr. Ford would be a great step in relieving this condition of unemployment, in that it would give employment direct to a large number and would be the means of stimulating industry in the entire country to the point where all the unemployed could be utilized, and a menacing condition done away with. It would be a distinct service to the unemployed in their extremity. I know that the completion of the Muscle Shoals project, with the revival in industry which would result in the South, and would spread to the whole country, would have the hearty and unreserved approval of the people.

Further, you are all familiar with the fact that it was just a few decades ago that 85 per cent of our population was agricultural. Now, it has reversed itself, and almost 85 per cent of them have left the farm.

We have all got to be fed. Anything that will make conditions better for the agricultural classes, for maintaining production by a smaller force, should have our very careful and considerate attention.

I thank you.

The CHAIRMAN. How many men would be employed—can you tell us?

Mr. PECK. Only in a general way. I would not be in a position to go into detail, but a project of that magnitude, and the industries that will naturally result, would relieve the situation very materially.

I thank you.

The CHAIRMAN. I am much obliged to you, Captain.

Governor, who is the next witness that you desire to call?

Governor TAYLOR. I believe we are through, Mr. Chairman.

The CHAIRMAN. Is there anyone else who wants to be heard?

Governor TAYLOR. We have a manufacturer, a distinguished gentleman who resides in Chattanooga, Mr. Kreusi, who I would like for the committee to hear for a few minutes.

The CHAIRMAN. All right, Mr. Kreusi, we will be very glad to hear you.

STATEMENT OF MR. PAUL KREUSI, CHATTANOOGA, TENN.

Mr. KREUSI. This is quite unexpected, I assure you, as I did not expect to speak before your committee.

I am a manufacturer of electric furnace products at Chattanooga.

The thought I want to impress upon you is this, you do not need any reminder, the Committee on Agriculture does not—I do not believe this committee should give serious consideration in connection with any project in reference to Muscle Shoals that is not primarily connected with the needs of agriculture, and, as I understand it, the only proposition yet before either branch of Congress, that has thought of the need of agriculture, is the project of Henry Ford.

Other people and other interests talk about developing the power and using the power for their purposes, but Ford is the one man that comes and makes the statement that he will use as much power as that plant, built by the Government at an expenditure of \$105,000,000, as much as that will consume, and that certainly will benefit the agriculture of the United States. That is the only proposition before you, and the only one that will come before you. The only proposition is the Ford proposition to operate the nitrate plant, and produce fertilizers of the present type, and also new ones. It is the only proposition that insures some relief to the farmers, and it will therefore reduce the cost of living for all the people of the United States.

The CHAIRMAN. It is true that there is no proposition officially before us, but I notice in the newspapers that the Alabama Power Co., a corporation of Alabama, has made a proposition.

Mr. KREUSI. It is a New York corporation.

The CHAIRMAN. Do you know anything about their offer?

Mr. KREUSI. I have no hostility or interest in that corporation, and what I say is unprejudiced. I have read the digest of their offer in the New York Times, and I can not see anything in it that could interest this Senate Committee on Agriculture. They offer in brief to take over these power plants for their own commercial purposes, to sell and control the power in the South, but they do not undertake to operate the nitrate plant.

They say they will turn back to the Government such power as the Government might need, secondary power, that they will turn back to you such an amount as you may need, if you want to operate the nitrate plant, but they do not say that they will operate the nitrate plant and produce cheaper fertilizer for the farmers and consumers in the United States.

The CHAIRMAN. In the newspapers I have noticed that there was a claim, I think conceded by some of the representatives of the Government, at least so the paper indicated that I read, of the Alabama Power Co. as to the title to one of these projects, or part at least, some portion of the Muscle Shoals project, that the Government was improving. Do you know anything about that?

Mr. PECK. Only what I read in the newspapers. It is a legal question which I think this committee, in fact the committees of both Houses of Congress, would be safe in leaving to the legal department of the Government. A layman like myself could not pass an opinion, an intelligent opinion that you gentlemen should listen to as to the merit of that controversy. If there is any legal question involved, I would do as we do as individuals, if we want the opinion of a doctor we call an expert physician, and if we want the opinion of a lawyer we go to a lawyer, and as I understand it the War Department was advised as to what its rights are by the Attorney General, and I would prefer not to discuss it.

Senator RANDELL. Are you familiar with nitrate plants in the world which are making nitrogen to use as fertilizers in agriculture?

Mr. KREUSI. Not personally. We know, in round numbers, that 1,000,000 horsepower are employed in Norway and France, and also in Japan in the manufacture of such fertilizers. Germany also uses hydroelectric power very extensively.

Senator RANDELL. And it has been successfully carried on?

Mr. KREUSI. Yes, sir; it is an old story.

Senator RANDELL. It is not new or anything visionary?

Mr. KREUSI. Not visionary at all; not at all.

Senator RANDELL. It has been demonstrated time and time again?

Mr. KREUSI. Absolutely. It is done right here on the imaginary line that divides Canada and the United States.

Senator RANDELL. Have not the Canadians done it successfully?

Mr. KREUSI. Yes, sir; for years.

Senator RANDELL. Have you any idea of the cost of nitrogen as compared with Chilean nitrates?

Mr. KREUSI. No, sir; I would not undertake to discuss that, but it is evidently possible; practical and possible to compete with Chilean nitrate, I submit, or the Canadian companies would not be in business.

Senator SMITH. It might be well in that connection to state that the Niagara company ship their products to the Atlantic Seaboard in competition with the Chilean nitrate, and it has been used in large quantities in compound and commercial fertilizer.

Mr. KREUSI. That is well known to be true.

The chairman made a very interesting point a minute ago. I pricked up my ears. He asked if this was not an iceless region. That is a point for your consideration. It is a fortunate accident, of course, of nature, this great plant, with the largest potential hydroelectric development in the United States east of the Mississippi River. This plant is located so that it is not affected by climate, so that there is no interruption by ice, as there is in many northern operations. It is never closed by ice. You can rely on it to produce the power year in and year out.

In another committee yesterday—the committee of the House—the question was asked of Governor Taylor as to the navigation of the Tennessee River, as to whether there was any obstruction to navigation before this dam was partially completed. The governor, perhaps, did not emphasize as much as he might have that we did have navigation on this river of a sort until the Government obstructed the river by the building of this dam.

You gentlemen understand that there is a stretch completely across that river now, a dam, the concrete portion of which comes up to the general level of the river, so that we can not get up or down. We can not transport our products any more. I used to be able to ship my products to Chicago, etc., and we would save our shippers \$1 a ton and still make money. We had two packet lines operating to Chattanooga, connecting up with the Mississippi River and the great territory that the Mississippi River serves, and we saved the shippers \$1.50 a ton on pig iron alone, and we could make money in doing so, as compared with the all-rail rates.

What is the position the Government occupies to-day? You have obstructed the sixth largest river on the continent.

We had 652 miles of partial navigation on that river until you put the dam there and stopped us. The only interruption to navigation was that we would occasionally have the water so low that we could not get by there at Muscle Shoals, but we could figure on eight and a half months of navigation.

Senator HEFLIN. There never was any doubt about the sufficiency of the water in the river, but it was spread out, and this dam, when completed, would make the river navigable for 17 miles.

Mr. KREUSI. Yes, sir; and remove the only serious present obstacle to navigation.

The CHAIRMAN. I am interested in that point. I think it is important from a governmental standpoint. I would like to get a little fuller information as to how much traffic this dam, partially constructed by the Government, has cut out.

Mr. KREUSI. I would like you to permit me to file a little statement with you in written form. I can get within a few hours or a few days' time from the chief engineer's office, or the Department of Commerce complete and reliable information as to that. I have had it heretofore.

The CHAIRMAN. I would be very glad for you to do that. If the Government, by means of this partially constructed dam has interfered with your navigation—

Mr. KREUSI (interrupting). You have reason to?

The CHAIRMAN (continuing). It is morally obliged to complete it or tear out what it put in.

Mr. KREUSI. I am glad you recognize that moral obligation. I would like to emphasize that a little bit.

Some years ago the Senate and House passed a bill permitting the Chattanooga citizens to dam the same stream 33 miles by river and 19 miles by air line from Chattanooga to Hales Bar. That dam was constructed by a special act of Congress, which cost \$58,000,000, and it backed up that water, and made a great lake, giving us magnificent navigation through the second worst portion of the river.

In the days when General Grant blockaded, or laid siege to Chattanooga, and when it was necessary for him to come up with food, he had to wind a cable around a tree and pull a boat up a certain distance, and then unwind the cable and take it to a tree farther up and keep on pulling the boat up in that manner, pulling the boat through the rapids. Now, those rapids are gone.

The point I want to make is this:

When the proponents of that measure appeared before the committees of the House and Senate, and offered to remove this obstruction at Hales Bar, which was the second worst obstruction that there was to navigation, this obstruction has been removed successfully.

I use 6,000 horsepower ordinarily in my electric furnace operations at Chattanooga. When they offered to do these things Mr. Burton, and other members of the Rivers and Harbors Committee created a moral obligation that you, gentlemen, ought to carry out. They made the statement that if we would finish the project at Hales Bar, they would do the same thing at Muscle Shoals.

The CHAIRMAN. Is Muscle Shoals above Hales Bar?

Mr. KREUSI. No. It is about 100 miles from there.

The CHAIRMAN. Hales Bar is between Muscle Shoals and Chattanooga?

Mr. KREUSI. Yes, sir; and the head of navigation. Hales Bar has been in successful operation since 1913 or 1914.

The CHAIRMAN. Let me get the understanding right, and I am afraid I might disclose my ignorance of geography when I do it. Does this obstruction at Muscle Shoals prohibit the use of the river at Hales Bar?

Mr. KREUSI. The dam stretches from shore to shore. We have a stream like the Hudson River from Muscle Shoals to the Ohio.

The CHAIRMAN. How far is that?

Mr. KREUSI. Five hundred miles.

The CHAIRMAN. Hales Bar is on the upper side?

Mr. KREUSI. Hales Bar is on the upper side; yes, sir. From Hales Bar down we have something now for which we will not have to come to you any more and ask for money. The Tennessee River is the sixth largest stream in the United States.

The CHAIRMAN. How far above Muscle Shoals is Hales Bar?

Mr. KREUSI. I should say 100 miles above Muscle Shoals is Hales Bar.

This will give you a better idea: By a freak of nature, Birmingham, Memphis, Nashville, and Chattanooga are about equidistant from Muscle Shoals. It is approximately 130 miles by transmission line—what would be 130 miles by transmission line—from Muscle Shoals to Chattanooga, an easy transmission distance for electrical power for all the great cities.

Now, Mr. Burton and his associates on the committee said that if we were to complete our part of the project, they would do the rest; and instead of doing that, they have thrown a dam across the river from here to here [indicating], not finished so that we can get any power; and the way they have managed it is absolutely putting a cork in the neck of the bottle, and we can't get up or down stream; and we can never resume our river navigation—we can not resume until they blow up that dam across the river or finish it.

Senator RANSDELL. That dam was put in by the Government as a war proposition, was it not?

Mr. KREUSI. Yes, sir.

Senator RANSDELL. There were several locks and dams there which gave a canalized navigation over that river.

Mr. KREUSI. Yes, sir.

Senator RANSDELL. Built by the Government?

Mr. KREUSI. Taken over by the Government.

Senator RANDELL. Taken over by the Government and built by private people. You are right about what you said about Mr. Burton. We did create that moral obligation, because there was considerable navigation up this river prior to the building of this great lock and dam, which is now incomplete.

Mr. KREUSI. Yes.

Senator RANDELL. And when this present project is completed, it will drown out all of the works which we have been using.

Mr. KREUSI. Which are obsolete.

Senator RANDELL. And give you a modern, up to date navigation, as compared with the inferior navigation heretofore. You did use it and carried freight on it, did you not?

Mr. KREUSI. A very tremendous tonnage.

Senator RANDELL. But you will have a very much better river when this is completed?

Mr. KREUSI. For the first time we will have a river that I would say, under the modern conditions of to-day that it is practical to operate. We will have a fine navigable river, and can use steel barges on it as the Government does on the Mississippi River, and can navigate over that region from Chattanooga to Paducah, and enter into the Ohio and Mississippi.

Senator RANDELL. You can do this for 12 months in the year, too, can you not?

Mr. KREUSI. Every single day of the year.

Senator RANDELL. Is there not a great deal of potential commerce adjacent to that river?

Mr. KREUSI. Yes, sir.

Senator RANDELL. Of the heaviest kind of freight?

Mr. KREUSI. Yes, sir; coal, iron in the finished form, etc.

Senator RANDELL. Marble also?

Mr. KREUSI. Marble in great quantities, phosphorus from the great beds in Tennessee. The possibilities of commerce on that river stagger the imagination.

Senator RANDELL. The navigation problem is important in connection with the other problems there.

Mr. KREUSI. It is second only to the agricultural problem. I am interested in the navigation features of that stream, but I think the dominant thing, the big thing, is the possibility of bringing down the cost of fertilizers, and so increasing their use in the United States, by the utilization of that hydroelectric power in the manufacture of fertilizer, and it is something, when completed, which will reduce the cost of fertilizers very materially.

Senator RANDELL. You will then carry that fertilizer by water instead of by rail to other States?

Mr. KREUSI. Yes, sir; we will carry it by water to Illinois and Iowa, and the other States, but Illinois and Iowa will get this fertilizer by water, which is the cheapest kind of transportation.

Senator RANDELL. They fit together?

Mr. KREUSI. They fit together; yes.

Senator RANDELL. Cheap fertilizers and cheap transportation fit together.

Mr. KREUSI. Yes, sir.

These locks were built about in the year 1827 by the State of Alabama, and then our Government exercised control over such rivers as they desired, and they then made the State of Alabama get off the track, and they were built and finished about 1875. I may be wrong about the date, but that would not be essential, the completing of these canals and locks to which you refer. Before this dam was built across the river we managed to get along with navigation in all but the driest seasons. We operated our boats for eight and a half months in the year, and did it successfully, and performed a service in the farmers' interest, and when this is now completed a service will be performed for the farmers all over the United States, because they will get cheap fertilizers by that cheap kind of transportation, namely, water. We did that successfully; that is, navigating the river, until the middle of the war. We thought it would be finished. The Government should not start something that they do not finish. They put that dam across the river. I say this: "You are dogs in the manger," meaning the Government, and not casting any reflection on the committee, "Either get out of that river and turn it back to Alabama and Tennessee and we will build these plants and operate them all, but, if you are going to control navigation in these rivers, finish what you have started."

Senator HARRELD. Are those dams that you built in 1875 still there?

Mr. KREUSI. Yes, sir. They will be 50 or 60 feet under the surface of the water by the time the Government finishes the Wilson No. 2 Dam.

Senator HARRELD. If this obstruction were removed, would those dams be useful?

Mr. KREUSI. Yes, sir; they could be.

Senator HARRELD. Let me ask you another question. How much did the Government expend on Muscle Shoals from the time they took it over up to the present time?

Mr. KREUSI. You mean including the various experiments at nitrate plants, lime quarries, power plants?

Senator HARRELD. Everything.

Mr. KREUSI. I think it is \$105,000,000. There is, however, no use crying over spilled milk. The only thing to do is to complete it.

Senator HEFLIN. The Government has not wasted a dollar if this is completed?

Mr. KREUSI. No, sir.

Senator HEFLIN. If they make fertilizers in time of peace and make that river navigable from Hales Bar down—

Mr. KREUSI. Yes, sir. You will assume charge of the river. Why not do it now?

Senator LADD. You referred to the phosphate. Can you tell us anything about the deposits there, the amount available, and so on?

Mr. KREUSI. In the middle of Tennessee, with Columbia as the head, are the largest commercial beds of phosphate in this country, second in importance, and a close second, to those of Florida.

Senator HARRELD. That is nowhere near this river.

Mr. KREUSI. Not more than 40 miles from Muscle Shoals. It is only 50 minutes from Nashville down.

• Senator SMITH. Is it not true that the phosphates in Tennessee are richer than those of Florida?

Mr. KREUSI. Yes, sir.

Senator SMITH. I know that my State was third in the production, or in the amount of phosphate rock, but Florida was superior in the phosphorous content to us, and Tennessee was the richest we have been able to discover yet.

Mr. KREUSI. I believe that to be true.

Senator LADD. The utilization of this water power in connection with the development of phosphates should reduce the cost of fertilizer?

Mr. KREUSI. Yes.

The CHAIRMAN. As I understand it, the phosphate could be used to make a complete fertilizer.

Mr. KREUSI. Yes, sir. I am not trying to read Mr. Ford's mind, but I am sure he will make compounds and make a complete fertilizer—a completely balanced fertilizer—and the farmers will not have to pay freight on dirt. He will make it balanced so they can ship it all over the country, and it will travel by the cheapest transportation.

The CHAIRMAN. If they get their dirt from the right place—from Nebraska, for instance—they will not need any fertilizer.

Senator CAPPER. I am interested in this Ford proposition. I look upon it with great favor because of the relief it will bring to the agricultural interests of the country, especially the South. The fertilizer problem does not concern my section, but we are told that there is a fertilizer trust. I hear that from a good many sources.

I would like to know whether there is in your section evidence of a fertilizer trust, how it is operating or working, as to the interests of the farmers there, and what relief you think would come from this project if carried out successfully, so far as putting the fertilizer trust out of business?

Mr. KREUSI. I am not a dirt farmer and am not familiar with the operation of the fertilizer manufacturers. I would not be able, out of my knowledge, to answer that question at all. I am sorry, but I know nothing about it.

Senator CAPPER. You hear that statement made?

Mr. KREUSI. Yes, sir; I have heard it made, but I do not know anything about it.

• Senator HARRISON. This dam is two-thirds completed?

Mr. KREUSI. Two-thirds in the difficult part, but not measured in cubic yards. The difficult part is all done, and all the questions of an uncertain bottom, and all questions of uncertain locks have been solved. The great foundation, which

is enormously broad—that is all built, and clean across the river; so while in cubic yards the engineers would tell us it is somewhat less than half complete, the difficult part is completed, and the rest is child's play.

Senator HARRISON. Do you know the percentage of the estimated amount to complete the project?

Mr. KREUSI. No, sir. I understand that you will have many Government engineers here to give you that information.

Senator HARRISON. My impression was that it was two-thirds.

Senator HEFLIN. Mr. Kreusi, I wish you would state to the committee the length of the dam.

Mr. KREUSI. It will be the longest concrete dam in the world—4,700 feet, as I remember the figures—the longest in existence.

Senator SMITH. They found some difficulty, did they not, with the foundations of the previous dam that was built?

Mr. KREUSI. Yes, sir; at Hales Bar.

Millions of dollars were lost because they did not do the work like the engineers did at Muscle Shoals. At Hales Bar they made some drillings and went ahead on the assumption that the bottom was good; they went ahead on the theory that the drillings showed that the bottom was good, and they proceeded with the dam. They found a lot of rotten limestone. That is a limestone country. They found so much that they had to go deeper and deeper, and they spent more money at Hales Bar than was contemplated, and contrary to that at Muscle Shoals. The Government, with extraordinary thoroughness, had the Army engineers make drillings and borings until they found a location which they believed was safe on which to put the foundation, and all their subsequent experience showed that they were justified in making these borings and in the care they took. That part of the dam is finished. It is nothing but child's play now. The dam at the present time comes above the water.

Senator HARRISON. In the previous discussion of this subject quite a lot was made of the fact that the previous dam that was constructed had gone out on account of the insufficient base or insecurity of the foundation.

Mr. KREUSI. No dam has ever gone out or threatened to go out.

Senator HARRISON. As I understand it, the Government laid the foundation and completed all the substantial work.

Mr. KREUSI. The substructure is complete.

Senator HARRISON. So the only thing to be done now is—

Mr. KREUSI (interrupting). The only thing to be done now is to carry it up in the air.

Senator KENDRICK. Do you know how much higher they propose to carry the dam?

Mr. KREUSI. The dam is to be about 97 feet high above the general level of the river.

Senator KENDRICK. It is already above the water.

Mr. KREUSI. Yes, sir; depending on how high the water is when there are freshets.

Senator PAGE. I understand that you have a correct idea of the amount we shall probably have to appropriate to complete this work. How much from the Federal Treasury do you understand is to be appropriated now under the plan, or under the Ford offer?

Mr. KREUSI. I am not associated with Mr. Ford. I am only a private manufacturer at Chattanooga, coming here at the request of Governor Taylor to help, if possible. I understand that Mr. Ford contends that from \$40,000,000 to \$42,000,000 will complete the dam under consideration. This will do everything that you gentlemen have to do; in other words, while the Chief of Engineers or the engineers representing the Government are always very, very extraordinarily conservative, they estimate that it will cost \$50,000,000, while Mr. Ford estimates it will cost from \$40,000,000 to \$42,000,000, a difference of opinion of only \$8,000,000. If I were betting I would bet Ford would build it for less than \$40,000,000.

I am not an engineer and no concrete contractor, but I believe there would be a lot of money made in building that for \$40,000,000. I venture to say that Ford's engineers are safe in estimating \$40,000,000 will finish everything in sight down there. That is no criticism of the Government engineers, who must work on the side of safety; but there is only \$8,000,000 difference in their estimates.

The CHAIRMAN. That is a small item when you consider how we have been figuring in the billions.

Mr. KREUSI. It is small when you compare it with the cost of a new battleship, which costs at least \$40,000,000. In 10 years the battleship is gone. If you put \$40,000,000 here you have conferred a benefit upon posterity. It is always there safe, and conserving money.

Then, here is the great difference: Every time we take a ton of coal out of the ground we rob posterity of coal, and every time we let the waters of these great streams, like the Tennessee, Mississippi, and Ohio, waste themselves into the Atlantic or the Gulf of Mexico, that is economic wealth wasted, but when we conserve them and use them, we are piling up increased taxable wealth for the country, and benefiting the country for all time.

The cost of one battleship will finish the whole thing, and when it is finished you have something for all future generations, but, in the case of a battleship, it goes to scrap in 10 years.

Senator SMITH. In case you wanted to build another battleship, you have the elements there to make the battleship effective, in the form of nitrates.

Mr. KREUSI. Yes, sir.

Governor TAYLOR. I desire to present a young man from Tennessee who has had quite an experience abroad, spending 18 months in France. Major Campbell.

The CHAIRMAN. Will you please give your name and occupation, Mr. Campbell?

**STATEMENT OF ROBERT M. CAMPBELL, BUSINESS ORGANIZER,
JOHNSON CITY, TENN.**

Mr. CAMPBELL. There have been a number of objections urged against the Ford offer. I want to say that the people I have been in touch with have not batted an eye, a single one of them.

I noticed your remark about your interest in this fourth proposal to lease Muscle Shoals, Mr. Chairman. It comes from the Alabama Power Co., and was announced this morning.

If I wanted to delay action on the Ford lease, or defeat it, those are the very tactics I should pursue. I would create a diversion and form a syndicate of men whose names are known in the financial world, and I should submit a proposal which left nothing to be desired. What would it be worth? Of course, we know that Mr. Ford has a great many enemies, but he has a record for doing things, and his record is more assurance to us than we feel the Government can contrive in any way to give us. They say, "Will he make fertilizer?" "Will he guarantee to make fertilizer?" We feel that if Mr. Ford can not do it, it can not be done.

So we believe that these objections that are raised are hardly entitled to consideration in any case.

That is all I care to say.

Senator KENDRICK. Would you assume it might be possible, while he could make fertilizer, he might use the power there for some more profitable business, and don't you believe we should have some assurance that he was going to produce, or employ a reasonable part of the power in the manufacture of fertilizer?

Mr. CAMPBELL. I think he might use this power for any other purpose, but I do not think he will. I think in this matter we must exercise some confidence in Ford; and I think we are warranted in doing that, because, as was pointed out by the governor of Tennessee this morning, Mr. Ford's ambition can not any longer demand money. He must want to perpetuate the Ford name and build a monument, and he sees this opportunity to lay the whole country under obligation to him.

Senator HARRELD. Under the terms of this agreement he can not make fertilizers and sell them at a greater profit than 8 per cent.

Mr. CAMPBELL. That is right.

Senator HARRELD. What assurance have we that his successors will have the same desire to view the matter as you suggest? Is it not true that he could make more money out of anything else than 8 per cent, and is it not possible that his successor will want to make that money and not make fertilizer?

Mr. CAMPBELL. Nothing; but I trust Mr. Ford.

Mr. HARRELD. That is the point.

Mr. CAMPBELL. You have to trust somebody.

The CHAIRMAN. The point that the Senator makes is that Ford is not going to live for a hundred years.

Senator HARRELD (continuing). Granting that he has this ambition; look at this as a commercial proposition and not as an altruism.

Mr. CAMPBELL. That is the actuating motive with Ford to-day.

Senator HARRELD. It may be, but his successors will not have it.

Senator RANSDELL. Will it be possible to have a contract stating that a part of that power shall be used in the manufacture of fertilizer? Will they be willing to do that?

Mr. CAMPBELL. If you can find anybody to do it, if you can get any bona fide offer to do it, then Mr. Ford will meet the offer, unquestionably.

Senator HARRELD. I would feel a whole lot better about it if he would do it.

Senator RANSDELL. He contemplated to do it, as I understand, and he would be willing to bind himself and his successors, so far as he could, by contract.

Mr. CAMPBELL. I do not know anything about that. I applaud Mr. Ford's course in standing firm right now, and in saying that he will not yield an inch, because if he begins to yield now his cause is lost.

Senator HARRELD. Is it not possible that the 8 per cent profit clause in there is detrimental to the contract? Would it not be better if it were stricken out and leave them to compete in the manufacture of fertilizers?

Mr. CAMPBELL. Yes, sir; I think that is true. I think the contract could be improved in many ways, but I think the contract as it stands is well worth accepting. It may not be the best proposition, but it comes from the best proposer.

Senator HARRELD. Is it not possible that the 8 per cent provision will defeat the very purpose of the bill, so far as making fertilizers is concerned?

Mr. CAMPBELL. I would not claim that it is the best possible form, or that it is the best you might receive, but I do think the Government will be wise in accepting that contract. Of course, if they can improve it some, very well, but not let it fall on account of some technicality.

Senator HARRELD. I am not raising a technicality. It strikes me if you put that 8 per cent in there it will not be as desirable or effective, so far as the manufacture of fertilizer is concerned as it would be if you did not limit them to 8 per cent.

Senator SMITH. I am not familiar with that form of the contract. Was that 8 per cent clause put in by Ford or the department?

Senator HARRELD. It is in Ford's proposition that he will produce these fertilizers at not exceeding 8 per cent profit, but there is no binding obligation on him to produce fertilizers at all, and necessarily his successors would go on producing something else. It might defeat the very purpose of it.

Senator HARRISON. Mr. Chairman, it seems to me that some one ought to come before this committee and explain to this committee what Ford wants, and the sooner we get to it the better.

The CHAIRMAN. We will have that done, and it should have been done first.

We will meet to-morrow at 10.30 o'clock.

(Whereupon, at 11.40 o'clock a. m., the committee adjourned until to-morrow, Friday, February 17, 1922, at 10.30 o'clock a. m., for the consideration of other matters.)

MUSCLE SHOALS.

MONDAY, APRIL 10, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to call, at 10.30 o'clock a. m., in room 224, Senate Office Building. Senator George W. Norris presiding.

Present: Senators Norris (chairman), McKinley, McNary, Capper, Gooding, Norbeck, Harreld, Kendrick, and Heflin.

The CHAIRMAN. The committee will come to order.

The origin of the Muscle Shoals investigation came about by a provision of law, section 124, approved June 3, 1916, the same being an act for the making of further and more effectual provisions for the national defense.

This section provided for the increased manufacture of explosives in time of war by fixation of nitrogen from the air and gave authority from the President to locate the plant or plants. The President located them at Muscle Shoals in an official letter dated February 23, 1918.

The Government has spent nearly a hundred million dollars in the improvement down there in the way of machinery and improvement of the river.

We wanted to start out this investigation by the committee by having the engineer in charge of the work at the Government dams there, Colonel Barden, testify. The colonel is here, but before he takes the stand the Senator from that State, Mr. Underwood, is present, and I think it would be proper for him, perhaps, to offer his testimony in the way of an introduction before we start the actual investigation by witnesses.

Senator Underwood, we would like to hear from you.

STATEMENT OF SENATOR OSCAR UNDERWOOD, FROM THE STATE OF ALABAMA.

Senator UNDERWOOD. Mr. Chairman, I am very glad to have the opportunity to say a few words in reference to this very important question. It is not that I am as well qualified to tell the committee the details of the project or the technical information that they will desire to have, as many other gentlemen in the room, because I am not at all a technical man or have not technical knowledge to advise the committee; but I am very much interested in this proposition, and have been for a number of years.

I took a very active part some years ago in the House in trying to secure—and did secure through the House—passage of a bill to establish a nitrate plant to make nitrogen out of the air in this country, instead of relying on the peculiar nitrates.

I was very much interested in the amendment to the national defense act, which is the basis of all this investigation at Muscle Shoals, when it passed the House or when it passed the Senate and became a law some years ago. Of course, I am interested very much in the development of the Tennessee River as a navigation project. I am very much interested locally, as it is my home State, in the development of hydroelectric power, inasmuch as it will build up the State; but primarily, Mr. Chairman, from the very beginning my chief interest in this matter has been in the development of nitrogen as produced from the air—air nitrogen.

I realized a good many years ago that unless we did do something to bring back the depleted soils in this country we were going to be in a very serious condition from an agricultural standpoint. I remember when I was a boy and lived in the Northwest, on those great virgin fields in Minnesota, the prairies up there, that I have seen green wheat fields blowing like billows in

the sea as far as the eye could see across the plains, and my recollection is that at that time those fields produced from 40 to 50 bushels of wheat to the acre. I understand now the production per acre has fallen off to something like 15 and 20 bushels, simply because the soil is depleted. They can not plant legumes in that country. When you get close to the Canadian line cattle raising is not profitable, as it is further south, and they can not diversify their crops because the corn does not grow that far north. Now, that is only an extreme illustration from that end of the line. Of course, the day will come, if artificial fertilizer of some kind is not put into that soil to renew it, when it will be thoroughly depleted and the country depopulated. It may be 100 years from now, or 150 years from now, but the day will come. If artificial fertilizer can not renew that soil in the far Northwest, when the people will have to move out because they won't be able to produce a living.

Now, I have spoken of that first, because I lived in that country at one time, and knew it pretty well. That far northwestern country had an advantage over the fields of the South. It is covered by snow in the winter, and the fertility of the soil is not washed off like it is in the Far South. We have great advantages over the soil in the North because we can plant legumes. We can diversify our crops. We can raise cattle. We have a number of ways of replenishing our soil in the South that they do not have in the Far North; but we have one great disadvantage in that when the winter rains fall they wash the fertility off the soil and unless it is protected it goes out to sea, and that fertility has to be renewed in the way of fertilizer. So that I have regarded this question, Mr. Chairman, of the renewal of the fertility of the soil as one of the foremost questions that confront the American people. The question of the maintenance of an Army and a Navy for national defense is not of greater importance than is the providing for ample, cheap, and satisfactory means of refertilization of depleted soils.

Of course, we know every man who has studied the situation, that in large portion European agriculture is in an intensified form, and that there is a vast deal of fertilizer, in one way or another, goes into the soil. We know that in Germany the very method that has been suggested here has been tried and successfully tried, and the fertilizers are made out of the very products that can be made now at Muscle Shoals if you turn the wheels.

Now, I do not contend, Mr. Chairman, that this one project is going to supply the needs of all the people of the United States, but I do contend that the Government has got to demonstrate that this project is a success and can be successfully carried on before you will get any other money in the United States to go into the question of making air nitrogen and producing fertilizer by that method, because as long as it stands there they will say it is a failure.

Now, I do not come here to throw any rocks or to differ with any of my friends, but I come here to ask you to look the question right in the face. You know a year ago, or a little over a year ago, the Senate of the United States provided the money to finish this Dam No. 2—that is, the necessary amount of money. The first appropriation was \$10,000,000, and we provided for a bill to put that nitrogen plant in operation. Of course, we had a fight in the Senate. We had differences of opinion. I am not here to criticize anybody's opinion that does not agree with us, but I am going back to this proposition, Mr. Chairman. It was the opponents of this proposition who said that it was an absolute waste of money to finish that dam or to operate that nitrate plant—an absolute waste of money—and in the House of Representatives the project failed. The wheels of that plant have been closed for a year. They have been closed for this length of time. They were closed before that. The work on the dam would be nearing completion if, for want of money, it had not been stopped at that time, and, of course, there is a great attendant loss to the Government. If they were right, and it was a waste of money, of course, it ought to have been stopped or to have been junked; but if it is not a waste of money then the Congress of the United States ought to take charge of this matter and put the whole plan through in the most effective way it can at the very earliest moment.

So, of course, I know that there are many people in this country who are opposed to this development. There are a great many people in this country that are opposed to making fertilizer at Muscle Shoals because they think it conflicts with their business. I am in the business myself where a good deal of opposition comes from. I have not got so much of this world's goods, but most of what I have is invested in the pig-iron business, and we make a by-product, and most of the by-product people in the United States are opposed to the

development of this nitrate plant at Muscle Shoals because they think that it will create competition with their business, and they do not want the Government to compete with them in business, or they do not want the Government to turn this plant over to some private individuals to compete with them in their business.

I am not criticizing anybody, but that is a fact that we all know. Those gentlemen have a perfect right to express their opposition, but it is up to the Congress to know whether they think that the stopping of this work in order that they shall not be competitive with some special interest in the country is better for the people of the United States or whether this problem is of such great and momentous importance in the way of revitalizing the lands of the United States and producing cheaper food for the people of this country that Congress should take hold of it and put it through regardless of what opposition may come to it. That is the real question. It is not a local question.

When the national defense act was passed they did not name Muscle Shoals as the place to locate this proposition. It was located at Muscle Shoals because the President and his advisers came to the conclusion that that was the best available site in the United States to establish a plant of this kind; and although I know there are greater powers in the Rockies and the far West, the transportation from them is very difficult, and I am satisfied that every man who has now studied the question realizes that when you take into consideration the transportation from the great water powers of the West to the East, and take into consideration the available amount of water power that can be produced by the money invested, everybody will come to the conclusion that the President of the United States, acting through the War Department, was right when he was ordered to locate a plant to make air nitrogen, when he located it at Muscle Shoals. So I think that that problem has blown by.

Senator KENDRICK. Do you know whether the people in that section were especially interested in having the plant located at Muscle Shoals?

Senator UNDERWOOD. Of course, they have dreamed it for a hundred years. They have dreamed this proposition of this great river, that navigation had been stopped by nature at Muscle Shoals, and, later of the great power that was there. It is the dream of their lives. But I am not arguing it from this standpoint, and I know you are not looking at this problem from the standpoint of the people of Alabama, because it is altogether too big a problem for that. It is either a great national problem or it is nothing. Of course, as I said, the Government has blocked the navigation of that river. I think it is up to the Government to give an open navigation, but that is one of the minor details.

The Government has built a hundred million dollar plant there to make nitrogen in time of war. It could lay there until another war comes without serving the people of this country; but what I came to this committee to say is the great problem here is to serve the American people by producing fertilizer at that plant and demonstrating to the world what can be done. Of course I know that the amount of fertilizer you are going to make at Muscle Shoals is not going to supply the people of the United States, but if you allow it to be developed there and it is shown it can be successfully and cheaply made, and the great agricultural interests of the United States benefited by it, then you are going to have these same plants developed in the Rockies, on the Canadian border, and all over the country where there is available water power to accomplish it; but as long as you put the hand of condemnation of the Government of the United States on this project at Muscle Shoals nobody else will dare go into the business of developing water power and producing nitrogen to make fertilizer for the people of the United States. It is your condemnation, and yet, Mr. Chairman, a year ago there were those in the Congress of the United States and those men in high position in the business affairs of this country that proclaimed—and I have no doubt when they proclaimed it they believed what they said—that it was a waste of money to continue this project; it was a waste of money to develop this nitrogen plant; it was a waste of money to finish the dam, and yet when you would not do it, when the Congress of the United States negatived this proposition and refused to act, and the Secretary of War asked for bids from some individual to take hold of this and finish up what the Government would not do, a man who has been the most successful man in industry in the United States came before the Government of the United States and said, "I will do it if you will give me a chance."

Senator McKINLEY. Will the gentleman permit a question?

Senator UNDERWOOD. Yes.

Senator McKINLEY. Did not that gentleman ask the Government to spend \$10,000,000 of its money before he would do it?

Senator UNDERWOOD. Mr. Ford's proposition, as I understand it, is for the Government to make this development on a scale where the entire navigation would be open, where you can utilize to the highest degree the electrical power, because, of course, if you build only one dam your electric power development, even at that dam alone, will not be commensurate to what it will be if you build two, with the necessary reservoirs involved. His proposal is that this should be developed on a scale where it could really be made useful to the American people, and of course the proposal of the Government was that he was invited in to make this kind of proposal. Mr. Ford did not make the proposal for Uncle Sam to go down in his pocket and put up the money, but the Government of the United States proposed, not to Mr. Ford, but to anybody else that would come here and take this contract off their hands, that they would put up the money to finish it, provided the man who made the proposal would contract to and would pay them back their money with a rate of interest on it.

Senator McNARY. Is not the true situation in regard to that matter that the people of the South who desired the plant completed invited Mr. Ford to come down, and his engineers, to look it over, and he first refused and finally came down at the earnest solicitation of the people of the South?

Senator UNDERWOOD. No, sir; I do not so understand. I will tell you what the facts are.

The CHAIRMAN. Now, gentlemen, let me suggest it was my idea that before we took up any of the propositions, not only Mr. Ford's but several others, to get through with the experts who would show us just what we had down there now. That is the reason I wanted to start out with Colonel Barden, who has charge of the dam proposition down there, and then when we get through with him we will take up not only Mr. Ford's proposition, but every other proposition involved in this investigation. So I would just like to suggest that we do not go too much into that phase of the investigation.

Senator UNDERWOOD. I realize that, and I thank you for the opportunity, but I have got to leave town for a couple of weeks, and part of this program will go on whilst I am absent; and I am not going to trespass on your program, but under those conditions, as I am very much interested, probably you will pardon me if I go on for a few minutes longer. I will not take much time.

The CHAIRMAN. All right.

Senator UNDERWOOD. Now, Senator McNary, I know that what you just said is the supposition of most of the people—that the original invitation came from the South to Mr. Ford to come down there.

Senator HARRELD. Suppose they did. What difference does it make?

Senator UNDERWOOD. It does not make any difference. The southern people would have been glad to invite Mr. Ford. But the original proposition to come was not made by the people of the South. I will tell you how the proposition went to Mr. Ford. We might as well have the record straight, and this is a fact, and what I say you can substantiate by General Beach, Chief of Engineers, by the Secretary of War, and by Mr. Worthington.

When Secretary Weeks made his proposal and advertised in the newspapers that he wanted somebody to bid to take over Muscle Shoals as a private endeavor and develop the nitrate plant and the dam, which was all published in the newspapers, among the other people who made inquiry was the chief engineer of Mr. Ford. He wrote to the War Department asking what it meant and what power they had to dispose of, and the Chief Engineer's office—I don't know whether General Beach himself or not—wrote back and explained the situation, and then he said he would like to have an engineer come to his place of business and explain the situation to him. General Beach did not have an engineer to send. He did not have an engineer that was conversant with the facts, but as Mr. Worthington had been conversant with all these facts from an engineering and a development proposition from the beginning, he suggested that Mr. Worthington go up there, and wrote Mr. Ford that Mr. Worthington would come if that would satisfy him. And this I know, because I myself wrote the letter to introduce Mr. Worthington to Mr. Ford, before Mr. Worthington left. He went there and on that invitation laid the facts before Mr. Ford, explained the situation, and Mr. Ford—before the people of Alabama, so far as I knew, knew that he had any thought about it—came to Alabama to investigate the proposition himself, and then made the proposal before you.

Now, I think it would be nothing short of a crime if this Congress of the United States allows the flag to be pulled down on the Capitol and does not provide for the immediate completion of those dams; but I think it would be equally a crime if this Congress of the United States adjourns and does not determine on a fixed and definite policy to operate that great plant down at Muscle Shoals and make nitrogen in order that the people of the United States may have a cheaper and a better fertilizer, regardless of whose business and whose private affairs are affected.

I am not going into a discussion of the Henry Ford proposal this morning, Mr. Chairman, because you do not wish it. Maybe at a later day, if you will give me the opportunity, I shall be glad to go into the details, but I want to say this to the committee: A year ago I was in charge of the bill in the Senate to provide a Government corporation to conduct this plant. I was earnestly in favor of it, and the Senators who agreed with me between us succeeded in passing a bill in the Senate; but I prefer to have Mr. Ford make this development for the Government, and I will tell you why in just a few words.

I think it is the best proposition that has come before the Congress, if we are not looking at our private interests, if we are not looking at it from a governmental standpoint; but if we think it worth while to produce nitrogen in order that the agricultural people of America may have a cheaper and better fertilizer, if that is the standpoint, then I say Henry Ford's offer is the best one for you to take. I am not raising the question of dollars and cents. Why do I say it? Because any proposition that you go at, that you want to carry through, must have management behind it to make it succeed. If you attempt to carry this through, as I attempted, and some others a year ago by a Government corporation, then you have got the question as to whether you are going to have successful management or not to deal with it. But here is a man that I understand is not only willing to pay back to the Government every dollar that this development cost, with 4 per cent interest on it, and give it back at the end of a hundred years, but is willing to put up \$10,000,000 of his own in a corporation to secure the development of this nitrate plant, not so much in his own interest, because he has agreed that he will not make over 8 per cent profit on it, but in the interest of the people of the United States; and he is willing to bet \$10,000,000 that he makes good; and he is a man that has made good in every industrial proposition he has taken hold of, not only made good but he has got the money and the organization and the power and the force to make good with.

I therefore say, Mr. Chairman, that from my viewpoint, although a year ago I was earnestly advocating a Government corporation, when you have got a volunteer that is willing to risk \$10,000,000 of his own money to make good, who proposes to produce fertilizer at a profit of 8 per cent to himself for the American people, I say that the Congress of the United States owes it to the American people that this proposition should be agreed to, and agreed to now.

I thank the committee very much.

Senator McNARY. Just a word, Senator Underwood.

I agreed with you two years ago, or a year ago, that the Government should undertake the fixation of atmospheric nitrogen and go ahead and complete the plant. I heard you speak just as earnestly on the floor then as you do before the committee now advocating governmental ownership. I think some one asked you the question if the Government could operate this as successfully as private industry, and you said more so, on account of the engineering and chemical problems involved. Have you lost confidence in the Government at this time?

Senator UNDERWOOD. No; and if there was some one, Senator McNary, who was going into this proposition as a business to exploit it himself, I should go back to the old proposition that I had, and say that the Government should operate it for the benefit of the American people; but I realize if you are going to take this and develop this dam and take the nitrate plant and turn it over to private fertilizer industry that has had a monopoly for years, for years to come, to use the Government plant to exploit the fertilizer business for themselves and not for the American people, I would stay where I was a year ago and say that you had better do this by the Government, because, Mr. Chairman—I may be wrong—but for the life of this Nation the creation and maintenance of an Army and Navy are no more important for its future life and development of this Nation and these people than it is to provide them with an adequate opportunity for fertilization of their soil; and the reason I stand

behind the Henry Ford proposition is that that is not his business. He has reached the point in life where I do not believe he is ready to develop this thing from a money-making standpoint, but he is prepared to do a great patriotic act for the people of the United States by limiting the amount of his profits and producing fertilizer for them as cheaply as possible.

Senator McNARY. Referring to the personal equation that enters into it, I think we can all agree here that Henry Ford can not expect to live a hundred years. What are we going to do when Mr. Ford is out of it?

Senator UNDERWOOD. I think this, Senator McNARY, that if Ford organizes this proposition, within the next 5 or 10 years, on the basis of this contract that is provided here, with a limited amount of profit; if he starts the organization with a system of production and delivery that he has and that he can make and maintain, as he has demonstrated in the past, when it is started it will, by its own initiative and its force, carry on for the benefit of the American people. This enterprise, no matter how good it is, or how great, its survival or its death is going to depend on personal organization in the end, if you are going to make fertilizer for the American people; and it is not merely a question of manufacture; it must be delivered, and here is a man who has demonstrated that he not only has the power of manufacturing, but he has the power to go right into every territory and deliver the product of his factory cheaper and better than anybody else.

Now, if you think it is more important to protect the by-product industry that I am to some extent interested in, or some other industry, than to look at it from the broad standpoint that these fields of America must be brought back to their original fertility or the life of the Nation can not survive; if you look at it from that standpoint, then any individual that stands in the way is a negligible proposition.

Senator McNARY. Senator, let me ask you this question: I think we can agree, all of us, that the need of fertilizer is great and important to future production of crops in soil whose fertility has been depleted by long periods of cultivation; but don't you realize that this contract calls for 100,000 tons of fertilizer annually, whereas the annual consumption of this country is about 8,000,000 tons, and the adjoining State of Georgia uses three and a half times as much fertilizer as can be made at this plant under Henry Ford's proposition?

Senator UNDERWOOD. I am not going to discuss the details of that, Senator, because I am not clear in my own mind. I have not got sufficient information to do that; but my own understanding is that a good deal more fertilizer can be produced at this plant than has been generally accredited to it. But that is not the proposition. If you fail to produce it at this plant, and successfully produce it, then you put a black eye on the whole proposition, and nobody else is going in. The great water powers in your State—and you have some of the greatest in the Union—will never be developed along this line for the benefit of your people if you fail at Muscle Shoals; but if somebody can prove that it can be done, and done successfully, at Muscle Shoals, in the interest of the people, then you make them flourish all over the United States.

Senator McNARY. I agree with you in that, but I stand where I did two years ago. I have not lost faith in the Government in this undertaking.

Senator UNDERWOOD. Of course that is a question for the committee to decide. I am giving you my viewpoint. I am not criticizing your viewpoint. I am merely saying that the time has come when action is demanded; that we have got no right to wait longer, and that we ought to determine this question before the Congress adjourns.

Senator McKinley, did you have a question?

Senator McKINLEY. Don't you think it is very selfish in the fertilizer trust to oppose this plan when this plant could not possibly fertilize one acre out of every 300?

Senator UNDERWOOD. Well, I think there is going to be room enough. I don't think the development here is going to destroy the fertilizer industry. There is going to be room enough for them to operate. I don't think it is going to destroy the by-product business. I think these people that are in the same business that I am are very foolish people to get up here and spend their money and their time in fighting this proposition when if you would get a cheap fertilizer it would make more demand for fertilizer, and wake the American people up to the necessity of its use. The world has never turned backward by finding a new thing or carrying on a higher development.

The CHAIRMAN. I think it is conceded that in Mr. Ford's proposition the maximum amount of fertilizer that can be made is not provided for. He ex-

pects to do other things, of course. Now, if the Government, through some instrumentality of its own, works these improvements to their capacity of fertilizer directly, they would produce many times more fertilizer than Mr. Ford proposes to produce. Is not that true?

Senator UNDERWOOD. Oh, I think that is so; but the details of this proposition I am not going into. I take it, your committee will take that question up with Mr. Ford and his experts and the other experts here, and I am not prepared to answer the questions about the details of what you should agree on. I am merely saying that I believe the Ford proposition is the best one. If you can come to a proper agreement about details, of course you will want a good man, a man of great executive ability, who can carry this through to success.

The CHAIRMAN. I agree with everything you have said in regard to the ability of Mr. Ford. I think he is a remarkable man. But I think, like Mr. McNary, that his years of life are not very many now. He will not live a hundred years to carry on this contract. And there is another thing that comes in as very important in the consideration of the Ford proposition, unless he modifies it, and that is the Gorgas steam plant. I don't intend to go into that now, but that has been brought up.

Senator UNDERWOOD. That is another detail, Mr. Chairman, that you have got to take up.

The CHAIRMAN. Of course, we can not change Mr. Ford's proposition, and unless he changes that I, myself, hardly see how we can make good on what he demands of the Government in regard to Gorgas.

Senator UNDERWOOD. Those are details that I can not go into. Of course, I can not change Mr. Ford's proposition, and you can not change it, but if you lay your proposal before Mr. Ford's representatives, they may change it. I am not going into the details, because I can not speak in details.

I thank you very much.

Senator HEFLIN. Before my colleague leaves, I just want to remark, in connection with what the chairman said, that Mr. Ford would not live a hundred years, that Mr. Ford's organization would carry on the work, and he has stated that his son would succeed him in the work. He is quite a young man.

The CHAIRMAN. His son may not be any better man than I am, and he may, of course, be just as good as his father. It all depends on that. That has not been demonstrated. Maybe that will appear in the hearings.

Senator GOODING. Mr. Chairman, knowing Senator Underwood's spirit of fairness in all matters, and I say that without reservation, because in my short time that I have been in the Senate I know that he has tried to be fair in everything, in all big questions and all other questions, as far as that is concerned, I want to correct him as far as the statement that he makes that up in the Northwest, they can not grow cattle to the extent that they do in the South, and corn and those things. I want to say, Senator, since your boyhood days those great wheat fields up there in Minnesota, and all through the Northwest, have developed into an agricultural country. They grow corn. They have corn up there that matures in 90 days. And they grow clover, and, I think, likely the greatest State in all the Union for clover is Minnesota. In those prime forests up there it is native. It comes in wild when the timber is removed. So that they have those plants that give fertility to the soil to a very large extent up there. I merely wanted to make that correction, because a transformation has taken place since your boyhood days. When you were there you saw only the wheat fields. Cattle are grown in the northern country there to higher perfection than any other place in any of the States in the Union. That is true in Canada, too. They have wonderful grasses up there. The weight of cattle is anywhere from 100 to 200 pounds higher than even the prime steer that comes from the South.

Senator HARRELD. A little fertilizer would help, though?

Senator GOODING. Sure.

Senator UNDERWOOD. The fertility of that soil is being depleted.

Senator GOODING. I agree with you thoroughly. There are two sources. One, of course, is commercial fertilizer, and the other is from the live stock, and I want to develop and encourage the live-stock production. I agree with you that civilization itself depends upon the fertility of the soil. It is the history of the world that when soil fertility has gone backward civilization has gone backward with it. When Rome fell and went down its soil was only producing 4 bushels of wheat to the acre. That is what has happened to every country. It is a matter of history, as far as that is concerned, on which I think we all agree.

The CHAIRMAN. Colonel Burden, we will be glad to hear from you.

**STATEMENT OF W. J. BARDEN, COLONEL, UNITED STATES ARMY,
CORPS OF ENGINEERS, STATIONED AT FLORENCE, ALA.**

The CHAIRMAN. I want to ask you first, Colonel, your position, for the record.

Colonel BARDEN. My name is Col. W. J. Barden, Corps of Engineers. I am in charge of the Engineer district at Florence, Ala., which district was created for the purpose of construction of Dam No. 2, or the Wilson Dam.

The CHAIRMAN. Have you been in charge from that time on?

Colonel BARDEN. No, sir; I have been there since September, 1920.

The CHAIRMAN. Who preceded you?

Colonel BARDEN. Col. Lytle Brown.

The CHAIRMAN. Where is he?

Colonel BARDEN. He is now at Fort Leavenworth.

The CHAIRMAN. Have you been there since the beginning of the work on the dam?

Colonel BARDEN. No, sir.

The CHAIRMAN. You took it when he left?

Colonel BARDEN. When he left; yes, sir.

The CHAIRMAN. You were not connected with it up to that time?

Colonel BARDEN. No, sir; that was my first connection—in September, 1920.

Senator HARRELD. Are you and he the only ones who have had charge of the work since it began?

Colonel BARDEN. No, sir. When the work was ordered started in the early part of 1918, Col. H. L. Cooper, who at that time had a commission in the Army, but who is now a consulting engineer in the city of New York, was sent down to start the work, and he was there for a short time. The work was suspended shortly thereafter on account of the fact that those who had charge of the priority of supplies of various kinds decided that the materials that would enter into the construction of the dam were more needed for other purposes, and the construction of the dam was suspended until some time in the fall.

The CHAIRMAN. What year?

Colonel BARDEN. Of 1918. After the armistice; then it started up again that winter.

Senator HARRELD. Under whom?

Colonel BARDEN. It was started up again under Maj. D. A. Watt, who was also a temporary officer. Major Watt was succeeded by Col. J. B. Cavanaugh May 1, 1919, and the latter by Col. Lytle Brown in July of that year. Colonel Brown remained in charge until September of 1920.

At the risk of some repetition of what I may have said to the members of the committee when they were down there—

The CHAIRMAN. Let me suggest to you now that you forget that you addressed anybody down there, or that you talked to us, or showed us anything. There are some members of the committee who have not been there, and we want your testimony for the record as much as anything else, so anybody can read it. So talk to us just as though we never had been there.

Senator HEFLIN. Explain it just like you did down there.

The CHAIRMAN. Yes.

Colonel BARDEN. The Holston River rises in southwestern Virginia and the French Broad in western North Carolina. These unite $4\frac{1}{2}$ miles above Knoxville to form the Tennessee. The latter flows southwest across the eastern part of the State of Tennessee into northern Alabama, thence generally westwardly to the northeast corner of the State where for a short distance it forms the boundary between Mississippi and Alabama, and thence north across Tennessee and Kentucky to the Ohio at Paducah, about 44 miles from where the latter empties into the Mississippi.

The total length of the Tennessee is 652 miles. It is 184 miles from Knoxville to Chattanooga, 208 miles from Chattanooga to Florence, and 256.5 miles from Florence to Paducah.

The total drainage area is 40,570 square miles and the low-water discharge at the mouth is about the same as that of the Ohio at that point.

The Holston River is not navigable for any considerable distance, but the French Broad River is for a distance of about 70 miles to Leadvale, Tenn. The Tennessee River in its original condition was navigable throughout the year from its source to Chattanooga for light-draft traffic. From Chattanooga to Hales Bar, 33 miles, where the river breaks through the mountains, the slope was steep and the current swift but light-craft navigation was possible, with some difficulty, throughout the greater part of the year. From Hales Bar to Browns

Island, or the Muscle Shoals section, the slope was moderate, but the river was obstructed by gravel and rock bars. Light-draft navigation was, however, possible throughout the greater part of the year over the whole of this section of 138 miles. The Muscle Shoals section extends from the head of Browns Island to Florence, a distance of about 37 miles. This consists of a series of rock shoals with steep slopes, and very swift current and formed a complete barrier to upstream navigation at all times and to downstream traffic except at high stages, and then only at great hazard. Between Florence and Riverton, 30 miles, there were two serious obstructions, Colbert and Bée Tree Shoals, which formed a complete barrier to navigation at low-water stages, but the entire section was navigable for traffic in both directions at medium high stages.

From Riverton to the mouth there were gravel bars and a rock bar at Big Bend Shoals, but the river was navigable throughout the entire length of this section, 227 miles, except at low-water stages.

The river has been under improvement for many years. Above Chattanooga the project provides for a 3-foot depth except for a lock and dam at Caney Creek, about 96 miles above Chattanooga, which will provide a 6-foot depth for about 25 miles. The project for this section of the river is not completed, but the 3 feet is available for about six months of the year and somewhat less for the remainder of the year.

Below Chattanooga a dam for power and navigation purposes has been constructed at Hales Bar, 33 miles below Chattanooga. The gates, valves, and operating machinery of the lock were provided by the United States, but all the rest of this work was constructed and paid for by private interests (Chattanooga & Tennessee River Power Co.).

Senator NORBECK. I beg your pardon. What proportion, about, did the Government pay of the full cost?

Colonel BARDEN. The cost to the United States is given as \$236,888 and the cost to the company at \$3,686,700, exclusive of the power-house superstructure and installation, which would be a great deal more.

Mr. WILLIAMS. I believe the total cost, Colonel, is \$11,000,000.

Colonel BARDEN. Yes.

This dam gives 6-foot navigation to Chattanooga (lock 60 by 267 feet). The lift at low water is 37½ feet.

The CHAIRMAN. That lock is not big enough to take a vessel through as large as the proposed lock at Wilson Dam, if you utilize the entire lock at Wilson Dam, is it?

Colonel BARDEN. It is the same width but not quite so long.

Senator HEFLIN. The same size vessel will go through, then?

The CHAIRMAN. No; it can't go through.

Colonel BARDEN. The length is less.

The CHAIRMAN. The proposed lock at Wilson Dam is 300 feet?

Colonel BARDEN. Yes.

The CHAIRMAN. This lock at this present dam is 267 feet?

Colonel BARDEN. That is it.

The CHAIRMAN. Can you tell us, Colonel, how much power is developed at this dam you are speaking of, owned by private parties, and what it is used for?

Colonel BARDEN. I think the installed capacity is about 45,000 horsepower. The power is all sold, or practically all, to the Tennessee Power Co., which supplies power to Chattanooga, Nashville, and other portions of the State of Tennessee.

Senator NORBECK. How far is it from Nashville to this power plant?

Colonel BARDEN. I think it is about 100 miles. That development at Hales Bar is only one of the sources of power of the Tennessee Power Co.

Senator HEFLIN. Will this lock and dam at Chattanooga be sufficient to carry vessels up the river?

Colonel BARDEN. I think so; yes, sir. It might not be possible to take as many boats through at a time.

Senator HEFLIN. But it will take through any vessel that will be used on that river for navigation purposes?

Colonel BARDEN. I think so.

The CHAIRMAN. There are Government vessels there on that river now that run through the locks 300 feet long that could not go through this lock. The party visiting down there rode on the vessel up to the Gorgas steam plant on the Warrior River, and that was only one of quite a lot of vessels that are navigat-

ing that river and run from there way down to New Orleans, as a matter of fact. They are 300 feet long.

Senator HEFLIN. That vessel was not 300 feet long.

The CHAIRMAN. That vessel was 300 feet long that we were on, Senator.

Colonel BARDEN. I may be mistaken about that.

The CHAIRMAN. As a rule, I think 264 feet would take everything through there. In fact, you could not use any vessel longer than 264 feet if you had any one lock in your system that was only that long.

Colonel BARDEN. I will say this, though, that it is comparatively easy and inexpensive to increase the length of a lock, whereas to increase its width would be very difficult.

Senator HARRELD. You could increase the length so that they could carry vessels as long as the one at Muscle Shoals?

Colonel BARDEN. That is right; yes, sir.

From Hales Bar to the Muscle Shoals section the existing project calls for two low dams with locks 60 feet by 265 feet, or the same size as those at Hales Bar.

The CHAIRMAN. Those are locks independent of this Muscle Shoals improvement of which we are speaking now?

Colonel BARDEN. Yes, sir. One of them is at Widows Bar and the other at Bellefonte Island. The lift in each case is from 8 to 9 feet.

The CHAIRMAN. No power?

Colonel BARDEN. No power. It will extend the 6-foot navigation from Hales Bar down to Bellefonte Island, 39 miles. Construction work on the Widows Bar lock has been started, but preliminary work only has been done at Bellefonte. Three additional locks and dams between Bellefonte and the Muscle Shoals section have been recommended to secure 6-foot navigation, but they have not been authorized, and the project calls for open-channel work only to secure a 5-foot channel. The actual condition is that a 3 to 4 foot draft is available for about six months, with lesser depths for the remainder of the year. It is quite possible that instead of these five low dams two higher dams might be used, at which power could be developed. A new survey of the river is now being made by the district officer at Chattanooga, and undoubtedly any further action by Congress would await his report.

Skipping for the moment the Muscle Shoals section, from Florence to the mouth the project calls for a channel 6 feet deep at ordinary low water, and 5 feet deep at extreme low water, to be secured by open-channel methods, except at Colbert and Bee Tree Shoals, where a lateral canal 8 miles long with one lock is provided. The lock is 80 by 287 feet, with 6 to 7 feet on the miter sills. The canal is completed and the open-channel work about 80 per cent finished. Four-foot navigation is usually available from Florence to the mouth throughout the year, and 6 foot for about eight months.

Muscle Shoals section: The shoals in this section (Elk River, Big Muscle, and Little Muscle) are caused by hard flinty rock strata which have caused the river to widen out in places to nearly 2 miles. The total fall in the 37 miles is 134 feet. As already stated, upstream navigation was never possible. Downstream navigation was occasionally attempted by rafts and light vessels, but always with great risk.

Efforts were made at an early date to pass boats safely around the obstructions by a canal with locks, and by the act of Congress of May 23, 1828, a grant was made to the State of Alabama of 400,000 acres of the public land to be sold and the proceeds applied to that purpose. Work was begun by the State on the Big Muscle Shoals section in 1831. This canal was 60 feet wide and 6 feet deep, with locks 32 feet wide, 120 feet long, and 5 feet lift. It was opened to navigation about 1836, but the obstructions in the river above and below limited navigation to certain stages of the water. It appears to have been used for a short time only, after which, no funds being appropriated for its maintenance, it soon fell into decay.

In 1875 work was commenced on the present canal, which consists of two sections, one on the north bank, 14½ miles long, with a lift of 85 feet in nine locks, overcoming Big Muscle Shoals, and one on the south bank, 2½ miles long, with a lift of 17 feet in two locks, at the Elk River Shoals. The two sections are 8 miles apart. The work was completed in 1890, at a total cost of \$3,191,726.50. The original project called for another section of canal to overcome Little Muscle Shoals and carry the improvement to Florence, but this was changed to provide for open-channel work.

The canal proper gives 5 feet navigation, but, owing to deficient depth in the river between the two sections and below the lower section to Florence, the minimum available depth throughout the year is less than 2 feet; 3 feet is available about six months and 4 and 5 feet for shorter periods. Navigation is now entirely blocked by the Wilson Dam.

Commerce: The commerce on the river above Chattanooga for the last five years was reported as follows:

	Tons.	Passengers.
1916.....	345,604	2,240
1917.....	613,243	592
1918.....	529,299	70
1919.....	589,060	634
1920.....	581,055	1,855

From Chattanooga to Riverton (except Muscle Shoals section).

	Tons.	Passengers.
1916.....	208,443	10,169
1917.....	170,968	27,183
1918.....	141,486	22,173
1919.....	164,250	19,215
1920.....	185,242	20,434

This includes car ferry service moving 22 miles on the river, Gunter'sville to Hobbs Island.

Through Muscle Shoals Canal it was very small.

	Tons.	Passengers.
1916.....	10,439	60
1917.....	8,677	18
1918.....	5,982	0
1919.....	8,225	0
1920.....	8,127	0

Below Riverton:

	Tons boated.	Tons rafted.	Passengers.
1916.....	328,989	74,589	23,228
1917.....	380,175	36,129	15,566
1918.....	239,241	41,361	5,590
1919.....	237,886	5,873	5,728
1920.....	183,601	41,584	3,394

Development for power and navigation: The question of the development of this section for the combined purposes of power and navigation has been under consideration for many years and has been the subject of numerous investigations and reports both by private interests and the Engineer Department under instructions from Congress. The first official investigation was in accordance with the provision in the rivers and harbors act of March 2, 1907, that "the Secretary of War may appoint a board of engineers whose duty it shall be to examine the present condition of the United States Canal and the Tennessee River from the head of Elk River Shoals to the Florence railroad bridge * * * with a view to permitting the improvement of the above-described stretch of said river by private or corporate agency in conjunction with the development of water power by means of not more than three locks and dams; and the said board may examine any plans presented by such agency

and shall report whether the same, if constructed, can, without injury to navigation, or with advantage thereto, be used to develop water power, and what portion, if any, of the expense of the work should be borne by the United States." The width of the river made very long and consequently expensive dams necessary, so that private interests were apparently unable to finance the entire work nor even such portions of it as were necessary to meet what the Engineer Department felt it could recommend as a proper expenditure for navigation.

The matter seemed, however, in a fair way for settlement about the time of the passage of the national defense act, in 1916. An offer had been received from the Muscle Shoals Hydroelectric Power Co. in 1913, in accordance with advertisements issued under instructions of the Committee on Rivers and Harbors, House of Representatives. A favorable report had been made on this proposition by the Engineer Department in 1914, which was published in Committee Document No. 20, House of Representatives, Sixty-third Congress, second session. This report, however, suggested additional borings and these were made and a further report submitted as directed by the rivers and harbors act of 1915. This report was made in March, 1916, and published in House Document 1262, Sixty-fourth Congress, first session.

The project embraced a lock and low dam (No. 1) just above the Florence Bridge for navigation only and two high dams (Nos. 2 and 3) with locks for navigation and power.

The total cost of the locks, dams, and power-house substructures was estimated at (p. 35) \$19,000,000, and of the power-house superstructures and hydroelectric equipment, which was to be paid for entirely by the company, at (p. 164) \$15,327,000; total, \$34,327,000.

NOTE.—The present estimates for the complete work are, lock and dam No. 1, \$1,400,000; No. 2, \$45,500,000; No. 3, \$25,000,000; or a total of \$71,900,000, which, in view of increased costs since the date of the original estimate compares favorably therewith.

The company was to contribute \$3,000,000 in cash toward the cost of the first item and to make certain stated annual payments sufficient to amortize at 3 per cent in 100 years the sum of \$7,128,000, which left as the cost to the United States for the combined works, \$8,872,000. This latter figure was approximately that which had been determined by the Board of Engineers which had investigated the matter as representing the value of the improvement to navigation. Reference is made to House of Representatives, Committee on Rivers and Harbors, Document No. 20, Sixty-third Congress, second session. It was approximately the cost of extending the navigation from the lower end of the present canal down to Florence and from the upper end of the canal to Flint River, this section being that which would be covered by the combined power and navigation scheme—about 80 miles. But this would have provided for a 5-foot depth only as against the 6-foot depth and much better channel that would be offered by the power dams.

The Company was also to pay to the United States, after a certain amount of installation had been completed, 35 cents per horsepower per year of installed capacity (p. 41). This amount the district engineer, Major Burgess (p. 37), estimated would amortize something between \$1,778,000 and \$5,500,000, thus further decreasing the ultimate cost to the United States so that the total would be between \$3,350,000 and \$7,100,000.

In forwarding the report the Board of Engineers for Rivers and Harbors concurred with the favorable report of the district engineer, but suggested, in view of the provisions of section 124 of the national defense act, which was then pending, that action be suspended as it might be decided that this Muscle Shoals power should be utilized by the United States for a nitrate plant. The Chief of Engineers concurred in this recommendation.

Subsequent developments are now quite generally known. The national defense act was passed with the \$20,000,000 item for a nitrate plant. A commission or commissions were appointed to investigate the subject, but no definite action was taken until this country entered the war. Nitrate plant No. 1 was then established at Sheffield, and later No. 2. It is understood that no money from the national defense act was used on No. 2, all the expenditures there and most of those at No. 1 having come from war appropriations. The construction of this dam—No. 2, or Wilson Dam—was ordered by the President on February 23, 1918, under the authority contained in this provision of the national defense act, presumably to furnish cheaper power for nitrate plant

No. 2. All the money spent here is from that fund. We have had a total allotment of \$17,159,610.42, of which \$16,890,507.46 has been expended or obligated, leaving an available balance on April 1 of \$269,102.96.

The CHAIRMAN. Have you reached a point, Colonel, where you have just gotten up to what we are considering here?

Colonel BARDEN. Yes, sir. I will now describe what has been done.

The CHAIRMAN. It is now nearly 12 o'clock, and probably we had better stop at this point. Your testimony to-morrow will commence where you left off, and will be a consideration of the Wilson Dam, as I understand.

Colonel BARDEN. Yes.

(Whereupon at 11.55 o'clock p. m. the committee adjourned to 10.30 o'clock a. m. to-morrow, Tuesday, April 11, 1922.)

MUSCLE SHOALS.

TUESDAY, APRIL 11, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in Room 224, Senate Office Building, Senator George W. Norris (chairman) presiding.

Present: Senators Norris, McKinley, McNary, Capper, Keyes, Gooding, Norbeck, Harreld, Harrison, Heflin, and Caraway.

The CHAIRMAN. The committee will come to order, and Colonel Barden will proceed with his testimony.

STATEMENT OF W. J. BARDEN, COLONEL, UNITED STATES ARMY—Resumed.

The CHAIRMAN. Colonel, when we adjourned you had just reached the point where you were going to take up this Wilson Dam, had you not?

Colonel BARDEN. Yes, sir; the dam is divided into three parts: The lock on the right bank of the river; the spillway dam, which occupies the northerly three-fourths of the river bed; and the power house, which continues the dam to the left or south bank of the river. All these parts are spanned by a highway bridge. Jacksons Island separates the river into two channels at the site of this work.

The total length, bank to bank, is approximately 4,500 feet. The dam section is 2,890 feet long, and the power house 1,184 feet, the remaining distance being taken up by the lock and abutment connections. That is shown in that diagram up there [indicating].

There are two locks in tandem; that is, one below the other; each 300 feet long by 60 feet wide, with $7\frac{1}{2}$ feet on the miter sills, and a lift of $45\frac{1}{2}$ feet, or a total of 91 feet for both.

The upper lock will be spanned at its upper end by a bascule bridge, carrying the highway across it from the north bank to the concrete-arch bridge, which spans the remainder of the entire structure. The dam is composed of two sections, the nonoverflow and the overflow or spillway section. The former, adjacent to the lock, is only 180 feet long, extending to the original bluff line, where it connects with the spillway section. Both sections are nonreinforced gravity structures, surmounted, as already stated, by a concrete-arch bridge. The spillway section provides for the regulated discharge of excess water over the crest by means of 63 controlling gates, in order to maintain the pool above the dam at a fixed elevation of 501 feet. The pool extends upstream to the site of the proposed Dam No. 3, 14.7 miles, and will have a surface area of 14,037 acres. These crest gates are 38 feet wide by 18 feet high. The total height from the river bed to the top of the gates or pool elevation is 97 feet. The roadway is some 20 feet higher. The foundations extend 15 to 16 feet into the bedrock. The width of the dam at the bedrock is 101 feet, and the apron 59 feet wide, making a total width of 160 feet. The maximum head of water on the turbines will be 96 feet and the minimum 68 feet.

The power-house section is a continuation of the dam, with a slightly different cross section, with a building on the lower side to house the machinery. The arch bridge and roadway are also carried across it. It is pierced by three penstocks for each generating set, each about 12 by 16 feet in size, which carry the water to the turbines. That [indicating] is a cross section of the generating sets. The electrical transformer and distributing apparatus will be located on the bluff overlooking the power house. A railway will be built, terminating

beneath the cranes of the power house, and an ice and trash fender will extend from the north end of the power house to the south bank of the river.

The turbines are 30,000 horsepower. The generators are 25,000 kilowatts, 12,000 voltage. The total weight of the rotating parts is nearly one-half million pounds.

As preliminary to actual construction work, a camp had to be constructed and plant assembled and erected. The number of camp buildings is over 500, there being 30 permanent houses. There are about 5 miles of sewer, 6 miles of water main, 7 miles of road, 28 miles of railroad track of a permanent nature, standard gauge, connecting with the Southern Road at Sheffield through nitrate plant No. 2 and with the Louisville & Nashville Road at East Florence.

There are three mixing plants, one on the north side, one on Jacksons Island, and one on the south side; a crushing plant on Jacksons Island; and a quarry on the north bank of the river a short distance above the dam. There are machine shops, warehouses, etc., sufficient for all needs. The sand and gravel is secured from the bed of the river about 8 miles below Florence by hydraulic dredges. It is washed and screened at the site where dredged and carried to an unloading dock just below the Florence Bridge, where it is unloaded into bins and thence discharged into cars and carried to the site of the work.

The work as a whole is about one-third completed. There will be, when completed, a million and a quarter yards of concrete—

Senator GOODING (interposing). Now, are you discussing all the dams?

Colonel BARDEN. There is only one dam on which work has started, Senator; that is Dam No. 2.

The CHAIRMAN. Before you came in, Senator Gooding, he had started on a discussion of what is known as the Wilson Dam, or, technically speaking, Dam No. 2, and that is the only one he has anything to say about just now.

Senator GOODING. You say that a third of that is completed—that one dam, and not the whole works?

Colonel BARDEN. Yes, sir; a third of this one dam.

Senator GOODING. I just wanted to get that clear.

Colonel BARDEN. Yes, sir. No work has been started on either of the others.

Senator CAPPER. Has the War Department estimated the cost of completing that dam?

Colonel BARDEN. Yes, sir. I am going to go into that a little later.

We have already placed 263,000 yards of concrete, leaving slightly less than a million yet to be placed. There will be a total of 620,000 yards of rock excavation, of which 255,000 yards, or 41 per cent, have already been completed.

Of the 4,000 feet of foundation in the river bed about 2,700 feet has already been completed.

The committee will understand, of course, that the foundation work is really the most difficult part of the structure.

The CHAIRMAN. That is below the water?

Colonel BARDEN. Yes, sir. Cofferdams have to be built and the water pumped out and work done in the dry.

The CHAIRMAN. Wherever you put in this concrete below the surface of the water you have had to absolutely do dry work?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. You surrounded it with cofferdams?

Colonel BARDEN. We surrounded it with cofferdams and pumped the water out.

Senator GOODING. Your borings all showed that the rock here is continuous, of course?

Colonel BARDEN. Oh, yes.

Senator GOODING. To what depth did your borings go?

Colonel BARDEN. They were made in 1916. They went to 100 feet depth. The river bed is solid rock.

Senator GOODING. Yes; that is my understanding; and that thickness is sufficient, of course?

Colonel BARDEN. The thickness is indefinite.

Senator GOODING. Indefinite?

Colonel BARDEN. Yes.

The CHAIRMAN. At some time, Colonel—I don't want to interfere with any order that you have in your mind—I want you to tell the committee before you finish the condition that is there now and just what you had to do in letting the water in where you had already pumped out the cofferdams, and what delay there has been there.

Colonel BARDEN. Yes, sir; I will take that up later.

The CHAIRMAN: All right.

Colonel BARDEN. I would like to make a little statement about available power, because there have been some published statements concerning it which I think have, perhaps, been somewhat misleading.

We have available daily gauge readings at Florence from November 7, 1871, to the present time, or for a period of over 50 years. Discharge measurements have been taken at intervals for a number of years, and a rating curve established giving the flow at all stages. The horsepower available depends on the fall or head at the dam and the discharge.

The gauge readings have been very accurately tabulated and a power curve determined showing the amount available at all stages, and the percentage of time, based upon the 50-year record, that any particular amount will be available.

Primary power is that available every day in the year, namely, that resulting from the minimum flow of the river. Secondary power is that available a portion of the time only, varying, of course, from small to large amounts as the river rises and the flow increases.

We have taken as the primary power at Dam No. 2, 87,300 horsepower. This amount has been available for 99.4 per cent of the time for 50 years. In other words, there were 101 days in that period when a less amount was available. It is not, then, the absolute minimum, but is believed to be very conservative; 100,000 horsepower, which has often been spoken of as the primary power, would be available a little more than 97 per cent of the time.

In this connection I noted in reading the regulations of the Federal Power Commission, established by the Federal water power act of 1920—

Senator McNARY (interposing). What would be the horsepower available 100 per cent of the time.

The CHAIRMAN. Practically 87,300.

Colonel BARDEN. That is 99.4 per cent of the time.

Senator McNARY. That shows a little hiatus.

The CHAIRMAN. A little; yes.

Colonel BARDEN. At the lowest gauge readings of which there are any accurate records, minus 0.8 on the Florence gauge, the power would be 71,800. There was a period in 1904 when the gauge readings were inaccurate, and we can not say what was the absolute minimum then—that was a very low period. It is possible that the flow might have been somewhat less at that time, but we are not able to state.

Senator GOODING. 1884, did you say. What year?

Colonel BARDEN. 1904.

Senator McNARY. What is the maximum primary power at Dam No. 2, according to the readings, which have been covered 10 years?

Colonel BARDEN. Well, there is no maximum primary. The primary power is always a minimum. That is, you can only have that at extreme low water.

Senator McNARY. I understand that thoroughly, from a technical standpoint, but what is the highest maximum power that you have at flood tide that you could develop at Dam No. 2, known as the Wilson Dam?

Colonel BARDEN. The maximum installation that is contemplated is 624,000 horsepower.

The CHAIRMAN. That is your installation, Colonel. It would be more than that, as a matter of fact, if you installed more machinery, would it not?

Colonel BARDEN. Oh, yes.

Senator GOODING. My understanding of the matter is that there will be no flood; that is, you are going to control the flood?

Colonel BARDEN. No, sir; there is no provision for flood control.

Senator GOODING. Is there not? I thought some of these dams would act as reservoirs in order to control the flood?

Colonel BARDEN. Not these dams that are included in this project, Senator.

Senator McNARY. Nothing in the Ford offer contemplates impounding water, nothing to prevent the flow of the water of the Tennessee River around Muscle Shoals?

Colonel BARDEN. As I understand it there is nothing in the offer itself.

The CHAIRMAN. There is nothing in any of the offers.

Senator GOODING. That subject has been discussed, however.

The CHAIRMAN. That is included in the bill that I introduced yesterday.

Senator McNARY. That is the chairman's idea.

The CHAIRMAN. As a matter of fact, it has been discussed a great deal. When the colonel gets through with his description of Dam No. 2 I want to ask him about it if he knows anything about it.

Senator McNARY. I would like to know the maximum horsepower at the high stage of water.

Colonel BARDEN. We have carried our table only down to 1,106,000 horsepower. That is available about 7 per cent of the time.

Senator McNARY. That is, with this whole power in use at one period?

Colonel BARDEN. The river would be discharging 139,300 cubic feet a second, which is not an unusual discharge.

The CHAIRMAN. That is a million and what?

Colonel BARDEN. One million one hundred and six thousand horsepower.

The CHAIRMAN. That, of course, would be available so short a time in the year that it is practically useless?

Colonel BARDEN. Yes, sir; it is not commercially feasible.

The CHAIRMAN. There is only one way to make that practicable, and that is to equalize the flow of the river?

Colonel BARDEN. Yes, sir; and equalizing the flow of the river, of course, would not give as great a power as that at any one time.

The CHAIRMAN. No; I understand that. It would take it off at some place and put it on at a lower place?

Colonel BARDEN. Yes, sir; it would give a larger minimum or primary power.

Senator GOODING. I suppose the load in the South would be somewhat equally distributed over the entire year?

Colonel BARDEN. Yes, sir.

Senator GOODING. In some of the northern States when we get to using electricity for heat we can use a heavier load in the wintertime than in the summer time; but that would not be true of the South, would it?

Colonel BARDEN. I hardly think so.

Senator GOODING. Your load would be even throughout the whole year?

Colonel BARDEN. I think so.

Senator HARRISON. I understood that Mr. Mayo had discussed that the other day and said that the people of Chattanooga were going to cooperate, and that it was in the Ford plan, although it was not in the proposal.

The CHAIRMAN. That may be. There are a great many things in the plans or in the idea of Ford that he is going to do that are not in his offer.

Senator GOODING. What I understand is that there will be an improvement of navigation on the Tennessee. Of course there is a tremendous amount of water that increases the flow of the Tennessee River to a great extent for a certain length of time.

Senator HEFLIN. The completion of the Wilson Dam and Dam No. 2 makes the river navigable all this way?

Senator GOODING. Yes; I understand that, but even so, I understand the water is so low in some places that you can not navigate it all during the dry season.

Colonel BARDEN. Any increase of the low-water flow of the river which would be secured by the construction and operation of reservoirs would be beneficial both to navigation and power.

Senator GOODING. It would increase the power?

Colonel BARDEN. Yes, sir.

Senator GOODING. You do not propose, then, to do this in what you are discussing?

Colonel BARDEN. No, sir.

Senator GOODING. I just wanted to be clear on that.

Colonel BARDEN. At this Dam No. 2 we will have for 83.3 per cent of the time, or about 10 months of each year, 141,000 horsepower; for about 8 months of the year we will have 205,000 horsepower; for about 6 months, 306,500 horsepower; and 600,000 horsepower for about 20 per cent of the time, or about 2½ months.

For Dam No. 3, which is the power dam above this, which is proposed but not now under construction—

Senator McNARY. Before you get to that let me ask you something, Colonel, about this secondary power. To what use do you propose to put the secondary horsepower?

Colonel BARDEN. The secondary power has a certain market value. It is nowhere near that of the primary. What use would be made of this particular secondary power would depend on the policy with reference to the nitrate plant.

Senator McNARY. It would not have any particular commercial use, would it?

Colonel BARDEN. Two of the southern power companies list in their published rates a price for secondary or dump power. That for the Georgia Railway & Power Co., approved by the Railroad Commission of Georgia on September 22, 1920, reads as follows:

"By secondary or dump power is meant the power which the company may be able to deliver in excess of the power required, reserved, sold, or supplied as primary power, and the company reserves to itself the right to shut off or discontinue or to resume the delivery of said secondary power at its option."

The rate is 9.9 mills per kilowatt hour. That is a pretty high rate.

Senator GOODING. What is the primary rate?

Colonel BARDEN. Primary rates run from 14.4 mills down to 6 mills for what is known as the energy charge, in addition to which there is a demand charge based on the amount of power that is used.

The Southern Power Co. has a dump power rate to consumers of 6 mills per kilowatt-hour. I am unable to tell the committee how much power is sold at those rates.

Senator McNARY. I can not see that it would have any particular value outside of the operation of machinery to make ammonium nitrates, and that is limited by the fact that the individual owner or the Government would not want to install a machine that it could operate only sporadically during the year.

Colonel BARDEN. Senator, I think its value is largely for manufacturers and others who have steam plants available, but where they can use the water power for a portion of the year when the power companies can deliver it to them, and for the remainder of the year they run their steam plants, and thereby effect an economy, perhaps, for the entire year.

Senator McNARY. That is an economy in the fuel used?

Colonel BARDEN. Yes, sir.

Senator McNARY. It is contemplated to develop down there a certain quantity of power which will be furnished to cities for lighting purposes, energy for industrial purposes, and during high-water periods for the manufacture of ammonium nitrate, and there is some power that really has not any commercial utility, and lumping it altogether it will have a fair value. I can see, and I wondered if you had worked into that problem sufficiently to say just what use you would make of it.

The CHAIRMAN. Of course, the secondary power, as I understand it, depends a great deal, as far as value is concerned, upon the portion of the year for which it can be used?

Colonel BARDEN. Yes.

The CHAIRMAN. If you have a secondary power that can be used for 10 months, it has much more value than if it can only be used for three months.

Colonel BARDEN. Yes, sir.

The CHAIRMAN. You could afford to use, perhaps, your secondary power that is good for 10 months and maintain a steam plant for the other two to keep it up.

Colonel BARDEN. Yes, sir.

The CHAIRMAN. Whereas if you could only use your secondary power three months, it might be that it would not be possible, as a financial proposition, to maintain your steam plant for the balance of the year?

Colonel BARDEN. Yes, sir; that is correct.

Senator GOODING. But if there is so much power that can be developed you would not want to develop it in a steam plant. Is not that so generally throughout the country, if we are going to talk about the general development of our electric energy?

Colonel BARDEN. I don't know that I quite understand you, Senator.

Senator GOODING. What I mean to say is this: An auxiliary steam plant is not necessary, or won't be in connection with this project when it is completed at all in any sense, will it?

Colonel BARDEN. I think, Senator, if this dam were completed and the power were to be marketed commercially, it would to a certain extent replace steam power which is now in use.

Senator GOODING. Yes; I understand that. The point I am making is that an auxiliary plant would not be in the least economical for this short period of time that it would be required. You had better develop what you can there that will give 100 per cent of power the year around.

Colonel BARDEN. The point I think you are making is what I was going to bring out a little later, that it would not be economical at the present time to put in the entire installation for which the ultimate plans are made.

Senator GOODING. Yes; but lay the foundation for the greater development later.

Colonel BARDEN. Yes, sir. For Dam No. 3 the corresponding figures would be 34,000 primary horsepower; 55,500 horsepower 10 months—that is, secondary horsepower—81,000 secondary horsepower for 8 months; 122,500 secondary horsepower for 6 months; and 250,000 horsepower for about 2½ months. The total primary power at the two dams is, then, 121,300. The steam plants at Gorgas and No. 2 have a combined capacity of 90,000 kilowatts, or approximately 120,000 horsepower. So that if Dams No. 2 and No. 3 were built and both the steam plants now owned by the Government were used, we would have a total of 241,300 primary horsepower.

The CHAIRMAN. Well, now, what proportion of the year would that contemplate using the steam plants? The entire year?

Colonel BARDEN. Oh, no, sir. They would be used probably not to exceed three months of the year. They would have to be in stand-by condition the remainder of the time.

The CHAIRMAN. Without the steam plants at all, what would be the combined primary power?

Colonel BARDEN. One hundred and twenty-one thousand three hundred.

The CHAIRMAN. One hundred and twenty-one thousand three hundred horsepower?

Colonel BARDEN. Yes, sir; and the horsepower of the steam plants is about equal to it.

The CHAIRMAN. Yes. Well, that is including Gorgas?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. I think it would be well, if you can, as you proceed, to give us the figures excluding Gorgas, because that is a possibility that may arise, that we will have to exclude it.

Colonel BARDEN. Yes, sir; I have that for you. The value of the secondary power is naturally much less than that of primary, since it can not be depended upon either as to time or amount. I submit here a table showing somewhat more in detail these figures that I have given you.

(The table referred to is as follows:)

Probable power output, Muscle Shoals, Ala., based on 49-year stream-flow record.

Class of power.	Horse-power.	Kilowatts.	Kilowatt-hours per year.		
			100 per cent.	80 per cent.	60 per cent.
WILSON DAM.					
Primary.....	87,300	65,100	570,289,800	456,215,800	341,161,900
10 to 12 months.....	53,700	40,044	325,092,600	260,074,100	195,055,600

¹ Limit.

Colonel BARDEN. If all the steam power were used in connection with Dam No. 2 to convert secondary power into primary we would have 87,300 plus 120,000, or a total of 207,300 horsepower. Now, if we only used steam plant No. 2, which has a capacity of about 80,000 horsepower, we would have a total primary of 87,300 hydro plus 80,000 steam, or 167,300.

The CHAIRMAN. That is with the steam and Dam No. 2?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. Now, if you would add to that Dam No. 3, what would you have?

Colonel BARDEN. We would have 34,000 more, or a total of 201,300 horsepower.

The installations of hydroelectric machinery are usually made slowly, as the market develops and the load is built up. In this instance it does not appear advisable to install more than about eight units at present, and probably the four units already purchased should be installed and tried out before additional contracts are made. I might say to the committee that four units have already been purchased and are largely completed. Portions of them are already on the ground.

Senator McKINLEY. Is it not a fact that \$1,000,000 out of \$1,300,000 has been already spent?

Colonel BARDEN. Practically that; yes, sir: \$1,000,000 out of \$1,300,000?

Senator McKINLEY. Yes, sir.

Colonel BARDEN. The development of water turbines is progressing rapidly, and it is quite possible that still more powerful and efficient machines would be available in a very few years.

Senator McKINLEY. Would it not be well to bring in there that these four units amount to 120,000 horsepower?

Colonel BARDEN. Yes, sir.

Senator McKINLEY. These four machines?

Colonel BARDEN. These four machines already purchased would develop 120,000 horsepower, which is more than the primary.

Tailrace excavation, draft tubes, and power-house substructure would be completed for the total ultimate installation in all 18 units.

Our estimate of the cost of completing the work on this basis; that is, providing draft tubes, excavation, and power-house substructure for the total number of units, but actually installing at the present time only four units, is \$20,849,000, and putting in eight units, \$23,177,000.

The four units of 120,000 horsepower installation will develop all primary and a small amount of secondary horsepower, and the eight-unit (240,000 horsepower) plan would include the secondary power down to about seven months.

No storage would be provided at either Dam No. 2 or Dam No. 3. The pools can not be drawn down without reducing the depth required for navigation nor could they be raised without large additional costs for damages to overflowed lands.

Senator McNABY. What pool do you refer to?

Colonel BARDEN. The pools formed by this Dam No. 2 and Dam No. 3.

It is probable that this will also be true of any additional dams built in the main river for navigation and power.

The district engineer at Chattanooga, however, who is making a comprehensive survey of the Tennessee River and tributaries, states that on these tributaries above the Muscle Shoals section 46 combined reservoir and power dams are believed to be feasible, each having a draw-down capacity varying from 5,000 to 800,000 acre-feet.

Senator McKINLEY. Those are the ones up here [pointing to a map], are they?

Colonel BARDEN. I don't know whether they are exactly the same ones or not, Senator, but they are approximately the same.

The CHAIRMAN. The figures that the Colonel is giving now are from the Government engineers. The dams illustrated on this map come from the Tennessee River Improvement Association, so they are from different sources, although they cover the same territory to a great extent.

Colonel BARDEN. Yes; and I presume they are practically the same. Major Fiske tells me that his report is not yet ready for submission, and this is merely preliminary information he is giving now. He says there are 46 combined reservoir and power dam sites available, each having a draw-down capacity varying from 5,000 to 800,000 acre-feet. The two largest, with capacities of 700,000 and 800,000 acre-feet, respectively, are located on the Clinch

River, and he thinks that if their draw down were properly regulated in the interest of the Muscle Shoals dams the minimum flow and therefore the primary power would be about doubled for an average year.

The CHAIRMAN. That is, with those two?

Colonel BARDEN. With those two reservoirs, which are the two largest.

The CHAIRMAN. Has he given an estimate of the cost?

Colonel BARDEN. No, sir. He goes on to say that he believes that those will be feasible, both from a construction standpoint and a financial standpoint, but he has not the complete information available as yet.

The CHAIRMAN. Are they both on the Clinch River, Colonel?

Colonel BARDEN. Yes, sir; both of those.

The CHAIRMAN. How far apart? Do you know?

Colonel BARDEN. No, sir.

The CHAIRMAN. Can you point that out on the map, Mr. Williams?

Mr. WILLIAMS. One, I believe, is here [indicating], and the other is down in here somewhere.

The CHAIRMAN. Above the conjunction with that other river?

Mr. WILLIAMS. Yes, sir. They are both very high dams.

Senator McNARY. What is the combined acre-feet?

Colonel BARDEN. A million and a half.

The CHAIRMAN. You say that, if properly operated, these two dams would double the primary power at Muscle Shoals?

Colonel BARDEN. In what he calls an average year.

Senator GOODING. Have you any record for any length of time of the flow of these rivers that he speaks of, where these reservoirs are mentioned?

Colonel BARDEN. I don't know about that.

Senator GOODING. You don't know whether they have a gauge record that has been kept in the South or not, by the Government?

Colonel BARDEN. Yes, sir. We have a 50-year record at Florence.

Senator GOODING. You don't know how far up the river they extend?

Colonel BARDEN. I presume they have the records up there that extend over a large number of years.

The CHAIRMAN. Have you ever been up to the proposed site of these two dams?

Colonel BARDEN. No, sir. I can not give any information about it.

The CHAIRMAN. Do you know what kind of country it is, so that we can get some idea about the damages that you are speaking of now?

Colonel BARDEN. No, sir; I can not give any information.

Senator GOODING. It would be very large if it was settled country.

The CHAIRMAN. Yes. That is what I am trying to find out. It is evidently in the mountains, is it not?

Colonel BARDEN. Yes, sir; it is in the mountains.

Senator HEFLIN. But, Mr. Chairman, it is like Muscle Shoals. You will remember, those who visited Muscle Shoals, that the hills are high on either side of the river. The water will never get more than half way up those hills. There is very little bottom land to be overflowed. There is a row of hills on the east side and west side of the river.

Senator McNARY. Has any investigation been made as to whether they will hold the water?

Senator HEFLIN. What is that?

Senator McNARY. By the impounding of it. Is it tight all around, so that water will not seep through the crevices?

Colonel BARDEN. I think no detailed examination has been made.

Senator McNARY. That is a very important matter. In the various impounding schemes of water in the West they find that not more than half of the reservoir sites will hold the water. That is due to the structure of the mountains, of course. If you have low land you very likely would have a better reservoir that if you had to depend upon the rough sides of the hills.

Senator McKINLEY. Colonel, just a question to clear up a point in my mind. You say there are two pools formed, one 800,000 and the other 700,000 acre-feet, both on the same river. Does that mean that one would empty into the other and it would be the same water?

Colonel BARDEN. Yes, sir.

Senator McKINLEY. Well, then, how would you get the benefit of it down at Muscle Shoals if it is the same water?

Colonel BARDEN. If both reservoirs are full at the beginning of the low-water season, you have the total amount of water available.

Senator GOODING. They take the peak off of the floods, you know. That is the purpose of a reservoir, to hold back the water. It not only controls the flood but increases the water supply at low-water stages.

The CHAIRMAN. The operation of these reservoirs, as I understand it, if they work successfully, would be to increase the flow over the Dams Nos. 2 and 3 at Muscle Shoals in low water and to decrease the flow in high water?

Colonel BARDEN. Yes, sir.

Senator GOODING. You have not any definite information in regard to those reservoirs?

Colonel BARDEN. No, sir.

The CHAIRMAN. Of course, whether that could be done would depend, first, upon whether, as Senator McNary says, it would hold water. If those hills will not hold water, there is no use fooling with it. Second, it would depend upon the cost.

Colonel BARDEN. No detailed field examination has been made, as I understand it. This is just preliminary reconnaissance.

The CHAIRMAN. Is this officer that you speak of making a detailed examination?

Colonel BARDEN. I don't think he has money to make borings and detailed plans. I am not fully advised as to that point, but that is my information.

The CHAIRMAN. All right.

Colonel BARDEN. There will be available a certain amount of what is known as pondage or daily storage which can be used at Dam No. 2 without interfering with navigation. This can not be used to increase the primary power. It has no influence on the primary power, because at times of low water the entire amount of water flowing in the river must be allowed to pass continuously in order not to interfere with the navigable depth below. But, at all stages above the lowest, this method can be used and will decrease the amount of steam power required to convert the hydro power into primary.

We would like to emphasize the fact that our estimates of cost have been made on a liberal basis with a view to covering all sorts of contingencies, while those submitted by others are believed to be very close, with probably inadequate allowances for contingencies, such as are always likely to occur in works in river beds.

Our figures could probably be reduced as prices now stand, but the work on No. 2 would extend over a period of three years, and that on No. 3 another three years, or a total of six years, since the economical construction of No. 3 would depend upon the use of the same construction plant that is now used for the construction of No. 2.

The CHAIRMAN. It would not be economical, then, as I understand you, to commence construction of No. 3 until you have completed Dam No. 2?

Colonel BARDEN. That is our idea; yes, sir.

Senator HEFLIN. What do you mean by six years?

Colonel BARDEN. I mean our estimates are that it will take three years for the completion of Dam No. 2, and that it will take a similar length of time for the completion of Dam No. 3, and that the most economical way to construct Dam No. 3 would be to wait until the construction plant which we now have at No. 2 and which was very expensive and which would be equally suitable for Dam No. 3, is available.

Senator HEFLIN. Then you mean that both will be completed in six years?

Colonel BARDEN. Yes sir. That would be our idea.

Senator HEFLIN. Could both of them be built at once and be completed in three years?

Colonel BARDEN. If you started on Dam No. 3 at the same time we start the completion of Dam No. 2, they could be.

Senator NORBECK. You mean the work will be more economical if you use the same machinery and equipment used in the construction of Dam No. 2 for constructing Dam No. 3?

Colonel BARDEN. Yes sir.

Senator GOODING. Is the country ready for all this additional power? It would take some time to develop that, so that it would be economy to go on and build one dam at a time?

Colonel BARDEN. It certainly would if the power was to be used for commercial purposes.

Senator GOODING. The country would develop sufficiently to take care of it all in a year or two or three years, possibly.

Colonel BARDEN. Oh, no, sir. It would take more time.

Senator GOODING. To develop the country?

Colonel BARDEN. To develop the country to use all of the power.

Senator GOODING. It is an immense amount of power, and it is economical always to complete one thing first?

Colonel BARDEN. Yes.

I think perhaps I might say why we considered it would take three years to complete Dam No. 2. This period is determined by the methods employed for the stream control. In other words, certain parts of the work have to be done during low-water periods. We have now two channels in which no work has been done other than the construction of a bridge across it, shown by this diagram. This upper portion of the drawing represents the dam as it will be when completed [pointing]. This is the top of the pool or the elevation of the pool right along here. This is the lock end and this is the power-house end. This is the central part of the River, Jacksons Island, on which most of the work has been done. On the north side of the river a cofferdam was constructed extending about 650 feet into the river, and in that cofferdam excavations have been made and concrete placed to the extent shown in yellow.

On Jacksons Island a short cofferdam was built on each side of it, inclosing a total distance of 1,250 feet, and in all of that section the excavation has been completed and concrete is placed to the extent shown.

Similarly, at the power house end we have a cofferdam about 832 feet out into the river, inclosing some 12 acres, in which a considerable amount of excavation—something over 130,000 yards of rock—has already been accomplished, and a limited amount of concrete placed. The cofferdam in which this work on the north shore was constructed has been removed, as well as the cofferdams at the two sides of Jacksons Island, the work therein having been completed to a point that would permit their removal, and the flow of the river is through openings which have been left in the concrete. These openings will remain until the final step of closing the dam. The next step in the work should be done this low-water season if we have the funds available, and it would be to close off this north channel of the river, in which no work has been done as yet; put a cofferdam across that, excavate the rock, and bring the concrete up to the same stage as shown here, 7 feet above the original river bed, with 12-foot piers carried up as far as convenient. Then that cofferdam will be removed before the next high-water season, and the river will then be flowing through all these openings and through the unobstructed south channel.

At the next low-water season we would similarly cofferdam off the south channel, make the excavation, and bring the concrete to this same stage, at which time we would have 42 openings, alternately 30 and 38 feet wide, through which the river will be flowing. The river bed elevation will have been raised 7 feet. That cofferdam will have to be taken out at the end of the second low-water season.

Then, in the third low-water season we will proceed to fill in these openings, raising the pool gradually. We would bulkhead off four or five openings at a time, and put in perhaps 5 or 6 feet of concrete, and continue that all the way across the river, by which we will have raised the pool about 5 or 6 feet. That process will be continued until the dam is carried up to the full height.

That method, you see, will take three low-water seasons, and would carry the completion of the dam into the winter of 1924 and 1925, and that will also require—

The CHAIRMAN (interposing). Colonel, before you leave your map there—I don't know whether the committee all understand it or not—but explain to them from that map that at the top, above the yellow, above the concrete when it is finished, the river will run through concrete openings there, and on the top, then, still higher, will be a bridge?

Colonel BARDEN. Yes, sir. This line represents the top of the concrete. Up about here, or 18 feet above, will be the top of the gates which operate between these piers which carry the roadway across from the north bank to the south bank, on this concrete arch bridge. Between these piers are gates 18 feet high and 38 feet wide, which maintain the pool elevation at a fixed height. When the river rises to such a point that there is more water flowing than will go through the wheels of the power house, those gates will be raised, one by one, as may be necessary, to prevent the water from rising above the fixed pool elevation, and therefore flooding more land than has been acquired.

Senator HEFLIN. When you get that bridge completed, Jackson Highway or Lee Highway will cross the river at that point, will it not?

Colonel BARDEN. Yes, sir. That is a highway bridge.

The CHAIRMAN. Is Dam No. 3 to be equipped similarly?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. The same kind of dam exactly?

Colonel BARDEN. Yes, sir. Dam No. 3 will be similar in all essentials to this dam. It is a lower dam, having a lift of about 40 feet as compared with 97 feet here, and is longer, about 6,700 feet, as against 4,500 feet for this one. Of course, the amount of power developed will be proportionately less—a little over 40 per cent of what will be developed here.

Senator HARRISON. How will its cost compare with this one?

Colonel BARDEN. Our estimate of the cost of building Dam No. 3 is \$25,000,000.

The CHAIRMAN. Dam No. 2, when completed, will have cost how much?

Colonel BARDEN. About \$45,500,000, with the entire 18 units.

The CHAIRMAN. Yes. Well, say equipped with eight units?

Colonel BARDEN. Equipped with eight units, it would be about \$40,300,000.

Senator HEFLIN. Dam No. 3 will not cost but little more than half what the Wilson Dam will cost?

Colonel BARDEN. That is right. But little less than half of the power will be developed there also.

The committee, of course, will understand that as the work now stands navigation is permanently blocked. What channel was available there before has been entirely blocked by this heavy mass of concrete which is shown here [indicating]. The channel is on the north bank of the river.

Senator HEFLIN. That is where the boats passed?

Colonel BARDEN. That is where the boats passed.

Senator HARRISON. And it has been blocked since about when—1916?

Colonel BARDEN. No, sir. About the winter of 1918-19.

Senator McKINLEY. But, Colonel, there is a space between that dam and that bank over there.

Colonel BARDEN. In there? No, sir.

Senator McKINLEY. No; on the other side of the river.

Colonel BARDEN. No, sir.

Senator McKINLEY. Does that concrete go right up against the side of it?

Colonel BARDEN. What you are thinking of is that little narrow opening, perhaps.

The CHAIRMAN. I think the Senator is thinking of the excavation that is made there for the locks.

Senator McKINLEY. I am thinking that it is not impossible for them to carry that water way around. You can get around that block of concrete.

Colonel BARDEN. This is the only practical place here [indicating].

The CHAIRMAN. The Senator, I think, Colonel, was thinking of the space there where the locks are partially excavated.

Colonel BARDEN. Yes; but that is up 75 feet above the river.

The CHAIRMAN. Yes; I think so. I think he is mistaken about it; but that is what he is thinking about, I think.

Senator GOODING. Well, Colonel, is this work here going to develop a cheap power as compared to other great plants that are developed in the country? How does it range in that respect? Is that construction cheap?

Colonel BARDEN. I don't think that it is as cheap as has been represented in some public statements.

Senator GOODING. Do you know how it compares with the Niagara development or the development on the Mississippi at the Keokuk Dam?

Colonel BARDEN. I will give what I have on that, and it must be taken for what it is worth.

Senator McKINLEY. In the figures you are going to give do you figure anything for interest?

Colonel BARDEN. I will explain, Senator, just what I have done, and, as I say, you can assign just as much weight to this as your judgment indicates you should.

I have done this: I have assumed that we will complete this Dam No. 2, with eight units, at a cost of about \$23,177,000, and we will take 9 per cent on that figure as the annual cost, 4 per cent of that being for interest and 5 per cent for the cost of operation, depreciation, and obsolescence.

Senator McKINLEY. It makes no allowance for the other \$17,000,000?

Colonel BARDEN. Making no allowance in this figure for the other \$17,000,000.

The CHAIRMAN. In other words, now, so you will get it right on the record,

you are going on the theory that we make no charge whatever for what has been expended in the past, but we start now and complete that dam?

Colonel BARDEN. We start now and assume we will complete it for eight units at a cost of \$23,177,000.

The CHAIRMAN. That is making no calculation on past expenditures?

Colonel BARDEN. Making no calculation on past expenditures, and that we have got to get 9 per cent on that per annum, which will be \$2,086,000.

Senator McKINLEY. How much?

Colonel BARDEN. \$2,086,000 per year.

Now, I also assume that we will run the steam plant at No. 2 to convert as much of the secondary power of this dam into primary as can be done by the operation of that plant.

Senator GOODING. Is that the practice in all great hydroelectric plants, to have the steam power to build up the secondary power?

Colonel BARDEN. I think it is.

Senator GOODING. You think it is?

Colonel BARDEN. Yes, sir.

Senator GOODING. I did not know.

Colonel BARDEN. Except in the case of the Niagara plants, where you have a constant flow of the river, but in ordinary streams that is usual.

Senator GOODING. Does that mean cheap power, though, where you have a duplication of plants?

Colonel BARDEN. It is cheaper than steam power alone.

Senator GOODING. It is cheaper than steam power alone, but that is not the ideal power after all. It is not cheap power after all?

Colonel BARDEN. It is the cheapest that is available, I think, Senator.

Senator GOODING. I am thinking of cheap power.

Senator McKINLEY. It is commercial power?

Colonel BARDEN. It is commercially practical.

Senator McNARY. What do your figures show?

Colonel BARDEN. Our estimate for the operation of the steam plant, Senator, is on the basis of \$15,000 for labor per month, \$172,800 for coal, \$12,200 for miscellaneous supplies, making a total of \$200,000 per month. Now, that will have to be run for probably three months, so I have assumed that we will have for three months' labor at \$15,000, \$45,000, and \$30,000 labor for the remaining 9 months, because some part of the force will have to be kept there the year around; that the coal will be \$500,000, and miscellaneous supplies \$25,000, or a total of \$600,000 for the operation of that steam plant for the portion of the year that is required. Then we must take 4 per cent interest on the value of the steam plant, which I placed at \$9,000,000, and another 4 per cent for depreciation and obsolescence, making a total for the steam plant per annum of \$1,320,000.

Senator McKINLEY. A commercial company would charge 14 per cent?

Colonel BARDEN. As I say, I give these figures for what they are worth.

Senator McKINLEY. Yes.

Colonel BARDEN. That would make the total charge per year, \$3,406,000. Now, if we took our primary horsepower as 87,300 and add to it the 80,000 horsepower that we get from the steam plant, we have a total primary power in that way of 167,300 horsepower, which will cost \$20.30 per year.

The CHAIRMAN. Per horsepower?

Colonel BARDEN. Per horsepower per year; yes, sir.

Senator GOODING. What is that figure?

Colonel BARDEN. \$20.30 per horsepower per year.

Senator McNARY. Have you reduced that to kilowatt hours?

Colonel BARDEN. Yes, sir. That price includes the secondary. All your secondary that you get beyond that is free.

We have an installation here of 8 units, which provides for a total of 240,000 horsepower, and I am only using here 167,300 of it, so that whatever secondary power there is over that goes in for nothing on that basis.

Senator McKINLEY. Well, that horsepower, in the normal way of using it, would be about 40 per cent efficiency, which would cost you something like 10 mills, wouldn't it?

Colonel BARDEN. At 80 per cent load factor it would be about 3.88 mills, and at 60 per cent it would be 5.18 mills per kilowatt hour.

Senator McNARY. How much is that per kilowatt hour?

Colonel BARDEN. 5.18 mills per kilowatt hour on a 60 per cent load factor.

Senator GOODING. What is the commercial price, generally, per kilowatt hour? It varies, of course.

Senator HARRELD. Whatever they can get.

Senator GOODING. I know, but there is an average figure. I wanted to get the average.

Colonel BARDEN. The Chief of Engineers, in his testimony before the House committee, said that the Southern power companies told him that they got an average of 9 mills per kilowatt hour.

Senator HARRELD. How much per horsepower?

Colonel BARDEN. Per year?

Senator HARRELD. Yes.

Colonel BARDEN. About \$51.

Senator MCKINLEY. What load factor are you taking?

Colonel BARDEN. Sixty.

Senator MCKINLEY. Is that about the heaviest?

Colonel BARDEN. It depends on the use you make of it, of course. The manager of the Tennessee Copper Co., which has a plant in east Tennessee, told me that several years ago he made a contract with the Tennessee Power Co. for \$25 per horsepower per year, and then during the war, when prices went up, the company wanted to raise the price, and he agreed to pay them \$40; but that now they wanted to raise it to, I think, \$60, and he was demurring at that. That is an indication of what is paid in that locality.

Senator HARRELD. In other words, they get whatever they can get.

Colonel BARDEN. Yes, sir.

Senator HARRELD. Whatever the people will stand for.

Colonel BARDEN. We use a small amount of power at the dam, which we buy from the Alabama Power Co., and our price is about a cent and a half per kilowatt hour.

Senator HARRELD. Let me ask you this question. Is it not true that there is more demand for power that is certain than the present plants can supply in that section?

Colonel BARDEN. I would not like to answer that.

Senator HARRELD. What I am trying to get at is what market there is for that power there at this time?

Colonel BARDEN. I have this paragraph about the market, Senator, to answer your question.

The total kilowatt hours available from this eight-unit installation would be 1,315,962,800. The letter from the Tennessee and Georgia power companies to the Chief of Engineers quoted in the testimony of the latter before the House committee, stated that the demand for power in the southeastern territory would absorb 500,000,000 kilowatt hours, or a little less than half of it, by 1927. During the war General Keller examined the power situation in the South and elsewhere, and his report, which was published afterwards, estimated that 1,000,000,000 kilowatt hours would be needed in the southern territory in from five to seven years. So that I think those two investigations—

Senator MCKINLEY. In five to seven years?

Colonel BARDEN. Yes, sir. One of these estimates says they can use about 500,000,000 kilowatt hours by 1927, and the other investigators think they can use a billion in the next five to seven years.

The CHAIRMAN. Colonel, I wanted to ask you something about the load factor.

Senator HARRELD. Before you get away from that, let me ask you this:

Have you any statistics showing what the percentage of the primary and secondary power of these various hydroelectric plants that have been constructed in the past has been? That is, whether 60 per cent of the power or 50 per cent or 75 per cent of their available power is primary?

Colonel BARDEN. I think all of these southern power companies are disposing of all their available power, and are increasing their power. The Alabama Power Co. is building a new dam now on the Coosa River, just below their present dam, at which the ultimate installation will be 120,000 horsepower, and I think the Georgia power companies are increasing their capacities, and, if I am not mistaken, the Carolina power companies also are increasing their installations. In other words, there is a market for all the power that is now available.

Senator NORRECK. I understand that while there is a market for all the power available, still the load factor may be only 30 to 40 per cent. While there is a market for all of it, there is likely some to go to waste anyhow.

Colonel BARDEN. The average load factor of the South is about 50.

Senator NORBECK. So that when you speak of all the power available having a market, only about half of it is being used?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. Taking up that matter which I started to inquire about when I was interrupted, does not that depend upon the business that they are using it for?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. For instance, if you were operating a street railway you would have an entirely different load factor than if you were using it for something that consumed the same amount of power 24 hours of the day?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. Assuming that we are going to use this plant, instead of selling the power to anybody, we are going to make fertilizer out of it, would not the load factor be the same all the time?

Colonel BARDEN. It would be 100 per cent.

The CHAIRMAN. Could we not use there, in making fertilizer, the entire amount of power that would be generated?

Colonel BARDEN. Well, the present nitrate plant requires for operation at full capacity only 110,000 horsepower.

The CHAIRMAN. Yes.

Colonel BARDEN. So that that amount of power could be used continuously.

The CHAIRMAN. That is, not counting the other plant.

Colonel BARDEN. No, sir.

The CHAIRMAN. That is at the cyanamid plant. Now, if that other plant is developed and improved so that it can operate to its capacity, how much power will that take?

Colonel BARDEN. That takes just a small amount of power, Senator, and they have their own plant.

The CHAIRMAN. They have a steam plant?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. It will be cheaper to operate by water power?

Colonel BARDEN. I think that is about 5,000 kilowatts.

The CHAIRMAN. The cyanamid plant would require a small amount of power?

Colonel BARDEN. I think it is 5,000 kilowatts.

The CHAIRMAN. Then, after all, we would have developed more power than it would take to operate the Government plants there?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. So that the load factor would cut some considerable figure?

Colonel BARDEN. Yes, sir.

Senator HEFLIN. This power produced by water is much cheaper than that produced by steam. That is a correct understanding?

Colonel BARDEN. Yes.

The CHAIRMAN. Colonel, let me ask you about this quarry we have over there from which we get the limestone that is necessary. I think that is about 1,200 tons a day, if they operate this cyanamid plant to its capacity, isn't it? How is that operated? What power is used for that?

Colonel BARDEN. It is connected now with the line from Gorgas, of the Alabama Power Co.

The CHAIRMAN. Has it any connection with this other plant?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. They could operate there by electric power?

Colonel BARDEN. Yes, sir. That is right.

The CHAIRMAN. How much power will that take? Is it quite an item?

Colonel BARDEN. I don't know.

Major BURNS. I have not got the figures, but it is rather a small quantity.

The CHAIRMAN. Would it be a practical proposition to fix these railroads that the Government owns so that they will operate and have to continue to operate a great many of them in connection with the cyanamid plant—would it be practical to operate them by electricity and do away with the steam engines and work those from the water power?

Colonel BARDEN. I think I would rather you would ask Major Burns that question.

The CHAIRMAN. All right; we will ask him later.

Colonel BARDEN. There will be none of that required in the operation of the dam, at least.

The CHAIRMAN. You are not a chemist?

Colonel BARDEN. No, sir.

The CHAIRMAN. I understand they will have to bring in a great deal of rock. My recollection is 1,200 tons a day will be required to operate that cyanamid plant.

Colonel BARDEN. I understand that is brought over a commercial railroad.

The CHAIRMAN. Yes; is that true?

Major BURNS. That is correct; yes, sir.

Senator HEFLIN. Is that phosphate rock?

Colonel BARDEN. No, sir; he is speaking of the rock from the Waco quarry.

Senator HARRELD. You mean rock that is now used there for making cyanamid?

Colonel BARDEN. Yes, sir.

I was speaking of our estimates of costs and saying that I believed they were very conservative, and that we believe in view of the experience already had in the conduct of this work and studies made and plans prepared for its continuance, that it could be completed by this office at substantially as low a figure as by any other agency. The only material saving that could probably be made by a private concern would possibly be by paying perhaps not quite so good wages as we do, and possibly by not adhering to the 8-hour law, but it is a question as to whether this latter would not be required if the money for the work were being furnished by the Government.

It is hoped that the recommendation of this committee for an appropriation for immediately resuming construction work on Dam No. 2 may be adopted by Congress.

Construction plants and particularly cofferdams and temporary buildings of all kinds depreciate at the rate of approximately \$400,000 per year. Unless some action is taken very soon a full working season will be lost and completion of the dam postponed at least a year. Such an appropriation need not interfere with nor prevent the acceptance of any offers now under consideration or that may be subsequently made. They can be readily amended to meet the conditions existing at the time of acceptance.

The amount recommended will be sufficient for a year's operation.

Senator HARRELD. What would be, in your opinion, the latest date on which this appropriation could be made available for this year's use?

Colonel BARDEN. Well, sir, if it were made available on the 1st of July, we have a small balance which would be sufficient to permit us to start our preliminary work.

Senator HARRELD. Of course, you have enough there to do the preliminary work, to go ahead and do preliminary work leading up to the regular work?

Colonel BARDEN. Yes, sir.

Senator HARRELD. And you have to know whether the balance will be available by a certain time in order to get ready for this season's work. Now, what is the latest possible time that you think this work could be started? In other words, how soon do you think this bill ought to be passed to get the best of this season's work?

Colonel BARDEN. I think if we knew within 30 days that the bill were going to be passed we could go ahead and be able to take full advantage of the season.

Senator HARRELD. You think it is advisable that the War Department be informed in 30 days whether or not the work will proceed?

Colonel BARDEN. That would be very desirable; yes, sir. It is possible that the 1st of June would be soon enough.

The CHAIRMAN. What you mean is, as I understand it, that 30 days after you know work is going to proceed you could be working? Is that your idea?

Colonel BARDEN. No, sir; that is not the idea.

The CHAIRMAN. That is not the idea?

Colonel BARDEN. Yes, sir. It is that if we know by the middle of May or by the 1st of June, possibly, that we will have funds available on the 1st of July we have enough balance now in hand that would permit us to start work.

Senator HARRELD. But you would not want to start unless you knew that the appropriation would be made?

Colonel BARDEN. That is correct. If we knew by the middle of May or the 1st of June that we were going to have the money by the 1st of July, then I think we could take full advantage of this coming low-water season.

Senator KEYES. The only way to know is by the passage of the act.

Colonel BARDEN. That is the only way; yes, sir.

Senator HEFLIN. In other words, if you knew you were going to have this money, you would go ahead with your preliminary arrangements and be ready to go ahead with the regular work on the 1st of July?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. Now, Colonel, right along that line I want to ask you a few questions about the plant. I mean the railroad and bridge and the mixing plants and the engines and the cars, and everything. If the Government were to quit work and individuals were to take it up, they would either have to buy out the Government in getting the plant or duplicate it, practically, in order to do any work, wouldn't they?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. Then, as a matter of fact, the Government is situated, is it not, having all this plant there so that it can do this work on Dam No. 2 cheaper than anybody else could possibly do it, even though they paid less wages and worked longer hours?

Colonel BARDEN. Unless the plant were turned over to them without any charge.

The CHAIRMAN. I understand, unless the Government gave them the plant.

Colonel BARDEN. Yes, sir.

The CHAIRMAN. And it would take, if we had no plant there or if this were destroyed and taken out and somebody started now to fix up a plant, a year or so to get ready to do any work, would it not?

Colonel BARDEN. Yes, sir; fully that.

The CHAIRMAN. So that, no matter who does it, if not done by the Government, in order to get any expedition or any economy they would have to have the Government's working plant?

Colonel BARDEN. Yes, sir. I think that all the offers already before Congress contemplate that all the Government's plant and property should be turned over.

The CHAIRMAN. Yes; I think so. Otherwise they would be a year or so getting ready for work.

Senator MCKINLEY. Perhaps you will have to get some figures later to put in the record, if it is agreeable to the chairman, but I understand you to say that, figuring on the basis of 4 per cent interest and 5 per cent depreciation and obsolescence, you figure that you can count on about 240,000 primary power—that is, backed up by steam—at \$20 per year per horsepower. Is that right?

Colonel BARDEN. About 167,300 horsepower, at \$20.30.

Senator MCKINLEY. Now, I think, if it is agreeable to the chairman, you can put that in the record and figure it out, as I have just figured it here. I figure that that, on an 80 per cent load factor, would amount to about 2½ mills per horsepower.

The CHAIRMAN. Per kilowatt hour, you mean, don't you, Senator?

Senator MCKINLEY. No, sir; I mean per horsepower.

The CHAIRMAN. Two and a half mills?

Senator MCKINLEY. Yes, sir.

The CHAIRMAN. Oh, I understand; yes.

Senator MCKINLEY. I just asked that he figure it out before he puts it in and then have it printed in the record. That gives us a better idea of what we are figuring on.

The CHAIRMAN. Yes.

Colonel BARDEN. I will put that in, but our figure is a little more than that.

Senator MCKINLEY. Well, you can figure it. I might say this: That we have a cement mill on one of our powers on the Illinois River, and they paid us last year on the basis of—they paid us \$150 for power, and that was pretty near 24-hour power; 80 per cent, anyhow. They paid us 8 mills for grinding cement per kilowatt hour, though. That would be about 6 mills per horsepower hour.

Colonel BARDEN. There is another way of looking at this.

Senator MCKINLEY. You can figure it out a little later.

The CHAIRMAN. Yes; and put the figures in the record.

NOTE.—The figure is 2.9 mills per horsepower hour.

Colonel BARDEN. Here is another matter that I may take up now. If we assume that the available power at dam No. 2, the primary power, be sold on a 60 per cent load factor for 3 mills per kilowatt hour, the yearly return would be \$1,023,486. If the secondary power, amounting to 447,415,800 kilowatts, should be sold for 1.16 mills—

Senator MCKINLEY. How long is that secondary power for?

Colonel BARDEN. Seven months.

Senator MCKINLEY. Can you keep an organization together and run seven months?

Colonel BARDEN. I was just making this assumption.

Senator McKINLEY. I know, but you get a lot of wild figures in there, you know, and they fool the people.

Colonel BARDEN. Well, in the testimony before the House committee they have used even wilder figures than I am using. Mine are more conservative than anything that has been presented up to date, I imagine. As I say, I am giving these figures for what they are worth.

If you assume that the secondary power can be sold for 1.16 mills, we will have a return of \$519,014 from the secondary power, or a total return of \$1,542,500, which is approximately 7 per cent on the amount of money required to complete the plant. I was just giving this to the committee as showing some of the possibilities from what would seem to me to be a reasonably conservative viewpoint, if the Government sold the power. The Alabama Power Co., in its offer, if you will recollect, agreed to give the first 100,000 secondary horsepower free, and said that that was estimated to be worth \$7.53 per horsepower per year, or 1.16 mills per kilowatt hour.

Senator McKINLEY. They proposed to take out only 100,000 horsepower.

Colonel BARDEN. Their proposal is to give to the Government or to anyone whom the Government indicates, 100,000 secondary, the first 100,000 secondary horsepower. I think their offer does not say how much they are going to consider as primary, so I don't know how much they would take out as primary. Is that your question?

Senator McKINLEY. I was under the impression that they said about 100,000 primary.

Colonel BARDEN. I think their offer was indefinite on that point.

Senator HARRELD. The primary power is a matter of calculation, is it not?

Colonel BARDEN. It is more or less a matter of arbitrary determination, Senator. The absolute primary is fixed, but commercially it is more or less arbitrarily determined.

Senator NORBECK. The secondary power might be that power which was available only 30 days a year, and then, under certain conditions.

Colonel BARDEN. Yes, sir.

Senator McKINLEY. Your estimate is that with the steam plant that is there, there is 167,300 primary power?

Colonel BARDEN. With the steam plant; yes.

Senator HEFLIN. That is available all the year?

Colonel BARDEN. That would be available all the year.

The CHAIRMAN. That is what makes primary power?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. That is the definition of it, but the secondary power may be very valuable or practically worthless, depending on what proportion of the year it could be used as power.

Colonel BARDEN. And what particular purpose it could be used for.

The CHAIRMAN. Yes. As Senator Norbeck has said, if the secondary power lasted only 30 days in the year it would not amount to much.

Colonel BARDEN. No, sir; not for any purpose.

The CHAIRMAN. If that same power lasted 11 months in the year it would be very valuable?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. So that you have there the two extremes, and it could be anywhere between the two?

Senator HEFLIN. Do industrial plants use primary power principally, or do they use secondary?

Colonel BARDEN. Primary, ordinarily.

The CHAIRMAN. They convert secondary power into primary power by the use of auxiliary steam plants, do they not?

Colonel BARDEN. Very often; yes.

The CHAIRMAN. Now, Colonel, I have so often said, and I wonder if it is right, that the weakness of this whole proposition, in fact, the weakest point in it all, is the great difference between the maximum and the minimum flow of the Tennessee River?

Colonel BARDEN. No, sir. I think the weakest point in this proposition is the width of the river.

The CHAIRMAN. That is, it makes it too expensive to build a dam?

Colonel BARDEN. It makes it so expensive to build a dam. If it had not been for that the power would probably have been developed many years ago.

The CHAIRMAN. I can see how that is a weakness, but there is a tremendous difference between the maximum and the minimum flow of the river.

Colonel BARDEN. Not more than for most of the streams of the country.

The CHAIRMAN. Is it not more than most of the northern streams, for instance?

Colonel BARDEN. Not more than the southern streams.

The CHAIRMAN. Perhaps it compares favorably with the southern streams, but they flow by quicker than the northern streams anyway, don't they, because they get no part of their supply from snow, and that in itself, in some parts of the country, performs the service of a reservoir.

Colonel BARDEN. Of course, the Niagara and St. Lawrence Rivers are in a class by themselves.

The CHAIRMAN. Yes; I think so. That is steady and constant all the time.

Colonel BARDEN. That is the ideal situation. I am not sufficiently familiar with the power development on other northern streams to say whether the variation between extreme low water and flood water differs greatly from those of the southern rivers, but I don't think there is a great deal of difference.

The CHAIRMAN. In Dam No. 2 you have a flow of the river that comes down so you get a minimum power of 87,300, and you have figured it up, and never got through figuring, and it runs up as high as 1,106,000. It is claimed by others that it goes as high as 3,000,000.

Colonel BARDEN. I may answer that in another way. The minimum flow for 87,300 horsepower is 10,000 cubic feet a second. Now, our maximum flood record is about 440,000.

The CHAIRMAN. I guess we will have to quit now. We will adjourn until 10.30 to-morrow.

(Whereupon, at 12 o'clock noon, the hearing was adjourned to 10.30 o'clock a. m., Wednesday, April 12, 1922.)

MUSCLE SHOALS.

WEDNESDAY, APRIL 12, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building. Senator George W. Norris presiding.

Present: Senators Norris (chairman), McNary, Ladd, Harrison, and Heflin.

The CHAIRMAN. The committee will come to order, and Colonel Barden will proceed.

STATEMENT OF W. J. BARDEN, COLONEL, UNITED STATES ARMY— Resumed.

Colonel BARDEN. Senator, I have very little more to add unless the committee want to ask further questions.

I referred in the first part of my testimony briefly to what might be called the value to navigation of this project, and the fact that in 1916 the Engineer Department, as set forth in House Document 1262, Sixty-fourth Congress, first session, was, in general, favorable to entering into an arrangement with the Muscle Shoals Hydroelectric Power Co., by which "this serious obstruction to navigation on the Tennessee River will be overcome, and at the same time one of the great natural resources of the country will be conserved," the net cost chargeable to the United States being \$8,573,000, though provisions for payment for horsepower would have ultimately still further reduced that amount.

As I explained, this recommendation had been made by the Board of Engineers that investigated this matter, or, rather, by the Engineer officer who investigated it for the Board of Engineers for Rivers and Harbors, but the latter board, in view of the fact that this national defense act, which contained the provision for \$20,000,000 for the nitrate plant, was pending, recommended that action on this particular proposition be withheld until it was determined what was to be done about this nitrate question.

The "value to navigation" of such a combined scheme for power and navigation is a somewhat indefinite term. Assuming these two dams to be built for the development of power only, the cost of providing for navigation would be merely the excess cost of putting in locks over that of a solid section of dam across the upper end of the lock and into the abutment. The approximate cost of this would be \$2,860,000 for Dam No. 2, and \$4,125,000 for Dam No. 3, or \$4,285,000 for both dams.

The pool formed by Dam No. 2 extends some 15 miles upstream, and that formed by the proposed Dam No. 3, on account of the flatter slope of the river above, would be over four times as long. The two dams together will provide 6-foot navigation from the site of Dam No. 2 to Flint River, a distance of approximately 80 miles.

The cheapest way in which navigation could be provided over this stretch of river would be by (a) dredging and the construction of low dams or dikes in the river above the upper section of the present Muscle Shoals Canal; (b) the construction of a low dam across the river at Lock No. 1 of the lower section of the present canal to provide sufficient depth in the 8 miles of open river between the two sections; and (c) the construction of a lock at the site of Dam No. 2, or the Wilson Dam, with low dams connecting the islands across to the south bank to submerge the rapids at Little Muscle Shoals, and thus provide access to Lock 9 (the lowest lock) of the lower section of the existing canal. All of this work would be for the purpose of completing and making effective

the present Muscle Shoals Canal, which can not now be used to full advantage on account of deficient depth in the river above the upper section, between the two sections, and below the lower section thereof. The cost would be approximately \$8,600,000, but a 5-foot depth only would be provided, and the channel would be narrow and somewhat difficult of navigation. It would, of course, be far less suitable for the development of navigation than that which would be provided by the two high-power dams now under consideration.

To provide a 6-foot channel over this stretch of river the present canal would have to be reconstructed, and work done in the river above and below and between its two sections, similar to that described in the preceding paragraph, but more extensive. The estimated cost of this work would be approximately \$25,786,000. This estimate is based on plans contained in a survey report of Major Harts, Corps of Engineers, of March 21, 1910, published in House Document 360, Sixty-second Congress, second session, and may be assumed as representing the best and cheapest method of providing for a 6-foot navigation over this 80 miles of river if no attention were paid to the development of power. But since large and valuable power can be developed by the completion of Dam No. 2 and the construction of Dam No. 3 at a total cost of only a little more than \$50,000,000, and an even better navigable channel provided, it is not believed that any serious consideration should be given to such a scheme, and that the "value to navigation" should be considered as being something between the mere additional cost of putting locks in these two dams, namely, \$4,285,000, and the cost of providing a 6-foot channel by a lateral canal, namely, \$25,786,000; and probably not less than the \$8,600,000, which would be sufficient to provide a 5-foot depth.

Particular attention is invited to the fact that in order to complete navigation through the Muscle Shoals section Lock and Dam No. 1 is required just above the Florence Bridge. This is a short low dam with a lift at low water of 14 feet, and provides what is in effect a lateral canal between Pattons Island and the north bank of the river. The estimated cost is \$1,400,000.

The CHAIRMAN. That is entirely a navigation proposition?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. It has nothing to do with power?

Colonel BARDEN. No, sir.

The CHAIRMAN. And it is not connected, as far as power is concerned, with either Dam No. 2 or Dam No. 3?

Colonel BARDEN. No, sir.

The CHAIRMAN. That is the dam near the Florence Bridge?

Colonel BARDEN. Just above the Florence Bridge.

The CHAIRMAN. And it does not extend clear across the river?

Colonel BARDEN. No, sir.

The CHAIRMAN. But extends from one side of the river to the island?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. That is the same island that reaches up to Dam No. 2?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. So that the channel, after that navigation dam has been constructed down to the Florence River Bridge, would be on the north side of that island all the way up to Dam No. 2.

Colonel BARDEN. That is correct. There would be simply a low levee 3 or 4 feet high on the north side of the island, then a concrete wall from the upper end of the island across to the lower lock of Dam No. 2.

The CHAIRMAN. Now, Colonel, I want to get a little more elaborate idea in the record about the navigation feature.

You say that if we were to forget all about the development of power and start out on the navigation proposition entirely it would cost, in round numbers, \$25,000,000 to make the Muscle Shoals navigable to a depth of 6 feet?

Colonel BARDEN. Over the section of the river—

The CHAIRMAN (interposing). Over the same section that will be made navigable 6 feet by the building of Dams Nos. 2 and 3?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. Now, then, your plan, if you did not have these dams, to carry out that plan of navigation would in fact be a canal, would it not?

Colonel BARDEN. It would be a lateral canal.

The CHAIRMAN. The navigation would not be as rapid through that canal as it will over the river itself if dams Nos. 2 and 3 are built?

Colonel BARDEN. That is correct.

The **CHAIRMAN**. In other words, even if you spend \$25,000,000 to make this part of the river navigable, its navigability would not be as practical or as good as we will have by the construction of Dams Nos. 2 and 3?

Colonel BARDEN. That is correct.

The **CHAIRMAN**. So that the part of these improvements that we are talking about, the construction of Dams Nos. 2 and 3, that should be charged to navigation, and the part that should be charged to power development ought in no case be less than what it would cost to make the river navigable to the same depth—that is, 6 feet—and in no case—I mean in no case more than that and in no ~~case~~ less than the actual additional cost of constructing the locks of Dams Nos. 2 and 3?

Colonel BARDEN. Yes, sir; \$4,285,000.

The **CHAIRMAN**. Now, then, that price that is properly chargeable to navigation would be somewhere between \$4,000,000, speaking in round numbers, and \$25,000,000?

Colonel BARDEN. Yes.

The **CHAIRMAN**. You could not logically put it above \$25,000,000 and you could not logically put it below \$5,000,000, and men may disagree as to where it should be between those two figures?

Colonel BARDEN. Yes, sir; but, in my opinion, it should not be put much less than \$8,600,000, which is the cost of getting 5-foot navigation; in other words, the cost of completing the incomplete canal.

The **CHAIRMAN**. Five feet is not as good as six, of course?

Colonel BARDEN. No. I have put the lower limit \$8,600,000 rather than \$4,285,000.

The **CHAIRMAN**. And as to just where you would put that figure between \$4,000,000 and \$25,000,000 will have a very important bearing on what you would say would be the cost of the development of any unit of power?

Colonel BARDEN. Yes, sir.

The **CHAIRMAN**. Have any members of the committee anything further to ask? **Senator McNARY**. In the completion of the project as suggested by the chairman, to what extent would the river be navigable?

Colonel BARDEN. I am not certain that I know what you mean.

The **CHAIRMAN**. He has already given testimony on that.

Colonel BARDEN. You are referring to both dams?

Senator McNARY. Yes, sir.

Colonel BARDEN. From the mouth of the Flint River.

Senator McNARY. Between what points?

Colonel BARDEN. From the location of Dam No. 2, the Wilson Dam, 3 miles above Florence, to the mouth of the Flint River, a total distance of 80 miles.

The **CHAIRMAN**. Let Mr. Williams point that out on the map here.

Senator HEFLIN. What is that point where you place your finger there?

The **CHAIRMAN**. That is Dam No. 2.

Colonel BARDEN. The Wilson Dam.

Senator McNARY. Have you ever made an estimate of the commerce that would probably pass along the river in case of the completion of this improvement?

Colonel BARDEN. No, sir. I could not give that.

Senator McNARY. Is there reason to believe that it would be considerable and add to the economic welfare of that section of the country?

Colonel BARDEN. I think it would.

Senator McNARY. What railroad lines serve the commerce contiguous to the river?

Colonel BARDEN. The Southern Railroad parallels the river on the south bank from Florence to Decatur and then crosses to the north bank and follows up that bank to Stevenson, where it again crosses to the south.

The Louisville & Nashville Railroad crosses the river at Decatur in the north and south direction.

Senator McNARY. Then there are two railroad lines that serve that section of the country on either side of the Tennessee River?

Colonel BARDEN. Well, there is only one paralleling the river.

Senator McNARY. The freight to move in bottoms on the river would be local freight, passing from city to city, would it not?

Colonel BARDEN. Well, not local; no, sir. The idea would be that freight would go down the river to St. Louis or even up the Ohio River.

Senator McNARY. Then cotton is largely raised in that section of the country?

Colonel BARDEN. Yes.

Senator McNARY. Do you think cotton would move to the principal ports along that river rather than be shipped by rail to tidewater?

Colonel BARDEN. I would not say that under the present conditions. It is, perhaps, not probable that such would be the case, but it would be possible. And I would also like to state for your information that there are iron furnaces both at Florence and Sheffield, and that they are now actually shipping pig iron by water from Florence down the river. I do not know the destination, but when I left Saturday night a barge was being loaded.

Senator McNARY. If the minimum which you want to charge against this improvement to make the river navigable is \$8,000,000, do you consider that a good investment from the standpoint of the commerce that would probably flow up and down the stream?

Colonel BARDEN. Well, I avoided saying that, Senator. I limited my statement to what would be necessary to provide for navigation. As to whether under present conditions, the Government would be justified in spending that amount of money purely for navigation I would not want to commit myself further than to say that the Engineer Department is on record in 1916 as saying that an expenditure of \$8,575,000 was advisable.

Senator McNARY. From the standpoint of commerce?

Colonel BARDEN. Yes, sir.

Senator McNARY. Is that the Government Engineer Department?

Colonel BARDEN. Yes, sir; the Board of Engineers for Rivers and Harbors and the Chief of Engineers.

Senator HEFLIN. Senator McNary, this Muscle Shoals site there is right in the heart of the coal region and phosphate rock beds and the finest timber region in the country, nearly, and cotton. I have no doubt, would go down this river instead of going on the railroad, practically all of it from the Tennessee Valley.

Senator McNARY. Don't you figure that if it goes by water down the Tennessee it must be reloaded at tidewater into larger vessels if it goes to the markets of the world?

Colonel BARDEN. That would undoubtedly be true.

Senator McNARY. Can you compete with one loading on the railroad?

Senator HEFLIN. It would be cheaper then, I understand. The water rate is cheaper than the rail rate.

The CHAIRMAN. When you get into that, gentlemen, you get into the question of rates. That is, in the first place a very complicated question and, in the next place, a rather unsettled one. As a matter of fact, however, it is demonstrated right in this section of the country, south of it on the Warrior River—just south about 80 miles here is the Warrior River, that flows into. I think, the Tombigbee?

Colonel BARDEN. And the Tombigbee into the Alabama.

The CHAIRMAN. Then into the—

Senator HEFLIN. Mobile Bay.

The CHAIRMAN. Into Mobile Bay. Now, there is a line of boats now making regular trips from New Orleans up to the head of navigation on the Warrior River. They are Government boats. They are not quite paying expenses at the present time. I had quite a talk with the official in charge of it, who was very enthusiastic about his work, and he told me why. He apparently showed a very good reason why it was not paying expenses. One was that the barges that he was operating were barges constructed for work on the Mississippi River in time of war by the Government, which cost the Government \$600,000 apiece. He explained that those barges can be duplicated now by contract for not more than \$175,000, but he is compelled to carry them on his books at \$600,000.

Another thing was the rate situation, and the matter is now before the Interstate Commerce Commission. And this is all in line with Senator McNary's question, because it is a shipment where you have to unload and load again on freight cars, and his question was whether it would pay to do that. Here is an illustration of it: Warrior River runs within 50 miles of Birmingham, one of the largest cities of the South. They are shipping coffee that comes into New Orleans from South America by this water system from New Orleans to Birmingham, Ala. They bring it up the river to within 50 miles of Birmingham and then unload it and reload it on cars and ship it to Birmingham. Before that commenced, before they put on these boats, there was a rate being charged for all rail shipments from New Orleans to Birmingham of 53 cents per hundred. Immediately when they put these boats on the rate dropped to 43 cents a hundred. Then this difficulty occurred: Of that 43 cents a hundred

the railroad takes 38 cents and leaves the Government boats 5 cents. The railroad part of the shipment is 50 miles; the Government part of the shipment is over 400 miles. So that the railroads are getting the best of the deal all the time.

The superintendent told me that they had this up now with the Interstate Commerce Commission. He gave me that as only an illustration of what was going on. Coffee was simply an illustration. He mentioned a great many others where it was worse; where the railroad company took it all, and they had to do all their work for nothing.

Senator HEFLIN. They ship a great deal of cotton, too, on those barges down there?

The CHAIRMAN. I think that any man who will look into it scientifically will reach this conclusion. There is a class of freight, where a railroad line runs right along the river, that ought to go by water instead of by railroad, and there ought to be a difference in rates. The railroad ought not to be allowed to cut the rate for the purpose of putting the boat out of business. That is what Germany is doing on her canals. Certain classes of freight, such as coal and cotton and other things that are not necessary to go through in a hurry, ought to go by water at a lower freight rate than a railroad would be allowed to make, and other things ought to go by rail, where time is part of the essence of the deal. Whether we can ever work that out I am not saying, but there is at least a great field there for shipping of freight partly by water and partly by rail. They ought to be made to coordinate with each other instead of one killing the other and then putting the rate sky-high as quick as they get them out of business.

Senator HEFLIN. The illustration you used, Mr. Chairman, is a very apt one. Whenever they have come in competition with the railroads down there the railroads have put down the freight rates.

The CHAIRMAN. Yes, sir.

Senator HEFLIN. Birmingham enjoys better rates than it did before the Warrior River was opened up?

The CHAIRMAN. Yes, sir.

Senator HEFLIN. If we have navigation on the Tennessee River, there is no doubt on earth about these people getting a better rate on things that they ship out on the boats?

The CHAIRMAN. I want to ask now how far Flint River, where those dams would be built, would be from the end of navigation, so far as this improvement is concerned—how far from there to the mouth of the Tennessee River?

Colonel BARDEN. Three hundred and forty miles, approximately.

The CHAIRMAN. If this improvement were made, Colonel, from there on down to the mouth of the river, would there be any other dams to construct except what is known as Dam No. 1?

Colonel BARDEN. No, sir.

The CHAIRMAN. That would be the only one, to make the river navigable 6 feet, from your Flint River clear to the mouth of the Tennessee River?

Colonel BARDEN. Six feet at ordinary low water and 5 feet at extreme low.

Senator HEFLIN. What is the condition of navigation from there toward Chattanooga?

The CHAIRMAN. There would have to be some more dams constructed.

Senator HEFLIN. The completion of these dams would make it navigable over what distance?

The CHAIRMAN. Eighty miles.

Colonel BARDEN. You mean from Chattanooga to the mouth?

Senator HEFLIN. Yes.

Mr. WILLIAMS. Four hundred and sixty-four miles from Chattanooga to the mouth.

Senator HEFLIN. You would have complete navigation for that distance?

The CHAIRMAN. No, Senator; not necessarily from the construction of these two dams. These two dams would not make it navigable from Chattanooga to its mouth. They would make it navigable from the Flint River to its mouth, excepting that they would have to put in this dam at the Florence River Bridge known as Dam No. 1.

Senator HEFLIN. I thought you were telling me the distance from that river to the mouth?

Mr. WILLIAMS. That is 340 miles. Then you asked the distance from Chattanooga to the mouth, which is 464 miles.

The CHAIRMAN. To make them navigable from Chattanooga to the mouth there would have to be, possibly, work done besides what is proposed in the building of these two dams.

Senator HEFLIN. Both those two dams toward Chattanooga?

The CHAIRMAN. Yes; toward Chattanooga. There is no proposition to provide a depth of more than 3 feet above Chattanooga.

Senator McNARY. I understand.

The CHAIRMAN. At Chattanooga it would be very desirable, of course, if this improvement were made, to make the river navigable up as far as Chattanooga.

Colonel BARDEN. Yes, sir.

The CHAIRMAN. Because that is one of the great manufacturing cities, and there would be a great deal of commerce from there.

Colonel BARDEN. Yes, sir. That is one of the largest cities in the South. I would like to read this report in answer to Senator McNary's question, to show exactly what the Chief of Engineers said about this thing in 1916.

The CHAIRMAN. All right.

Colonel BARDEN. He refers to the report of the district engineer and of the division engineer, and says:

"These reports have been referred, as required by law, to the Board of Engineers for Rivers and Harbors, and attention is invited to its report herewith, dated May 24, 1916. The board states that while the results of the detailed survey and the further studies based thereon suggests some minor modifications in the proposal already before Congress, the report is in all essentials corroborative of the earlier one and presents nothing to change the opinion expressed therein that it is advisable for the United States to take this opportunity of entering into an arrangement with the Muscle Shoals Hydro-Electric Power Co., whereby this serious obstruction to navigation on the Tennessee River will be overcome and at the same time one of the great natural resources of the country will be conserved. The board invites attention, however, to the provisions contained in section 124 of the act to increase the efficiency of the Military Establishment of the United States, approved June 3, 1916, respecting the establishment of nitrate plants to supply Government needs in the manufacture of explosives for military uses, and in view of this legislation it recommends that action on the proposed contract with the Muscle Shoals Hydro-Electric Power Co. be suspended until it has been determined whether the Muscle Shoals power will be utilized for such a nitrate plant. If this question is decided in the negative the board is of opinion that the proposed improvement for combined navigation and power purposes is advisable substantially as proposed by the district officer."

And then the Chief of Engineers says he concurs in the views of the board.

The CHAIRMAN. Of course, that question was decided in the affirmative?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. So the recommendation came to nothing?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. That shows, however, that if we had not made any development at Muscle Shoals, had not started this work, the board was in favor of entering into the arrangement with that private company?

Colonel BARDEN. The board and Chief of Engineers were in favor of this project by which the United States was to contribute \$8,575,000.

The CHAIRMAN. Toward the navigability of the river?

Colonel BARDEN. Toward the navigability of the river.

The CHAIRMAN. Is there anything further that any member of the committee wants to inquire about? If not, I think we had better have Major Burns as our next witness.

STATEMENT OF MAJ. J. H. BURNS, UNITED STATES ARMY.

The CHAIRMAN. Major Burns is the officer who has had charge of the chemical work down there. I understand, Major, you have had nothing to do with the navigation questions or the construction of dams?

Major BURNS. No, sir.

The CHAIRMAN. Your work has been entirely in the building of the nitrate plant?

Major BURNS. Yes, sir. I entered the nitrate problem in the summer of 1919, after practically all of the work had been completed, and since that time I have been Chief of the Nitrate Division of the Ordnance Department, which

has had direct control over the nitrate plants. I am acquainted with the early history through association, but not through direct participation.

The CHAIRMAN. I wish you would go on in your own way, Major, and tell us just what we have there. Just give us a short history of it.

Major BURNS. The Muscle Shoals project is divided into two main parts, the hydroelectric development, that Colonel Barden has just described, and the nitrate or chemical development, that the Ordnance Department has had charge of.

The nitrate project is divided into two plants: United States nitrate plant No. 1, located about a mile southwest from Sheffield, Ala., and nitrate plant No. 2, located about 4 miles northeast of Sheffield, Ala., both on the Tennessee River.

United States nitrate plant No. 2 has, in turn, certain adjuncts, namely, the Waco Quarry, located about 26 miles south of the No. 2 plant, which was constructed for the purpose of insuring a supply of limestone for the manufacture of the product, and the Gorgas power plant, located about 90 miles south of nitrate plant No. 2, which was constructed for the purpose of supplying power for the construction and operation of the nitrate plant. Then there is a transmission line connecting Gorgas with Sheffield, commonly called the Warrior-Muscle Shoals transmission line.

The CHAIRMAN. Major Burns, when you speak of Gorgas, you mean the plant down there?

Major BURNS. Yes, sir; located on the land of the Alabama Power Co.

Senator HEFLIN. On the Warrior River?

Major BURNS. On the Warrior River; yes, sir. The first nitrate plant started was United States nitrate plant No. 1, and the authority for that was the nitrate supply, section 124, of the National defense act of June 3, 1916. After the passage of that act the President and Secretary of War appointed several committees to determine what should be done in order to carry out the provisions of the act, and as a result these committees finally made a report in which they recommended that a plant for the fixation of nitrogen following the synthetic ammonia or Haber process be constructed, with a capacity of about 30 tons of ammonia per day. They also recommended that there be a plant created for the oxidation of a part of this ammonia into a nitric acid, and for the concentration of a part of the nitric acid into a strength of about 94 or 96 per cent.

This general program was followed in the development of nitrate plant No. 1. Construction started in 1917 and was essentially complete at the time of the armistice. There was added to the program of the committee a plant for the manufacture of ammonium nitrate, because of the shortage of explosives that developed during the war. So that the plant as it now stands consists of a synthetic ammonia plant following the general process known as the Haber process, a plant for oxidation of ammonia into nitric acid, a plant for the concentration of nitric acid into a strength of about 94 to 96 per cent, and a plant for the manufacturing of ammonium nitrate from ammonia and nitric acid. It also has extensive housing accommodations for employees and officers who operate the plant, and a steam-power plant with a capacity of about 5,000 kilowatts.

In the operation of the plant a great deal of difficulty was encountered in the synthetic ammonia process, and it was not a success. It was made to work periodically for a few hours at a time, but it always broke down. A really satisfactory plant had not been developed at the time of the armistice. The remainder of the plant, however, was tested out and is successful and can be depended upon to produce its rated capacity.

The CHAIRMAN. Your testimony thus far, major, has been devoted entirely to the one plant there?

Major BURNS. Yes, sir; United States nitrate plant No. 1.

The CHAIRMAN. And that is known as the Haber process?

Major BURNS. Yes, sir. It is a modification of the Haber process, which was developed in the United States by our own chemists.

The CHAIRMAN. To be a little more specific, you say a part of that plant has proven to be a failure? What part of the plant do you refer to?

Major BURNS. It is the plant which has to do with the welding together of nitrogen and hydrogen to form ammonia. That has proven a failure.

The CHAIRMAN. And about what portion of the plant does that constitute?

Major BURNS. In value I should say that it represents approximately one-half of the entire cost.

The CHAIRMAN. Is that of any value now to the Government?

Major BURNS. If the Government were going to complete the plant and make a synthetic ammonia process plant there it would be of value; yes.

The CHAIRMAN. Have you learned, since the war, or have you more information as to the cause of this failure?

Major BURNS. Yes, sir.

The CHAIRMAN. It could be remedied now if you were building it now, could it not?

Major BURNS. Yes, sir; it could be remedied. This was the pioneer plant in America for the fixation of nitrogen by this process, and it would be almost too much to expect that such a large plant as that could have been satisfactorily designed with the lack of knowledge that existed at the time construction was undertaken. We learned a great deal from the construction and operation of this plant and, as a result of the knowledge gained, the General Chemical Co., in combination with the Semet-Solvay Co., organized the Atmospheric Nitrogen Corporation and constructed at Syracuse, N. Y., a plant which follows the process developed at United States Nitrate Plant No. 1, and it is now in successful operation.

The CHAIRMAN. Was the ignorance of our people who were constructing this plant due to inability to get information from Germany, where it seems this kind of plants were in successful operation prior to this time?

Major BURNS. Yes, sir. I don't think that we knew all of the details of the process as it had been developed in Germany.

The CHAIRMAN. Since the war we have learned the entire process?

Major BURNS. Yes, sir.

The CHAIRMAN. Our people are just as competent as the German chemists are to construct a plant along that line now?

Major BURNS. Yes, sir.

The CHAIRMAN. How much would be the loss in money? How much of this machinery would we have to scrap, and how much would it cost to put this plant in running order up to date?

Major BURNS. In my judgment, practically all of the equipment which is now included in the process building would have to be scrapped and new machinery installed; and, in my judgment, in order to round out the plant to make it capable of producing 30 tons of ammonia per day, which is its rated capacity, would cost approximately \$4,000,000. However, some other people state that this estimate is high, but in our general estimate we have allowed a certain amount for tuning up the plant, and making sure that it is workable.

The CHAIRMAN. Now, if this process—the Haber process that you are talking about—could be operated successfully it would be superior to the cyanamid process in the other nitrate plant, would it not?

Major BURNS. In my judgment the possibilities of the Haber process are much greater than are the possibilities of the cyanamid process.

The CHAIRMAN. The cyanamid process requires much more power.

Major BURNS. Yes, sir. It requires 15,000 kilowatts per ton of nitrogen, whereas the Haber process requires only about 4,000 kilowatts per ton nitrogen.

The CHAIRMAN. If you were making explosives by the Haber process at the plant you are now speaking of you would not need this quarry over here, would you?

Major BURNS. No, sir.

The CHAIRMAN. You would not need any limestone that you do need in the cyanamid process?

Major BURNS. No, sir. The raw materials in the Haber process are coke, water, air, and some chemicals to purify the gases and to cause the reactions.

The CHAIRMAN. For the same amount of explosives you would not have near as large an investment as you would in the cyanamid process, would you?

Major BURNS. The capital investment, as far as we know it, is for the Haber process, using the electrolytic hydrogen method \$400 per unit, and for the cyanamid process \$410 per unit. The unit of capacity is capacity for the production of one ton of ammonia per year. So that the capital investment in the Haber electrolytic is slightly less than the capital investment in the cyanamid process. The capital investment in the Haber water-gas process is about \$500 per unit.

The CHAIRMAN. The number of men employed would be less, would it not?

Major BURNS. Yes, sir. The number of men employed would be less. However, the character of the men in the Haber plant would have to be higher, because it involves more complicated manipulations. We have some samples here showing the materials that are used and the materials that are produced.

Senator McNARY. Are these the same samples you had here about two years ago?

Major BURNS. About the same; yes, sir.

The CHAIRMAN. I want to ask you another question or two about these different processes. Later on, of course, you will take up the cyanamid process that we have there, but at the present time, comparing the two, is it a fact known and understood or at least believed by scientific men, chemists, that great improvements in the way of extracting nitrate from the atmosphere can reasonably be expected if we go into the business?

Major BURNS. Yes, sir. I believe the chemical development will be such that it will probably materially increase the efficiency of nitrogen fixation.

The CHAIRMAN. So as a matter of fact both of these processes, to some extent at least, are experimental at the present time?

Major BURNS. The cyanamid process is pretty well worked out.

The CHAIRMAN. The cyanamid process is the one that requires so much power?

Major BURNS. Yes, sir.

The CHAIRMAN. And you must have cheap power in order to make it in an economical way?

Major BURNS. Yes, sir. While the cyanamid process has been very well worked out, the Haber process is much more in its infancy.

The CHAIRMAN. So we would naturally expect if the Government went into this that probably, as time went on, we would scrap a great deal of the machinery, would we not?

Major BURNS. Yes, sir; evolution would unquestionably require that.

The CHAIRMAN. In fact we would want that to come about?

Major BURNS. Yes, sir.

Senator HEFLIN. Mr. Chairman, I recall when we were at plant No. 1 that Senator McKinley said that a great deal of that machinery could be used for power purposes.

Major BURNS. Perhaps so.

Senator HEFLIN. That it would not have to be junked.

Major BURNS. If you could find a market for it as workable machinery, of course it would be much better.

Senator HEFLIN. Was not that your impression, Senator?

Senator LADD. That is my understanding.

The CHAIRMAN. Major, there is another thing I wish you would make plain to me. So far you have been talking entirely about explosives, and, of course, that was the reason these plants were established, primarily; but, incidentally, and quite important, too, the question of fertilizer arises for the utilization of these plants in time of peace. By either one of these processes that we have there, in order to make fertilizer there would have to be additional machinery added, would there not?

Major BURNS. Yes, sir.

The CHAIRMAN. In other words, the course that is taken in getting the nitrates out of the atmosphere runs along a certain line, and when it has reached a certain point, if you are going to make fertilizer you would go in one direction, and if you were going to make explosives you would go in a different direction?

Major BURNS. That is correct, yes, sir, with this—

The CHAIRMAN. In these plants as we have them now nothing has been done in the way of machinery for the purpose of making fertilizer from the point of diversion, has there?

Major BURNS. No, sir.

The CHAIRMAN. I wanted you to make that plain.

Major BURNS. I want to make this modification of that statement, however—

The CHAIRMAN. How much would it cost now, speaking of this plant, to add the machinery necessary to convert the product into fertilizer instead of explosives?

Major BURNS. You would have to put in an ammonium sulphate plant, which would cost in the neighborhood of three quarters of a million dollars.

Before I get off your point, Senator, I would like to make this statement, that ammonium nitrate, the product of either one of these plants, is a good fertilizer material, an excellent plant food, but it has the unhappy property of absorbing moisture so rapidly that if you put it into a fertilizing machine it

gums the passages to such an extent that the fertilizer won't flow through the drills. Therefore it is not rated, at present, as a satisfactory fertilizer material.

The CHAIRMAN. And the additional machinery necessary would be machinery necessary to convert it into material that would be a satisfactory fertilizer material?

Major BURNS. It would have to be converted into a more satisfactory material before it could be used as fertilizer.

Senator HEFLIN. In other words, you have manufactured there already some fertilizer ingredients?

Major BURNS. Yes, sir. When you get nitrogen fixed in the form of ammonia you have the base for an excellent fertilizer material.

Senator LADD. Is it not possible that even this ammonium nitrate might be treated in such a way that it would be readily utilizable in a fertilizer?

Major BURNS. Yes, sir. We have been endeavoring to do that very thing for some time with some system of coating with a substance that will not absorb moisture readily.

Senator LADD. What success have you had?

Major BURNS. We have had some, but I would not want to say that we have reached a successful point as yet.

Senator McNARY. You said the cost would be three-quarters of a million dollars. I don't know whether you finished your answer to the question or not.

Major BURNS. Assuming that the No. 1 plant were a success and were capable of producing to its rated capacity, it would require three-quarters of a million dollars to put in the ammonium sulphate plant that would have to be established to make the product available as fertilizer.

Senator LADD. You already have some sulphuric acid there?

Major BURNS. No, sir; not at that plant. We have at plant No. 2, but not in plant No. 1. I am figuring that this three-quarters of a million dollars would put in the ammonium sulphate plant only and that we would not put in a sulphuric acid plant, but would purchase sulphuric acid from the commercial market.

As I stated before, the raw materials that enter into the final product in the Haber process are air, coke, and water and some chemicals. The first material required is hydrogen, which is to be combined with the nitrogen to form ammonia. Hydrogen is obtained from water gas manufactured, as in all the larger cities of the country, by heating the coke up to white heat and blowing steam through it. As a result the water is broken down into hydrogen and oxygen, and the oxygen, in turn, is combined with the carbon of the coke, and there is obtained a mixture of hydrogen and oxides of carbon. Then the next step is to get nitrogen.

Senator LADD. This first part of the machinery, up to that point, is entirely satisfactory?

Major BURNS. Yes, sir.

Senator LADD. And you will not need any changes?

Major BURNS. No, sir.

Senator HEFLIN. That is at plant No. 1?

Major BURNS. Yes, sir.

Nitrogen is extracted from the air by burning the oxygen out of the air. As a result a mixture of gases is obtained consisting of hydrogen, nitrogen, carbon dioxide, and some other impurities.

The next step is to eliminate everything except the nitrogen and hydrogen, which are the gases to be welded together. This is done by absorbing out the impurities under high pressure. As a result of this purification process there is obtained three parts of hydrogen gas to one part of nitrogen gas in practically a chemically pure state. If they are not in chemically pure state the remaining part of the process can not be satisfactorily performed. The purification of the gases was one of the things that caused much trouble at Muscle Shoals. The purification has to be done under pressure of 100 atmospheres. After the nitrogen and hydrogen are obtained in a purified state, they are brought together at a pressure of 100 atmospheres in the presence of a catalyst and at a temperature of about 600° C. A combination of the two gases ensues, forming ammonia. The catalyst that is used is one of the fundamental features of the process. There seems to be no defined principle at all on which a catalyst works. It seems to be a hit-and-miss proposition. The action of a catalyst is that its presence alone aids in the chemical reaction that takes

place. In one instance iron might aid a reaction, and in another instance platinum might aid, but nobody can tell except by trying which one is going to give good results.

When we started operation of the plant the catalyst was not satisfactory. While it would combine nitrogen and hydrogen under laboratory conditions, it did not act satisfactorily under the working conditions at the plant.

The rest of the process—i. e., the oxidation of the ammonia to nitric acid, the concentration of the nitric acid, and the production of ammonium nitrate—are all commercial propositions at the present time.

The Ordnance Department feels, as far as the synthetic process is concerned, that its object has been achieved, namely, that there should be constantly in operation at least one plant in the United States which uses the synthetic process. And at the present time the Atmospheric Nitrogen Corporation has a plant in full operation at Syracuse, N. Y.

The CHAIRMAN. Have you been there?

Major BURNS. Yes, sir; I have been there on two occasions.

The CHAIRMAN. What power do they use and what is the capacity of their plant?

Major BURNS. Their plant produces about 10 tons of ammonia per day; about one-third the capacity of the No. 1 plant.

The CHAIRMAN. It is a commercial proposition, of course?

Major BURNS. Yes, sir.

The CHAIRMAN. And what do they sell on the market?

Major BURNS. They sell their product as anhydrous ammonia.

The CHAIRMAN. What is it used for?

Major BURNS. It is used essentially in refrigeration.

The CHAIRMAN. And do they have water power?

Major BURNS. No, sir; they have a steam-power plant.

The CHAIRMAN. Are they able to make that and sell the product on the market at a price that can compete with the product that has sold heretofore?

Major BURNS. There is no doubt in my mind but what they are making a substantial profit on their product. We do not know their real costs, because we never asked to see their books, but the product that they make has a very high value from the standpoint of nitrogen, as they are selling it in the form of anhydrous ammonia, which is quoted at above 25 cents per pound, and our judgment is that it does not cost in excess of 10 to 12 cents a pound to make it.

Senator LADD. That is, with their steam plant?

Major BURNS. Yes, sir.

The CHAIRMAN. That would seem to demonstrate, would it not, Major, that the possibilities of Muscle Shoals with the power that we have there would be something great?

Major BURNS. There is this to remember, Senator: That the anhydrous ammonia market is not great. You can get at least twice as much for that material as you can get for ammonia for manufacturing fertilizer.

Senator LADD. The expense of producing the commercial product there would be somewhat more than that at Muscle Shoals?

Major BURNS. Yes, sir.

Senator LADD. Do you know the exact process used there?

Major BURNS. We do not know all the details, but we do know that they are not using exactly the process we tried out at Sheffield. They have developed a much better process.

Senator HEFLIN. If they can produce by steam at about 10 cents a pound, what would it cost to produce it at Muscle Shoals with water power?

Major BURNS. The amount of power used in the Haber process, especially when you get hydrogen from coke and water, is not very great, and therefore the cost of power does not have any appreciable effect on the cost of your final product. It is different in the case of the cyanamid process, because there the power consumption is much greater.

Senator HEFLIN. The power in the synthetic process, compared with the Haber process, is a comparatively small item?

Major BURNS. Yes, sir; it is about one-quarter. There is this that I would like to point out in reference to the use of power in the synthetic process: As I stated, you can get hydrogen through the reaction of steam on hot coke. When you do that, you do not need much power. You can also get hydrogen by the electrolysis of water; in other words, by running an electric current through cells containing water. If you do that, there is consumed about as much power in the synthetic process as there is in the cyanamid process. In our judg-

ment, you can produce ammonia by the synthetic electrolytic process as cheaply as you can do it by the cyanamid process, when power costs 4 mills. If power costs less than 4 mills, the cyanamid process is the more expensive; and if power costs more than 4 mills, the cyanamid process is the less expensive of the two.

The CHAIRMAN. Per kilowatt?

Major BURNS. Per kilowatt. With cheap power there is a great possibility of producing cheap ammonia by the synthetic process, using the electrolysis of water.

The CHAIRMAN. They don't use that up there at Syracuse, do they?

Major BURNS. No, sir; because their power would be too expensive.

Senator HEPLIN. Then, Major, I understand that your position is that fertilizers can be produced very much cheaper by water power than by steam power.

Major BURNS. There is no question about that, Senator. The cheaper the power, the cheaper the final product is going to be, because power is one of the big items of expense of production.

Senator HEPLIN. I understand so.

The CHAIRMAN. Were your relations with the Syracuse Co. pleasant in all respects?

Major BURNS. Excellent, sir.

The CHAIRMAN. Were they willing to give you all the information possible?

Major BURNS. Yes, sir; but we took the stand that we would help them all we could and that we did not want them to give us any of their secrets. At the present time the War Department does not expect to proceed with the development of that plant, and sometimes we find that after obtaining the secrets of a corporation it is pretty hard to properly protect them.

The CHAIRMAN. The development of what plant?

Major BURNS. The development of our No. 1 plant.

The CHAIRMAN. Does the War Department think it ought to be abandoned?

Major BURNS. Yes, sir. We believe that our objective has been accomplished, and that it is not necessary to spend more money on the development of that plant. But that is based upon the assumption that it is desired that commercial development take care of the problem rather than the Government.

The CHAIRMAN. The machinery down there will not produce what you started out to produce, will it?

Major BURNS. No, sir.

The CHAIRMAN. They ought at least to protect it and put it in shape. What would be the object of having the Government expend money there unless it would be in such shape that you could produce it in time of war?

Major BURNS. Before we found out that the atmospheric nitrogen process could produce ammonia by the synthetic process we had every intention of developing the plant. We sent a commission over to Europe to find out what was going on there. We established the Fixed Nitrogen Research Laboratory here in Washington to delve into the question and ascertain what the answer was, and we organized a special engineering section to redesign the plant. We found that we could do the work, and in our judgment we could remodel the plant on the smallest scale that would give us commercial knowledge, and operate it for a sufficient length of time to make sure we had a successful process, for about a million and a quarter dollars. About the time we were ready to go ahead the Atmospheric Nitrogen Corporation's plant proved to be successful. We felt that the objective of the Government had been achieved; that there had been developed in America a plant for the fixation of nitrogen by the synthetic process; and therefore we have felt that the Government is not justified in spending a million and a quarter dollars in perfecting—

The CHAIRMAN (Interposing). The War Department felt that in case war should break out again they would be able to find the product from commercial companies?

Major BURNS. That is correct; yes sir. We felt that the above company could be relied upon to show, in case of emergency, how to fix nitrogen by the synthetic process.

The CHAIRMAN. It would not be necessary for the Government to make it by that process?

Major BURNS. It would not be necessary for the Government to experiment with that process. Of course, it might be necessary for the Government to make it by that process in case of emergency.

The CHAIRMAN. How would you make it? You would have to have a plant to make it.

Major BURNS. You would have to construct new plants in time of war, and we would expect to use the knowledge of the Atmospheric Nitrogen Corporation to build these fixation plants.

The CHAIRMAN. Would you be allowed to without paying for it?

Major BURNS. There has never been any question in my mind but what we could use the knowledge of any firm in America for the construction of new plants in time of emergency.

The CHAIRMAN. But you might have to pay the company a big premium.

Major BURNS. That is true.

The CHAIRMAN. And that would be true even though they originally got their knowledge from the Government's experimental plant.

Major BURNS. I would like to point this out: The process we endeavored to install down there was a modification of the Haber process. The General Chemical Co. had already started to develop the process before the Government got into it. That company is the real pioneer in America in the synthetic process and not the Government. So that we built on their experience, and they in turn built on our experience when they constructed their Syracuse plant.

Senator LADD. Had they originally any other plant than the Syracuse plant?

Major BURNS. Yes, sir. They had a plant, I think, at Laurel Hill, on Long Island, in which they started experimentation.

Senator LADD. And that was not a success?

Major BURNS. It had not progressed very far when the war came on. The Government then took over some of their property in the construction of this nitrate plant No. 1. The General Chemical Co. had not had a chance to try it out thoroughly.

Shall I proceed?

The CHAIRMAN. Are you through with No. 1 now?

Major BURNS. I am, unless there are some further questions.

The CHAIRMAN. All right; go ahead with No. 2.

Major BURNS. Nitrate plant No. 2—

The CHAIRMAN. First, before you leave No. 1, how much has it cost the Government at that plant?

Major BURNS. It cost in round numbers \$13,000,000.

Senator HEFLIN. Just one question right there. The chairman asked you a moment ago what would be done with this No. 1 plant; were you going to abandon it or go on and complete it and make it so that it would work satisfactorily? If private enterprise takes over the project, then it can do what it pleases with it—complete it or take it out or put in new machinery?

Major BURNS. Yes, sir. The Ordnance Department has recommended that it be salvaged.

The CHAIRMAN. What would be done with the steam plant there; would that be salvaged?

Major BURNS. Salvage it all; yes, sir.

The CHAIRMAN. The whole thing?

Major BURNS. The whole thing; yes, sir.

The CHAIRMAN. Has the War Department given any consideration to the question of fertilizer manufacture with this plant No. 1?

Major BURNS. No, sir.

The CHAIRMAN. Have you any definitely formed ideas as to what the possibilities might be there if you took the plant and modernized it and equipped it for the manufacture of fertilizer in time of peace as well as explosives in time of war? What are the possibilities?

Major BURNS. I believe that the plant could be made to pay. In other words, I believe it could sustain itself as a fertilizer proposition in time of peace. Of course, in time of war it would be of great value.

Senator LADD. In other words, by an expenditure of two or three million dollars additional you could utilize the \$13,000,000 that has already been expended by using more of that plant?

Major BURNS. I think that the capital cost would probably run up to some \$4,000,000 in order to make that plant a success, and then you would have to spend year after year the necessary operating expense money, of course. But I think that the returns would be greater than the costs after the plant was well started.

Senator LADD. And the return would be greater from that plant than it would be from the cyanamid plant?

Major BURNS. As I said before, I think that the Haber process has greater possibilities than the cyanamid process.

The CHAIRMAN. Plant No. 1 down there is much smaller in capacity than plant No. 2?

Major BURNS. Yes, sir.

Senator HEFLIN. Plant No. 1 can be completed by the expenditure of \$4,000,000; is that your position?

Major BURNS. Yes, sir; that is correct.

The CHAIRMAN. Of course it is completed now, as far as it could be made. Senator HEFLIN. I mean it could be made so it would work and produce fertilizer?

Major BURNS. Yes, sir.

Senator LADD. In other words, scrapping the machinery that is in the building, utilizing the building, developing and putting in new machinery in the building?

Major BURNS. Yes, sir.

Senator HEFLIN. I understand you to say you could use a great deal of the machinery?

Major BURNS. Personally, I do not think you could use much of the machinery in the process building, but you could use the power plant and gas plant in the process building itself.

Senator HEFLIN. In connection with plant No. 1?

Major BURNS. Yes, sir. You could use a lot of the material that exists there, but you could not use the special equipment that you used in the power plant.

Senator HEFLIN. You are talking now about the equipment that belongs to plant No. 1?

Major BURNS. Yes, sir; that is correct.

Senator HEFLIN. By the expenditure of \$4,000,000 that could be completed made to produce fertilizer?

Major BURNS. Yes, sir; that is correct.

The CHAIRMAN. Now, if there are no further questions, take up plant No. 2.

Major BURNS. Plant No. 2 was started in order to relieve the shortage of explosives developed in 1917 in explosives. At that time our only approved explosive was T. N. T. The demand for explosives in warfare was so gigantic that we could not possibly meet the demand with T. N. T., so we cabled to England to find out how they had solved their explosive problem. England sent two experts to us who stated that England had met its requirements for explosives with ammonium nitrate, which is a mixture of T. N. T. and ammonium nitrate. Their scheme was very logical to the War Department and was adopted, but we found that we had a great task in getting ammonium nitrate as well as in getting T. N. T. This was for two reasons—one that we were short of the necessary ammonia, and the other that we were very fearful of the supply of nitrate from Chile with which we had to produce the necessary nitric acid. So we finally decided to put up the cyanamid plant, which would give us ammonia as well as nitric acid—both from the air. The American Cyanamid Co. had been operating a cyanamid nitrogen fixation plant for several years and were very well equipped to design and operate such a type of fixation plant. So, after considerable negotiation, a contract was entered into between the Government and the American Cyanamid Co. to construct and operate a plant for the Government at Muscle Shoals which would use the only really developed process of nitrogen fixation or the cyanamid process.

The plant consists of a cyanamid plant, a plant for the conversion of cyanamid to ammonia, a plant for the conversion of ammonia into nitric acid, and a plant for the combination of nitric acid with ammonia to form ammonium nitrate. The schedule calls for a capacity of about 110,000 tons of ammonium nitrate per year. The cost of the plant was, in round numbers, \$67,000,000.

Senator HEFLIN. Does that take in the cost of the dams, too?

Major BURNS. No, sir; that is just the nitrate plant alone. It does not include Waco Quarry nor Gorgas Power plant nor the transmission line.

The CHAIRMAN. Nor the steam plant?

Major BURNS. Yes, sir. I should have said also that this plant contains 60,000-kilowatt steam plant.

As an indication of the importance of this plant from a military standpoint it will fix enough nitrogen to supply constantly some 12 divisions fighting in accordance with the organization in existence at the time of the armistice. When our Army was engaged in the Meuse-Argonne offensive, the maximum number of divisions available in the American Army was 30. So No. 2 plant would have been capable of fixing over one-third of the nitrogen required by a force equal to the maximum military effort that America was able to put forth in World War.

I will describe the process in very general terms, Mr. Chairman, by comparing the box of samples of the materials of the No. 1 and No. 2 plants.

You see there are more materials entering into the general process than there are into the synthetic process. We start with limestone. That is burnt to form lime, and then lime and coke are combined in the electric furnace to form calcium carbide. That is the same material that is used commercially for the manufacture of acetylene gas.

Senator HEFLIN. Don't you mix the coke and lime wet?

Major BURNS. No, sir.

Senator HEFLIN. You don't mix them wet?

Major BURNS. No, sir. Just mix them in the dry state.

The carbide is finely pulverized so that the nitrogen which we obtain from the air by liquid air process can easily touch every particle of the carbide. Then this nitrogen gas is blown through the carbide, the carbide is heated to a red heat, and the nitrogen is welded to the carbide and lime nitrogen or cyanamid is formed.

Senator HEFLIN. Where was this made, Major?

Major BURNS. That was made down at Nitrate Plant No. 2.

Senator HEFLIN. At Muscle Shoals?

Major BURNS. Yes, sir.

The lime nitrogen is then ground and treated with steam, and ammonia is formed. This is the same product that you have after the first process in Nitro Plant No. 1. Thereafter the ammonia is converted into nitric acid and nitric acid is neutralized with ammonia to form ammonium nitrate in exactly the same way as at the No. 1 plant.

Senator HEFLIN. Were those other ingredients made down there also?

Major BURNS. Yes, sir. We made the ammonia gas, the nitric acid, and the ammonium nitrate all at Muscle Shoals.

Senator HEFLIN. At plant No. 2?

Major BURNS. Yes, sir. This plant was started in the spring of 1918 and was practically complete at the time of the armistice. We were just starting operations at that time. With the armistice it was practically shut down, and then later on it was decided to make a thorough test of the plant to ascertain whether or not we had a real plant. An operating test run was made in the spring of 1919 on the basis of about 20 per cent of capacity, and that run very thoroughly demonstrated that the plant is a complete success and is able to turn out its full quota of satisfactory material. There were some other things that had to be done from a construction standpoint in order to thoroughly complete the plant, and they were done during 1919, and included the completion of the steam power plant at Muscle Shoals and the testing of it, a few improvements on roads, railroads, and things of a similar nature, and also the creation of a quarry plant at Waco Quarry.

The CHAIRMAN. How much railroad do you have in connection with nitrate plant No. 2?

Major BURNS. Thirty-seven miles.

The CHAIRMAN. That is road running out—

Major BURNS (interposing). No, sir; throughout the plant.

The CHAIRMAN. Throughout the plant?

Major BURNS. Service lines.

The CHAIRMAN. How much limestone rock would this plant use per day?

Major BURNS. We quarry about 2,000 tons, which is crushed, and we have left about 1,200 tons of limestone that is satisfactory for the process. The very fine dust from the crusher can not be used in the process.

The CHAIRMAN. That would be a by-product?

Major BURNS. Yes; that would be a by-product. It would probably be used on farms for liming purposes.

The CHAIRMAN. Again, what is the capacity of plant No. 2?

Major BURNS. It produces 110,000 tons of ammonium nitrate per year, or, put into terms of ammonia, it will produce about 150 tons of ammonia per day, or five times what the No. 1 plant will produce.

The CHAIRMAN. And will make all the explosives that our Army needs?

Major BURNS. It will fix enough nitrogen to take care of about 12 divisions using ammunition at about the same rate that the divisions used it during the war.

The CHAIRMAN. Of course, the Army would not be using that much ammunition every day.

Major BURNS. I am figuring it over a period of time.

The CHAIRMAN. Then it would not supply us with all we needed?

Major BURNS. No, sir; not in a major war.

The CHAIRMAN. Now, you said that it was the idea of the War Department to abandon plant No. 1. Is it the idea to abandon plant No. 2 also?

Major BURNS. No, sir.

The CHAIRMAN. What were you going to do with No. 2?

Major BURNS. The policy with reference to No. 2 is to maintain it in stand-by condition.

The CHAIRMAN. I wish you would say why you want to retain No. 2 and abandon No. 1.

Major BURNS. No. 1 plant will not work to-day and a good deal of additional money would have to be spent on it to make it work. We haven't the money. We haven't the \$400,000,000 that would be required to make it operate. Commercial companies have developed the process and from a war standpoint we do not believe it is necessary for the Government to develop the synthetic process.

The CHAIRMAN. You would not need No. 2, would you?

Major BURNS. Yes, sir; we would need No. 2. And I will show you why a little later. I will show it to you now if you wish.

The CHAIRMAN. No; I don't want to interfere with your regular plan.

Major BURNS. I will explain to you by means of curves why the No. 2 plant is necessary and why the No. 1 plant is not necessary.

The CHAIRMAN. This will probably be a good time to adjourn.

(Whereupon at 11.55 o'clock p. m. the hearing was adjourned to 10.30 o'clock a. m., Thursday, April 13, 1922.)

MUSCLE SHOALS.

THURSDAY, APRIL 13, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris presiding.

Present: Senators Norris (chairman), McKinley, Norbeck, Kendrick, Harrison, and Heflin.

STATEMENT OF MAJ. J. H. BURNS, UNITED STATES ARMY— Resumed.

Major BURNS. Yesterday, Senator, we were discussing United States nitrate plant No. 2.

The prime contractor in the construction of that plant is the Air Nitrates Corporation, which is a subsidiary of the American Cyanamid Co., and there are certain contractual relations still existing between the Government and the Air Nitrates Corporation and the American Cyanamid Co. which are all outlined in the War Department contract called T-66, which, I think, should be inserted in the record.

The CHAIRMAN. Is that the contract between our Government and this contracting company, the Cyanamid Co., or their subsidiary?

Major BURNS. Yes, sir; and there are certain contractual relations with reference to the sale or lease of the plant and with reference to the operation of it from the standpoint of royalties to be paid for the patents owned by the American Cyanamid Co.

The CHAIRMAN. Do you mean to say that if the Government uses that plant to manufacture explosives by that process in time of war they would have to pay a royalty to this corporation?

Major BURNS. Yes, sir; they will have to pay a small royalty in time of war and a larger royalty in time of peace if the plant is operated for the manufacture of fertilizer. It is all outlined in the contract.

Senator KENDRICK. Was not the royalty \$8 during the war?

Major BURNS. Yes, sir; approximately \$8 a ton of nitrogen fixed; yes, sir.

NOTE.—This should be \$12 per ton of nitrogen fixed.

The CHAIRMAN. How much munitions will a ton make?

Major BURNS. A ton of nitrogen would make about 4 or 5 tons of T. N. T., and it would make about the same tonnage of smokeless powder.

The CHAIRMAN. And what about fertilizer?

Major BURNS. A ton of nitrogen would make about 5 tons of ammonium sulphate.

The CHAIRMAN. And ammonium sulphate, 5 tons of that would make how much fertilizer—finished fertilizer to put on the soil?

Major BURNS. It would make about 50 tons.

Senator HEFLIN. That would be about \$8 royalty on materials to make 50 tons of fertilizer?

Major BURNS. We are getting on the wrong track. That is the war royalty. The peace royalty is in excess of \$8 a ton.

NOTE.—It amounts to \$30 per ton of nitrogen fixed.

The CHAIRMAN. Does this contract show what that royalty is?

Major BURNS. Yes, sir; it does. I have not got it clearly in mind just now.

The CHAIRMAN. Then the facts are that the United States Government is not able to make any fertilizer or explosives either to defend itself in time of

war or feed itself in time of peace, unless it pays this corporation for the privilege of doing it?

Major BURNS. That is correct. We would have to pay a royalty to that company for the use of their processes in this plant.

The CHAIRMAN. Has anybody else any patent on the air that we use?

Major BURNS. Yes, sir. We have a liquid air plant at nitrate plant No. 2, which uses the process of the Air Reduction Co. for the separation of oxygen and nitrogen, and they also are entitled to royalties for the use of their process.

The CHAIRMAN. Either in time of peace or in time of war?

Major BURNS. Yes, sir.

I will put in the record the exact royalties. I do not recollect them now.

These royalties are as follows:

Royalty to Air Reduction Co. until January, 1931, is \$2.72 per ton of nitrogen fixed as lime nitrogen, after which date there will be no royalty charge payable to the Air Reduction Co. Royalty to the American Cyanamid Co. was to be \$12 per ton of nitrogen fixed as lime nitrogen until June 1, 1921. After that date it is \$30 per ton of nitrogen content in any and all products manufactured, but this figure, \$30, is subject to arbitration.

Royalties and fees.

	Royalty to—	
	Air Reduction Co.	American Cyanamid Co.
Before June 1, 1921:		
Commercial cyanamid.....	\$0.32	\$2.30
Nitrate of ammonia.....	1.16	5.11
Sulphate of ammonia.....	.59	2.62
After June 1, 1921:		
Commercial cyanamid.....	.52	5.75
Nitrate of ammonia.....	1.16	10.39
Sulphate of ammonia.....	.59	6.18

The CHAIRMAN. Well, then, as a matter of fact the Government can not do anything unless it pays royalties. It can not utilize the air—

Major BURNS. It can not extract nitrogen from the air—

The CHAIRMAN. Without paying some of these corporations for the privilege of doing it?

Major BURNS. It can not extract nitrogen from the air by the Air Reduction Co.'s process without paying royalty to that company for the use of the process which it has developed.

The CHAIRMAN. Now, this process is a patented process?

Major BURNS. Yes, sir.

The CHAIRMAN. Do you know when the patents were issued?

Major BURNS. I believe that the basic patents of the Air Reduction Co. and American Cyanamid Co. expire about 1931.

The CHAIRMAN. Is it not true that out of the investigations made by the Government itself, through its experts, such as yourself, in developing this plant down there, they got additional patents; and have they not been getting patents since the war on this very process?

Major BURNS. Not to my knowledge; no, sir.

The CHAIRMAN. Did the Government make any contract with these people that if there were any improvements made they should have the patent? Do you know about that?

Major BURNS. I do not recollect that right now. I will study the contract. Senator, and I will give you an answer a little later.

NOTE.—The third paragraph of article 8 of the contract applies to this point.

The CHAIRMAN. Have you got the contract separate and apart so that you can put it in the record?

Major BURNS. Yes, sir.

The CHAIRMAN. At this point we will have the contract printed in the record (The contract referred to is as follows:)

AIR NITRATES CORPORATION AND UNITED STATES OF AMERICA; AMERICAN CYANAMID CO. AND UNITED STATES OF AMERICA—ORDNANCE DEPARTMENT, UNITED STATES ARMY—CONTRACT FOR ERECTION AND OPERATION OF THREE AMMONIUM NITRATE PLANTS AND LICENSE AGREEMENT IN RELATION THERETO, DATED AND EXECUTED JUNE 8, 1918.

This contract, made this 8th day of June, 1918, by and between Air Nitrates Corporation, a corporation organized under the laws of the State of New York (hereinafter called the "agent"), party of the first part, and the United States of America, by Samuel McRoberts, colonel, Ordnance Department, National Army (hereinafter called the "contracting officer"), acting by and under the authority of the Chief of Ordnance, United States Army, and under the direction of the Secretary of War, party of the second part,

Witnesseth: Whereas a state of war exists between the United States of America and the German and Austro-Hungarian Governments, constituting a national emergency, and the United States requires the performance within the shortest possible time of the work hereinafter described; and

Whereas the American Cyanamid Company, a corporation of the State of Maine, is the producer of certain chemicals by the so-called "cyanamid processes" necessary for the production of ammonium nitrate, and is familiar with and controls exclusive patents and processes for the production of such chemicals in this country, and proposes to assist the United States in performing this contract as follows:

1. By licensing the United States and the said Air Nitrates Corporation as agent of the United States to use its patents and processes.

2. By placing at the disposal of the said Air Nitrates Corporation all its experiences, records, and plans appertaining to the production of the said chemicals.

3. By placing at the disposal of the said Air Nitrates Corporation certain members of its executive and technical force for the construction and operation of the plants hereinafter mentioned.

4. By placing at the disposal of the said Air Nitrates Corporation all its plants for the purpose of training superintendents, foremen, and chief operatives.

And the United States proposes to compensate the American Cyanamid Company for the foregoing as set forth in a contract marked "Exhibit 1" bearing even date herewith and annexed hereto; and

Whereas the said company is unwilling to subject its property and assets to liability in connection with the planning, construction, and operation of the proposed plants, and has accordingly organized the Air Nitrates Corporation (the agent under this agreement), which shall act as the agent of and which shall be solely responsible to the United States and others in the planning, construction, and operation of the proposed plants, and according to the terms hereof; and

Whereas the United States entered into a contract with the said Air Nitrates Corporation, under date of November 16, 1917, for the construction and operation, as agent for the United States, at Muscle Shoals, Alabama, of a plant for the manufacture of ammonium nitrate, of an approximate capacity of 110,000 short tons of ammonium nitrate per annum, hereinafter referred to as the Muscle Shoals plant, and work thereon has been commenced; and

Whereas it has now become necessary that two additional plants, each with a capacity of approximately 55,000 short tons of ammonium nitrate per annum, shall be constructed and operated at sites to be selected as hereinafter provided; and

Whereas it is desirable that a new contract be entered into for the construction, completion, and operation of all the said plants of an approximate aggregate capacity of 220,000 tons of ammonium nitrate per annum, such new contract to supersede by mutual consent of the parties hereto and in accordance with the best interests of the United States said contract of November 16, 1917:

Now, therefore, in consideration of the mutual agreements herein contained the said parties have agreed and by these presents do agree with each other as follows:

ARTICLE I.

Exclusive services.—The agent shall engage exclusively in the work of executing this contract, including the designing, constructing, and operating of the plants herein described. It shall use its best endeavors to construct the said

plants as quickly as practicable and at the least possible cost consistent with the proper performance of this contract. This shall include availing itself of the cooperation of the American Cyanamid Company to the full extent contemplated in this contract and the one of even date herewith between the United States and the American Cyanamid Company, hereunto attached and marked "Exhibit 1." The agent will maintain such departments as shall be necessary or appropriate for the carrying out of this agreement, including engineering, administrative, purchasing, construction, manufacturing, inspection, labor relations, workmen's compensation, statistical, commissary, police, fire, medical, housing, accounting, and legal departments.

ARTICLE II.

Muscle Shoals site.—The agent shall, at the cost of the United States, conclude the negotiations heretofore begun for the acquisition by and in the name of the United States of the site on which said plant at Muscle Shoals is now being constructed.

Selection and purchase of sites for new plants.—The agent, acting as agent for and at the cost of the United States, shall forthwith select two sites, each suitable for the construction and operation thereon of plants of the character hereinafter described for the production of ammonium nitrate. After such sites shall have been severally approved in writing by the contracting officer, they shall be secured at the sole cost of the United States and be conveyed to the United States of America by deeds in form and substance satisfactory to the contracting officer, subject only to such liens and incumbrances as the contracting officer shall approve in writing. The deeds shall be properly executed and acknowledged in form for recording in the counties in which the sites are located.

ARTICLE III.

Plans for and construction of plants.—The agent, acting as agent for and at the cost of the United States, agrees—

1. To proceed with and complete the planning, laying out, constructing, erecting, installing, and equipping of the said plant at Muscle Shoals with an approximate capacity as aforesaid, and to furnish all necessary labor, tools, machinery, and materials, and to do all other things necessary or appropriate thereto. All plans and specifications in relation to said plant heretofore approved by or on behalf of the Chief of Ordnance or the contracting officer shall be considered for the purpose of this agreement as having had the approval of the Chief of Ordnance and the contracting officer.

2. To plan, lay out, construct, erect, install, and equip at each of said two new sites a complete plant, with an approximate capacity as aforesaid, for the production of ammonium nitrate, furnishing all necessary labor, tools, machinery, and materials, and doing all other things necessary and appropriate in the premises.

Each of said plants shall include the necessary land; also necessary lime, carbide, nitrogen gas, lime-nitrogen, ammonia, nitric acid, and nitrating plants; also all necessary temporary buildings, houses for employees, administrative buildings, laboratories, shops, warehouses, hospitals, stores, commissaries, structures, lines of communication and transmission, plant machinery, railway and trolley tracks, dredging, docks, boiler plants, roundhouses, roads, ways, waste disposal and sewerage, water and lighting systems, locomotives, cars, fixtures, tools, equipment, apparatus, and appurtenances; also power houses adequate for the development and transmission of such power for the operation of said plants as can not be advantageously obtained through outside sources or agencies; also gravel pits, limestone quarries, coal mines, and other things, to such extent and in such manner as may be reasonably necessary for the prosecution of the work contemplated by this contract; but no coal mine shall be acquired without the written approval of the contracting officer.

ARTICLE IV.

Operation of plants.—The agent, acting as agent for and at the cost of the United States, agrees, as and when any part or parts of said plants are sufficiently completed and ready for operation, forthwith to proceed to operate the same and to continue the operation thereof up to June 1st, 1921, and thereafter

for so long as the United States shall remain in the present war, subject to the provisions of Article XVII hereof. The agent shall do all things necessary or appropriate in and about the operation of said plants, including the procurement of all necessary labor and power and the purchase of all necessary materials.

Operation under this article shall include placing ammonium nitrate produced hereunder, as from time to time directed, on cars or lighters or in warehouses at the site of the plant where manufactured.

Revenue from housing, etc.—Any revenue, from the operation of any housing, boarding houses, commissary, stores, infirmary, hospital, or other facilities, or from rebates, refunds, etc., shall be accounted for by the agent to the United States.

ARTICLE V.

Materials.—The United States may at any time furnish the agent any materials necessary for use in the performance of this contract.

ARTICLE VI.

Agent to follow directions.—The agent shall from time to time consult with the contracting officer upon the general character of the work contemplated. Upon written request, made from time to time by the contracting officer, the agent shall inform the contracting officer at the earliest practicable time as to any plan, contract, purchase, and method contemplated in the construction and operation of the plants and properties, and the United States may reject, or from time to time require the agent to modify any such plan, contract, purchase or method, or to substitute therefor and carry out such other plans, contracts, purchases, or methods as in the judgment of the contracting officer may be in the interest of the United States, all at the expense of the United States. The agent in the planning, constructing, equipping, and operation of the plants shall abide by such directions as the contracting officer shall from time to time give the agent. All such requests and directions shall be in writing, or by telegraph, addressed to the agent at its address hereinafter stated.

ARTICLE VII.

Specifications.—The processes and work involved in the manufacture of the final product of ammonium nitrate to be produced hereunder shall be conducted so that said final product may be in accordance with such specifications as the Ordnance Department may from time to time adopt for ammonium nitrate to be manufactured under this contract.

ARTICLE VIII.

Processes.—The said plants shall be constructed for operation under the cyanamid process, unless the United States shall direct that some other process be used, in which case all changes in construction thereby necessitated shall be made by the agent at the cost of the United States.

If at any time hereafter in the judgment of the Chief of Ordnance the oxidation of ammonia and its conversion to dilute nitric acid or the manufacture of ammonium nitrate from dilute nitric acid by interaction with ammonia may be done more advantageously by improved methods or processes of persons or companies that the agent, the Chief of Ordnance shall be free to call upon the agent to install and use such methods or processes in its operation of the plants, at the cost and expense of the United States. The Chief of Ordnance shall be free to consult with parties other than the agent upon all matters relating to the operation of the plants, to the end that the best results of operation may be obtained.

The agent shall use its best efforts to make contracts with its employees pursuant to which any inventions relating or applicable to the production of carbide, cyanamid, ammonia, and nitric acid or ammonium nitrate made by such employees while in the service of the agent, shall be protected by United States patents, which patents shall become the property of the Air Nitrates Corporation, subject, however, to the condition that it shall grant to the United States at the time of issue of such patent or patents a nonexclusive license without royalty under each and all of them, such license to be restricted to the United States and to the purchasers of any or all of said plants who may

receive a license under the provisions of Article X of the agreement of even date herewith between the American Cyanamid Company and the United States. The term "employees" used in this paragraph shall not be deemed to include the persons described in paragraph numbered 3 in Article X hereof.

ARTICLE IX.

Subcontracts.—The agent shall submit to the contracting officer for his written approval, in advance of its execution, any proposed subcontract as to which the contracting officer may direct in writing that his approval be first obtained.

All subcontracts shall contain a reference to this contract and an express provision that they are subject to all provisions hereof and that they may be assigned by the agent to the United States. Upon request in writing a copy of any subcontract shall be delivered to the contracting officer promptly upon the execution thereof.

ARTICLE X.

Costs and expenses—Audit and payment thereof.—The United States shall bear all costs and expenses of every character and description incurred or made in connection with the planning, construction, equipment, and operation of each of the said plants or any part thereof, and in the conduct of any other business or activities of the agent hereunder; and the United States shall supply all money necessary therefor in such amounts and in such manner as to permit all of the agent's activities with respect to the planning, construction, equipment, and operation of the plants to proceed without delays or interruptions and without the necessity of the agent providing any capital or borrowing any moneys. Vouchers for all accounts payable shall from time to time be furnished to the Chief of Ordnance, and upon presentation of satisfactory evidence he shall either furnish the agent funds to the amounts thereof, which funds shall be immediately paid out by the agent under the supervision of a representative of the Chief of Ordnance, or the vouchers may be paid direct by the Chief of Ordnance to the persons entitled to payment thereunder. Such vouchers shall be acted upon by the Chief of Ordnance promptly.

All accounts payable by the United States hereunder, including those in relation to costs and expenses of construction or operation, shall be subject to audit by the United States, which shall maintain at the plants and elsewhere, if necessary, a sufficient number of auditors promptly to audit the same.

To expedite payments to the agent the United States shall detail representatives at each of the said plants and at the agent's home office, with power and sufficient funds to discharge the pay rolls and to make any other payments as they shall become due hereunder. Payments by the United States shall be subject to correction for errors, if any.

The agent shall make no charge to the United States for the following things:

1. For procuring from the American Cyanamid Company a license to it as agent of the United States to use the said company's patents and processes.

2. For procuring from the American Cyanamid Company the disposal, for purposes of the Air Nitrates Corporation, of the said company's experiences, records, and plans appertaining to the production of the said chemicals hereinabove referred to.

3. For procuring from the American Cyanamid Company the disposal, for the purposes of the Air Nitrates Corporation, of the following members of the said company's executive and technical force, namely: The president, vice president, and general manager, sales and traffic manager, engineering assistant to general manager, superintendent of manufacture, chief technologist, chief engineer, assistant engineer, and, in addition thereto, in connection with the operation of the said plants, two principal works managers, as such offices may from time to time be filled.

4. For procuring from the American Cyanamid Company the disposal, for the purposes of the Air Nitrates Corporation, of all of the said company's plants for the purpose of training superintendents, foremen, and chief operatives.

ARTICLE XI.

Agent's compensation.—As full compensation for the services of the agent the United States shall pay to the agent the following fees:

1. *Construction fee.*—Three and one-third ($3\frac{1}{3}$) per cent of the cost in connection with the construction and equipment of the said plants, until such cost

(exclusive of the agent's compensation) shall equal thirty million (30,000,000) dollars, and thereafter one and two-thirds ($1\frac{2}{3}$) per cent of such cost in excess of said thirty million (30,000,000) dollars. Said fee shall be payable monthly upon that portion of the cost for which payment has been made during the month or months preceding and as to which the fee is unpaid. There shall be credited on account of said construction fee any payments for construction compensation heretofore made to the agent under the provisions of said contract of November 16, 1917. The total of the construction fee shall not exceed one million five hundred thousand (1,500,000) dollars.

2. *Operation fee.*—One-quarter of one cent (\$0.0025) per pound of ammonium nitrate produced in compliance with Article VII hereof, and accepted or utilized by the United States, up to and including 110,000 tons produced in any fiscal year of the United States, and one-eighth of one cent (\$0.00125) per pound of ammonium nitrate so produced and accepted or utilized in any said fiscal year in excess of such 110,000 tons. Payment shall be made monthly.

The Chief of Ordnance may direct the agent to produce at any one or more of said plants products other than ammonium nitrate, and to the extent that such products are not utilized in the making of ammonium nitrate in any of said plants operated by the agent, the agent shall receive as compensation for making such products an operation fee computed upon such a basis as will give the agent for making such products the same amount as the agent, by way of operation fee, would have received (1) where such products are nitrogenous compounds, for fixing an equivalent amount of nitrogen in the form of ammonium nitrate, and (2) where such products are other than nitrogenous compounds, for making ammonium nitrate equivalent in cost to that of such products.

ARTICLE XII.

Basis of cost for construction fee.—The cost upon which the construction fee of the agent is based shall be the entire cost of the construction of the plants herein mentioned, including, amongst other items, those mentioned in Schedule A, hereto annexed and made a part hereof. The enumeration of said items shall not be deemed to be inclusive of all items of cost and shall not be construed to exclude in determining cost and the fee thereon other items of expenditure entering into the cost of planning, constructing, and equipping the plants not therein enumerated.

ARTICLE XIII.

Maintenance.—The agent shall, at the expense of the United States, maintain the plants in suitable condition for economical operation, and to this end it shall make all proper repairs. The contracting officer may from time to time specify extraordinary repairs, which shall be made only with his written approval. Should any part of any plant be destroyed wholly or partly by fire or otherwise, the Chief of Ordnance shall determine whether such part shall be restored.

ARTICLE XIV.

Title to property.—The title to all property, real or personal, paid for or partly paid for by the United States shall, immediately upon such payment, or upon coming into the possession of the agent, vest forthwith in the United States.

ARTICLE XV.

Records.—The agent shall keep complete records as to all construction and operation expenses, all of which records shall at all times be open to the inspection of the duly authorized representatives of the United States.

Inspection.—The inspection officers of the Ordnance Department shall at all times have full access to the plants for the purpose of inspecting in every detail all work done, materials used, and ammonium nitrate produced, and becoming familiar with all processes and methods used in the manufacture thereof, and the agent shall afford them all necessary facilities and assistance for performing their duties aforesaid.

ARTICLE XVI.

Loss and damage.—The agent in operating, caring for, and storing property shall use all reasonable effort adequately to protect the same, but this shall not authorize or require the agent to take out or carry insurance for this purpose.

The United States shall hold and save harmless the agent from all loss or damage (exclusive of future profits) by accident, fire, flood, explosion, or otherwise arising or growing out of the construction or operation of the said plants, and all losses and expenses not compensated by insurance or otherwise.

ARTICLE XVII.

Termination of agreement as to any plant.—In the event that, in the opinion of the Chief of Ordnance, the public interests so require, this contract may be terminated as to any or all of the plants described herein by notice in writing to the agent without prejudice to any claim which either of the parties hereto may then have against the other. In the event of the termination of this contract as aforesaid, the United States shall pay to the agent all costs and discharge all obligations of the agent arising in connection with the construction or operation of the said plant or plants theretofore properly incurred, but not previously paid or discharged, as to which said notice is given. At the option of the United States, the agent shall assign or transfer to the United States all contracts outstanding at the date of termination as to any plant previously entered into by the agent hereunder in respect of such plant. In addition thereto the United States shall make the following payments under the following conditions:

(1) In the event that this contract is terminated as aforesaid as to any plant during the construction thereof, if the agent is not in default in any substantial agreement herein contained, the United States shall pay the agent such percentage of the construction fee provided for in Article XI hereof and not theretofore paid as may be found by the Chief of Ordnance as fairly and justly amounting to the percentage of the work then performed, including obligations incurred in respect to said plant, and for which payment has been or will be made.

(2) In the event that this contract is terminated as aforesaid as to any plant during or prior to the operation thereof by the agent, then the agent shall be paid the sum of money, if any, then due on account of the production of ammonium nitrate in said plant, and the United States shall thereafter continue to pay during the period set forth in Article IV hereof to the agent for the ammonium nitrate produced therein one-quarter of one cent (\$0.0025) per pound for all ammonium nitrate produced in said plant in any fiscal year of the United States until such date in said year as the amount produced at said plant, together with that produced by the other plants referred to herein, shall equal one hundred and ten thousand (110,000) tons; and as to the amount produced in said plant in said fiscal year, if any there be, after the said one hundred and ten thousand (110,000) tons of ammonium nitrate have been produced as aforesaid, the United States shall pay the agent one-eighth of one cent (\$0.00125) per pound. The aggregate payments to the agent under this paragraph (2) on account of plants as to which this contract may have been terminated as aforesaid, shall not exceed five hundred and fifty thousand dollars (\$550,000) in any said fiscal year. Wherever the designation ammonium nitrate is used in this paragraph (2), it shall be deemed to include other products, described in paragraph numbered 2 in Article XI hereof, if any there be, produced in the plants described herein, but the fees due on said other products shall be calculated and determined according to the provisions of said paragraph (2) of Article XI hereof.

Provided, however, and it is understood and agreed, that this contract shall not be terminated as to any plant prior to June 1, 1921, or so long as the United States shall remain in the present war, except for the permanent cessation of all activities of the United States in connection with said plant, unless the agent exhibits such default or negligence as respects such plant as to require that the United States in its best interests should directly construct and operate said plant.

In the event of the termination of this contract as to any plant or plants aforesaid, the agent agrees to cooperate with the United States and to give to it its good offices and such assistance as the United States may from time to time request, in making the planning, construction, equipment, and operation of such plants successful and economical in all respects.

ARTICLE XVIII.

Right of United States to discontinue.—Nothing in this contract contained shall be deemed to prevent the United States from at any time discontinuing construction or operation of any or all of the said plants, and in the event

of such discontinuance the United States shall be under no liability to the agent for any payments as respects such plant or plants beyond those in this agreement specified. In the event that construction or operation is resumed at any of said plants at which construction or operation has been discontinued, the provisions of this contract shall govern the rights and obligations of the parties with respect to any such plant to the same effect as though the construction or operation thereof had not been discontinued.

ARTICLE XIX.

Sale of plants.—If upon cessation of this war or for any other reason the United States determines to cease the construction, equipment, or operation of any of the said plants and to dispose of the same, the agent shall be given the first opportunity (for a reasonable period of time not to exceed six months after receipt of written notice stating the determination of the United States to dispose of the same, and the material terms upon which such disposition will be made) to purchase the same upon as favorable terms as the United States is willing to accept therefor, before the United States shall sell the same to any other party.

ARTICLE XX.

Bond.—The agent shall furnish to the United States within 20 days after the execution of this agreement a bond in the sum of five hundred thousand (500,000) dollars, conditioned upon the full and faithful performance by the agent of all terms, covenants, and conditions of that part of this agreement providing for the construction of said plants. The surety on said bond and the form thereof shall be satisfactory to the contracting officer. Unless such bond is furnished within said time limit this agreement may, at the option of the contracting officer, be cancelled.

ARTICLE XXI.

Contract nonassignable.—This contract shall not, nor shall any right to receive payment or any other interest therein, be transferred or assigned by the agent to any person, firm, or corporation without the written consent of the Secretary of War.

Disputes.—Except as this contract shall otherwise provide, any doubts or disputes which may arise as to the meaning of anything in this contract shall be referred to the Chief of Ordnance for determination. If, however, the agent shall feel aggrieved at any decision of the Chief of Ordnance upon such reference, he shall have the right to submit the same to the Secretary of War.

Persons not to benefit.—No Member of or Delegate to Congress or Resident Commissioner, nor any person belonging to or employed in the military service of the United States, is or shall be admitted to any share or part of this contract, or to any benefit that may arise therefrom, but this article shall not apply to this contract so far as it may be within the operation or exception of section 116 of the act of Congress approved March 4, 1909 (35 Stat. 1109).

Prison labor.—No persons shall be employed in the performance of this contract who are undergoing sentences of imprisonment at hard labor which have been imposed by the courts of the several States, Territories, or municipalities having criminal jurisdiction.

ARTICLE XXII.

Service of notices.—Any notice addressed to the agent at 511 Fifth Avenue, New York, N. Y., or at such other address as the agent shall by notice in writing advise the contracting officer, and either there delivered or deposited in a postpaid wrapper in any post-office box regularly maintained by the United States, shall be deemed to have been served upon the agent. Nothing herein contained shall preclude service of notices upon the agent by delivery thereof to any of its corporate officers in person.

ARTICLE XXIII.

Prior agreement superseded.—This agreement shall supersede the agreement of November 16, 1917, between Air Nitrates Corporation and the United States, by which Air Nitrates Corporation is authorized to act as agent of the United

States in the construction and operation of the Muscle Shoals plant hereinbefore referred to.

Provided, however, that such supersession shall not affect any of the rights or obligations of the parties hereto which have accrued or become fixed under said agreement of November 16, 1917, prior to the date hereof, except in so far as it is clearly intended by these presents that such rights or obligations shall be affected, whether through extinguishment, the substitution of others therefor, or otherwise.

Provided, also, that such supersession shall not in any way affect any of the subcontracts, obligations, or commitments which the Air Nitrates Corporation has heretofore in good faith entered into, made, or incurred under said agreement of the 16th of November, 1917.

ARTICLE XXIV.

New contract for deficiency in appropriations.—In the event that the existing appropriations applicable to the purposes of this agreement shall be inadequate, the United States shall have the right to execute and deliver, and the agent shall thereupon also execute and deliver, a new contract having the same terms and conditions as are contained herein.

ARTICLE XXV.

Definitions.—Wherever in this contract the words hereinafter enumerated are used they shall mean what is set opposite them:

Agent: The part of the first part and its duly authorized representatives, successors, and assigns.

Chief of Ordnance: The Chief of Ordnance, the Acting Chief of Ordnance, or any duly authorized representative of either.

Contracting officer: The contracting officer executing this contract, his successor or successors, his or their duly authorized agent or agents, and anyone from time to time designated by the Chief of Ordnance to act as contracting officer.

Ton: Two thousand (2,000) pounds.

Fiscal year of the United States: The period from July 1st in any year to June 30th in the following year, both dates inclusive.

In witness whereof, the parties hereto have caused these presents to be executed and delivered, in triplicate, at Washington, D. C., the day and year first above written.

AIR NITRATES CORPORATION.
By _____,
 President.

 Secretary.
UNITED STATES OF AMERICA.
By _____,
 Col., Ord. Dept., N. A.,
 Contracting Officer

SCHEDULE A.

ITEMS OF COST REFERRED TO IN ARTICLE XII.

(a) All the land, including gravel pits, quarries, and coal mines, labor, material, machinery, fixtures, equipment, apparatus, appurtenances, tools not owned by the workmen, supplies and equipment necessary for either temporary or permanent use for the construction and operation of the plants, including the opening up and operation of gravel pits, quarries, and coal mines.

(b) Rental for construction plants and for the main and branch offices, and for furnishings and equipment for such offices.

(c) Loading and unloading construction plant, the transportation thereof, including transportation to and from the place or places where it is to be used in connection with said work, the installation and dismantling thereof and ordinary repairs and replacements during its use in the said work.

(d) Transportation and expenses, including transportation tax to and from the work of the necessary field and office forces, procuring labor, and expediting

the production and transportation of material and equipment. All freight charges on equipment, furnishings, material, and supplies, including transportation tax thereon.

(c) Salaries of managers, engineers, superintendents, timekeepers, accountants, clerks, foremen, and other employees at the main and field offices of the agent in connection with said work, salaries of the executive officers of the agent, except such as shall be placed at the disposal of the agent by the American Cyanamid Company and set forth in said contract marked "Exhibit 1."

(f) Buildings, houses, warehouses, hospitals, infirmaries, stores, commissaries, and structures, and the equipment required therefor and furnishings and equipment required for main and field offices, and the cost of maintaining and operating the same, and including such minor expenses as telegrams, telephone service, expressage, postage, etc.

(g) Buildings of different grades, warehouses, local power plant, structures, plant machinery, railway and trolley tracks, locomotives, cars, roundhouses, roadways, grading and sewerage, water and lighting systems, and fixtures.

(h) All bonds required by this agreement and all bonds necessary or proper, fire, liability, and other insurance, and all losses and expenses not compensated by insurance, which have been actually sustained by the agent in connection with said work. Such losses and expenses, when incurred by the agent in connection with damage to third persons resulting from the work or due to the agent's fault or neglect, shall be included in the cost of the work, but not for the purpose of determining the agent's fee; but such losses and expenses, when incurred by the agent in connection with constructing and replacing any of the work destroyed or damaged, shall be included in the cost of the work for all purposes hereunder.

(i) Permit fees, royalties, and other similar items of expense incidental to the execution of this agreement.

(j) Transportation, including all transportation tax, traveling and hotel expenses, and telephone, telegraph, mail, and express, expenses of officers, engineers, and other employees of the agent as are actually incurred in connection with this work.

(k) Amounts paid to contractors or subcontractors and sums paid by the United States upon contracts made with any person at the request of the agent, and the cost of all materials furnished by the United States.

(l) All manner of expense of the agent in creating and constructing the plants and their equipment, including administration, superintendence, engineering, materials, labor, freights, transportation tax, power, heat, light, rentals, insurance liabilities, losses not covered by insurance and all overhead, general, and legal cost and expense, and including all other items of expenditure made by the agent not properly chargeable to manufacturing.

(m) In addition thereto further allowances, if any there be, of cost as from time to time may be made by the contracting officer.

EXHIBIT I.

LICENSE AGREEMENT.

This agreement entered into this 8th day of June, 1918, between American Cyanamid Company, a corporation organized and existing under and pursuant to the laws of the State of Maine, of the first part, hereinafter called the licensor, and the United States of America, hereinafter called licensee, by Samuel McRoberts, colonel, Ordnance Department, National Army, hereinafter called the contracting officer, acting by and under the authority of the Chief of Ordnance, United States Army, and under the direction of the Secretary of War, of the second part.

Witnesseth: Whereas the licensee has entered into an agreement of even date herewith with Air Nitrates Corporation, a corporation organized and existing under and pursuant to the laws of the State of New York, by which agreement said corporation has agreed as agent of the licensee to construct and operate for the licensee plants for the manufacture of ammonium nitrate, all for the reasons and as is more particularly set forth in said agreement; and

Whereas the licensor possesses certain United States letters patent and is the owner of exclusive licenses under certain other letters patent of the United States, all as set forth in Schedule A hereto annexed and made a part hereof,

covering certain processes and methods involved in the manufacture of lime nitrogen (calcium cyanamid), its conversion to ammonia gas and the oxidation of ammonia to weak nitric acid, and may grant licenses thereunder; and

Whereas the licensor, to enable said Air Nitrates Corporation to carry out said agreement, will place at the disposal of said corporation its experiences, studies, records, designs, plans, and certain of its executive and technical force, all as hereafter set forth; and

Whereas the licensor entered into a contract with the licensee under date of November 16, 1917, which contract was executed on behalf of the licensee by J. W. Joyes, colonel, Ordnance Department, United States Army, contracting officer, with respect to the license hereinafter granted:

Now, therefore, in consideration of the mutual agreements herein contained, the said parties have agreed, and by these presents do agree, to and with each other as follows, to wit:

ARTICLE I.

License to use certain patented processes, etc.—The licensor, for use and application exclusively by the United States Government of the aforesaid agent at said plants, has given, granted, assigned, and does hereby give, grant, and assign to the licensee the right, license, and privilege to use any and all of the processes, methods, and designs covered by letters patent of the United States and involved in the manufacture of lime nitrogen (calcium cyanamid), its conversion to ammonia gas and the oxidation of the ammonia to weak nitric acid, which said letters patent are described in Schedule A, annexed hereto and made a part hereof, for and during the time the United States shall remain in the present war, and in any event until June 1, 1921, together with all improvements therein and all patents or other rights relating thereto which the licensor may hereafter make or secure during said period.

The licensor agrees that nothing contained in this agreement shall restrict the licensee to the use only of such rights and patents, as the licensor now possesses or may hereafter possess, and the licensee has the privilege of using the processes, rights, and patents of persons other than the licensor, either in conjunction with the processes, rights, and patents of the licensor or independent thereof, if in the judgment of the contracting officer such action is required to obtain the best results of operation.

ARTICLE II.

Use of licensor's experiences, records, etc.—The licensor agrees to place at the disposal of the said Air Nitrates Corporation and the contracting officer, for the production of ammonium nitrate and the construction and operation of the plants referred to in the agreement between the licensee and the Air Nitrates Corporation above referred to, all the experiences, records, studies, designs, and plans of the licensor bearing on and pertaining to the processes necessary or incidental to the manufacture of ammonium nitrate now owned by the licensor, and agrees that the said Air Nitrates Corporation and its representatives and the contracting officer shall have access to said experiences, records, studies, designs, and plans at all reasonable hours and shall be permitted to make copies thereof and excerpts therefrom. The licensor further agrees to divulge to the said Air Nitrates Corporation and the contracting officer for the sole purpose of this agreement and said agreement between Air Nitrates Corporation and said licensee, all of the secret processes which, combined with the processes covered by the aforesaid letters patent, go to make up the system of manufacture of ammonium nitrate.

ARTICLE III.

Use of licensor's plants for training purposes.—The licensor agrees to place at the disposal of the said Air Nitrates Corporation and the contracting officer all of the plants now owned or operated by the licensor for the purpose of training of superintendents, foremen, chief operatives, and the like for the proposed plants to be constructed and operated by the Air Nitrates Corporation, and further agrees that the said corporation and its representatives and the contracting officer shall have access to said plants at all reasonable hours for the purpose above referred to.

ARTICLE IV.

Services of certain of licensor's technical men.—The licensor agrees to place at the disposal of the said Air Nitrates Corporation for the construction and operation of the plants under the contract above referred to the following members of the executive and technical forces of the licensor as from time to time constituted, namely, president, vice president and general manager, engineering assistant to general manager, superintendent of manufacturing, sales and traffic manager, chief technologist, chief engineer, assistant engineer, and, in addition thereto, in connection with the operation of said plants, two principal works managers; and further agrees to pay the entire salaries of such persons during the terms of said agreement between the licensee and said corporation, and agrees that at all times it will maintain an executive and technical force which shall be familiar with the operation of the processes involved in the manufacture of ammonium nitrate.

ARTICLE V.

Benefit hereunder to accrue to Air Nitrates Corporation.—The licensor agrees that all of the benefits to accrue to the licensee by the terms of this agreement may be at any time assigned to the Air Nitrates Corporation and shall in any event accrue to the Air Nitrates Corporation, but only for the purposes of said agreement between the United States and the Air Nitrates Corporation. The licensor shall have the right to grant, and at the written request of the licensee will grant, a license in all respects similar to the license herein granted to the Air Nitrates Corporation to enable said corporation to carry out its agreement with the United States of even date herewith.

ARTICLE VI.

Royalty.—In consideration of the granting of the license provided for in Article I hereof and of the other conditions to be performed by the licensor, the licensee agrees to pay the licensor during the term thereof specified in said article, as royalty, an amount equivalent to six mills (\$0.006) per pound of all nitrogen fixed as lime nitrogen manufactured at the plants hereinbefore described in the contract of even date herewith between the United States and the Air Nitrates Corporation, and to which reference has hereinbefore been made, up to and including the first ninety-one million seven hundred thousand (91,700,000) pounds of such nitrogen so fixed in any fiscal year of the United States, and in addition thereto three mills (\$0.003) per pound of all nitrogen fixed as lime nitrogen in any said fiscal year in excess of the said ninety-one million seven hundred thousand (91,700,000) pounds of nitrogen, it being further understood and agreed that no part of such royalty shall directly or indirectly inure to the benefit of an alien enemy of the United States except as may appear upon a disclosure of stock lists made pursuant to law. Payment for royalties shall be made each month as early in the month as practicable upon the presentation of satisfactory evidence showing the production during the preceding month of nitrogen fixed as lime nitrogen at the plants hereinbefore referred to.

ARTICLE VII.

Acknowledgment of ownership of patents, processes, etc.—It is understood and agreed that so far as the right, license, and privilege to use any and all of the patents, processes, methods, and designs, as described in Schedule A hereto annexed, is given, granted, and assigned hereby, the Government and its agents and other parties claiming under this license, do and they shall acknowledge and recognize the American Cyanamid Company as the sole owner of said patents, processes, methods, and designs and of the exclusive right to use the same, subject only to the rights granted to the United States by this license and any license granted said Air Nitrates Corporation, and the United States shall, so far as practicable, exclude the public from all works in which said processes shall be employed, and generally shall use all reasonable means to preserve said rights unimpaired.

ARTICLE VIII.

Indemnity against infringement.—To the extent only that the licensor shall have received cash hereunder the licensor agrees to defend and save harmless the Air Nitrates Corporation and the United States from all suits and claims

for infringement by reason of the use by either of them of its patents for the making of cyanamid and the making of ammonia gas, which said patents are described in Schedule B hereto annexed and made a part hereof, and pay any judgments which may be obtained therefor against the licensee or the said Air Nitrates Corporation, but only to the extent aforesaid.

The licensor will defend and save harmless the licensee and the Air Nitrates Corporation from any action or suit brought by any person in privity with it in which the right of said licensee or said corporation to use said patents described in said Schedule A shall be attacked: *Provided, however,* That the United States shall promptly give the licensor written notice of any and all such suits, actions, or claims described in this article and tender the defense thereof to the licensor.

ARTICLE IX.

Termination of agreement as to any plant.—In the event that the United States shall terminate this agreement as to any one or more of the plants to be constructed by the Air Nitrates Corporation under said agreement of even date herewith and pursuant to the provisions in that behalf therein contained, all of the rights and privileges herein inuring to the said Air Nitrates Corporation shall inure in respect of the plant or plants as to which said agreement is terminated, to the benefit of the United States, but only until June 1, 1921, and so long thereafter as the United States shall remain in the present war.

ARTICLE X.

License to use patents, processes, etc., after 1921 or the end of the war; arbitration of royalties thereunder.—The licensor hereby gives and grants to the licensee, in addition, for use and application exclusively by the licensee in the operation of the aforesaid plants, the right, license, and privilege to use any and all of the patents, processes, methods, and designs embraced in the license hereinbefore granted to the licensee by Article I hereof, from and after the first day of June, 1921, or the date upon which the United States shall cease to be in the present war (whichever date shall last occur) and until the expiration of the United States patents covering the same, upon the following terms, to wit:

The licensee shall pay monthly to the licensor for such additional license under this article a royalty, unless and until changed by the arbitration hereinafter provided, of one and one-half cents (\$.015) per pound of nitrogen content in any and all products manufactured by the licensee at each and every of said plants under and by the use of any of the patents, processes, methods, or designs embraced in the said additional license.

In the event that either the licensor or the licensee shall be dissatisfied with the aforesaid royalty in this article defined, either or both may, within the first three years of the period fixed for the duration of said additional license, demand that the amount of the royalty to be paid hereunder shall be determined and fixed by arbitration. Such demand shall be made in writing and shall be delivered to the other party hereto, together with the name and address of the arbitrator chosen by the party demanding the arbitration, and the other party hereto shall, within fifteen (15) days thereafter, choose a second arbitrator and notify the party demanding the arbitration of its choice and give the name and address of such arbitrator. The two arbitrators so chosen shall, within fifteen (15) days after being notified by either party that the second arbitrator has been chosen, choose a third arbitrator. The arbitrators, when chosen, shall promptly fix a time and place for the hearing, and then and there the parties hereto shall attend and present their respective proofs and arguments. The hearing may from time to time be adjourned by the arbitrators by a writing notifying the parties of the time and place to which such adjournment is made.

The arbitrators shall with all reasonable speed ascertain and determine what, in their opinion, under all the circumstances, are adequate and reasonable royalties to be paid under this article and the date, not earlier than that of the demand for such arbitration, from which the said award shall be effective. They shall notify the parties in writing of the royalties so ascertained and determined and state the amount, if any, that either party may then owe to the other with respect to royalties under the terms of the award. The said award when signed by any two of the arbitrators shall be final and conclusive upon all parties concerned.

In the event that either the second or the third arbitrator shall not be chosen in the manner and within the time hereinabove fixed, any United States district judge for the Southern District of the State of New York, upon the application of either party, may choose an arbitrator or arbitrators, as the case may be, to act.

No terms with respect to royalty contained in this agreement or in the said agreement of November 16, 1917, or in any agreement between said Air Nitrates Corporation and the United States, or in any negotiations or proposals between the said several parties looking to the making of the said agreements or relating to the subject matter thereof shall be utilized by either party in said arbitration or taken into consideration by the arbitrators in making their award.

The costs and expenses of the arbitrators and of the arbitration shall be ascertained by the arbitrators and shall be borne equally by the parties hereto.

The licensee may transfer to the purchaser of any one or more of said plants the right to avail itself of the license in this article granted in the operation of the plant or plants so purchased, if said purchaser, as a term of said purchase, expressly covenants to undertake, observe, and perform all the terms of this article, including the payment of royalties and the findings of the said arbitrators, if any, as respects the plant or plants so purchased.

ARTICLE XI.

Cessation of royalties.—If the use of the inventions of the aforesaid letters patent and the methods, apparatus, and processes owned by the licensor and disclosed hereunder to the Air Nitrates Corporation and the licensee shall be discontinued by the Air Nitrates Corporation or by the licensee or its assigns, the obligation for the payment of royalties hereunder shall cease as to those of said parties who shall have so discontinued such use.

ARTICLE XII.

Contract not assignable.—This contract shall not, nor shall any right to receive payment, or any other interest herein, be transferred or assigned by the licensor to any persons, firms, or corporations.

ARTICLE XIII.

Persons not to benefit.—No Member of or Delegate to Congress, or Resident Commissioner, is or shall be admitted to any share or part of this contract or to any benefit that may arise therefrom, but this article shall not apply to this contract so far as it may be within the operation or exception of section 116 of the act of Congress approved March 4, 1909 (35 Stat. 1109).

ARTICLE XIV.

Disputes.—Except as this contract shall otherwise provide, any doubts or disputes which may arise as to the meaning of anything in this contract shall be referred to the Chief of Ordnance for determination. If, however, the licensor shall feel aggrieved at any decision of the Chief of Ordnance upon such reference, he shall have the right to submit the same to the Secretary of War.

ARTICLE XV.

Definitions.—Whenever in this contract the words hereinafter enumerated are used they shall mean what is set opposite them.

Licensor: The party of the first part and its legal representatives, successors, and assigns.

Chief of Ordnance: The Chief of Ordnance, the Acting Chief of Ordnance, or any duly authorized representative of either.

Contracting officer: The contracting officer executing this contract, his successor or successors, his or their duly authorized agent or agents, and anyone from time to time designated by the Chief of Ordnance to act as contracting officer.

ARTICLE XVI.

New contract for deficiency in appropriations.—This agreement shall be binding upon the licensor for the term of the license, but in the event of the existing appropriations applicable to the purposes of this contract being made

quate, the licensee shall have the right to execute and deliver, and the licensor shall thereupon also execute and deliver a new contract having the same terms and conditions as are contained herein.

ARTICLE XVII.

Previous agreement superseded.—This agreement shall supersede the said agreement of November 16, 1917, between the licensor and the licensee.

In witness whereof, the parties hereto have caused this contract to be executed in triplicate, at Washington, D. C., the day and year first above written.

AMERICAN CYANAMID COMPANY,
Licensor.

By _____,
President.

Attest:

Secretary.
UNITED STATES OF AMERICA,
By _____,
Colonel, Ordnance Dept., N. A., Contracting Officer.

SCHEDULE A.

[Being a part of license agreement hereto annexed.]

LIST OF PATENTS COVERING PROCESSES AND PRODUCTS OF THE PROPOSED GOVERNMENT NITRATE PLANTS.

- U. S. Patent 776314. "Process of Making Ammonia," November 29, 1904.
- U. S. Patent 785161. "Process of Making Nitrogen Compounds," March 21, 1905.
- U. S. Patent 12762. "Process of Making Nitrogen Compounds," March 10, 1908.
- U. S. Patent 996011. "Method of Making Nitrogen Compounds," June 20, 1911.
- U. S. Patent 999071. "Apparatus for Producing Calcium Cyanamid," July 25, 1911.
- U. S. Patent 1009705. "Process of Making Calcium Cyanamid," November 21, 1911.
- U. S. Patent 987674. "Process of Producing Nitrogen Compounds," March 21, 1911.
- U. S. Patent 1006927. "Method of Producing Nitrogen Compounds from Carbids," October 24, 1911.
- U. S. Patent 1010404. "Apparatus for Producing Nitrogen Compounds from Carbids," November 28, 1911.
- U. S. Patent 1100582. "Process of Crushing and Grinding Calcium Carbide," June 16, 1914.
- U. S. Patent 1100539. "Cyclical Process of Fixing Atmospheric Nitrogen," June 16, 1914.
- U. S. Patent 1103060. "Method and Means for Fixing Nitrogen," July 14, 1914.
- U. S. Patent 1103061. "Process and Apparatus for Fixing Atmospheric Nitrogen," July 14, 1914.
- U. S. Patent 1103062. "Method of and Apparatus for Fixing Nitrogen," July 14, 1914.
- U. S. Patent 1149653. "Process of Making Ammonia from Calcium Cyanamid," August 10, 1915.
- U. S. Patent 1183885. "Apparatus for Producing Ammonia," May 23, 1916.
- U. S. Patent 1154640. "Process of Producing Ammonia," September 28, 1915.
- U. S. Patent 1163095. "Process of Making Ammonia from Calcium Cyanamid," December 7, 1915.
- U. S. Patent 1242953. "Process for Producing Nitrore Gases," October 16, 1917.
- U. S. Patent 1193796. "Method of Oxidizing Ammonia," August 8, 1916.

U. S. Patent 1193797. "Process of and Apparatus for Oxidizing Ammonia," August 8, 1916.

U. S. Patent 1193798. "Catalyzer Apparatus for Oxidizing Ammonia," August 8, 1916.

U. S. Patent 1193799. "Platinum Catalyzer," August 8, 1916.

U. S. Patent 1193800. "Catalyzer for Oxidizing Ammonia," August 8, 1916.

U. S. Patent 1206062. "Process of Making Nitric Acid and other Products," November 28, 1916.

U. S. Patent 1217247. "Process of Making Ammonia Nitrate and other Products," February 27, 1917.

U. S. Patent 1206063. "Process of Making Nitric Acid and other Products," November 28, 1916.

SCHEDULE B.

[Being a part of license agreement hereto annexed.]

U. S. Patent 776314. "Process of Making Ammonia," November 29, 1904.
U. S. Patent 735161. "Process of Making Nitrogen Compounds," March 21, 1905.

U. S. Reissue 12762. "Process of Making Nitrogen Compounds," March 10, 1908.

U. S. Patent 996011. "Method of Making Nitrogen Compounds," June 20, 1911.

U. S. Patent 999071. "Apparatus for Producing Calcium Cyanamid," July 25, 1911.

U. S. Patent 1009705. "Process of Making Calcium Cyanamid," November 21, 1911.

U. S. Patent 987674. "Process of Producing Nitrogen Compounds," March 21, 1911.

U. S. Patent 1006927. "Method of Producing Nitrogen Compounds from Carbid," October 24, 1911.

U. S. Patent 1010404. "Apparatus for Producing Nitrogen Compounds from Carbid," November 28, 1911.

U. S. Patent 1100582. "Process of Crushing and Grinding Calcium Carbide," June 16, 1914.

U. S. Patent 1100539. "Cyclical Process of Fixing Atmospheric Nitrogen," June 16, 1914.

U. S. Patent 1103060. "Method and Means for Fixing Nitrogen," July 14, 1914.

U. S. Patent 1103061. "Process and Apparatus for Fixing Atmospheric Nitrogen," July 14, 1914.

U. S. Patent 1103062. "Method of and Apparatus for Fixing Nitrogen," July 14, 1914.

U. S. Patent 1149653. "Process of Making Ammonia from Calcium Cyanamid," August 10, 1915.

U. S. Patent 1183885. "Apparatus for Producing Ammonia," May 23, 1916.

U. S. Patent 1154640. "Process of Producing Ammonia," September 28, 1915.

U. S. Patent 1163095. "Process of Making Ammonia from Calcium Cyanamid," December 7, 1915.

Major BURNS. There is also a proviso in the contract with reference to sale of the plant which is quite pertinent and which I think should be read.

The CHAIRMAN. What about that? Has the Government tied itself up so we could not sell the property?

Major BURNS. I will read you the proviso, Senator.

The CHAIRMAN. All right; read it.

Major BURNS. It is article 19, "Sale of plants."

"If upon cessation of this war, or for any other reason, the United States determines to cease the construction, equipment, or operation of any of the said plants and to dispose of the same, the agent shall be given the first opportunity (for a reasonable period of time, not to exceed six months after receipt of written notice stating the determination of the United States to dispose of the same, and the material terms upon which such disposition shall be made) to purchase the same upon as favorable terms as the United States is willing to accept therefor, before the United States shall sell the same to any other party."

In other words, if the Government determines to sell this plant it must state to the Air Nitrate Corporation the price at which they are willing to sell it, and the Air Nitrate Corporation has the option of purchasing it within six months at that price.

Senator HEFLIN. Is the American Cyanamid Co. a foreign corporation?

Major BURNS. No; it is an American corporation.

Senator HEFLIN. I mean it is owned by foreign stock; the stockholders are principally foreigners?

Major BURNS. I don't think so. It is called the American Cyanamid Co., and I think the great bulk of its stock is owned in America. It does, however, run a plant in Niagara Falls, Canada.

Senator KENDRICK. I was just going to ask is it not a Canadian-owned corporation?

Major BURNS. Not to my knowledge, Senator. I think it is essentially an American-owned corporation.

Senator HEFLIN. I have seen the statement to that effect—that it is owned principally by people who are not Americans.

Major BURNS. Well, I will check up on that and give the data that I can for the record.

Senator HEFLIN. I wish you would.

(This point was covered in the hearings before the Senate Committee on Agriculture and Forestry, 66th Cong., 2d sess., on bill S. 3390, p. 238, when the following questions and answers were made:)

"The CHAIRMAN. Some of the stock of the American Cyanamid Co., as I understand it, is owned by foreign capital?

"Mr. WASHBURN. Yes.

"The CHAIRMAN. Is the majority of the stock owned by American citizens?

"Mr. WASHBURN. Oh, yes; about 70 per cent—well, more than 70. We will say 75 per cent is owned here and 25 per cent abroad."

Major BURNS. I might say that the question of the legality of this article of the contract with the Air Nitrates Corporation has been passed upon by the Judge Advocate General of the Army, and he claims that it is null and void.

The CHAIRMAN. Yes; but does that apply, that judgment of the Judge Advocate, to that one article or to the whole contract?

Major BURNS. Just to that one article, sir.

The CHAIRMAN. The contract outside of that is legal?

Major BURNS. We did not ask him for an opinion upon the legality of the entire contract. We only asked him for an opinion on this article, and he said it is null and void.

Senator KENDRICK. Major, is not that a very liberal contract compared to what the American Cyanamid Co. asked from the Government when they first proposed to give them the use of their organization and the opportunity to use their patents?

Major BURNS. Do you mean is this a more liberal contract than they originally asked for?

Senator KENDRICK. Yes. My recollection is that their proposition to the Government was that they would furnish them the use of their organization, the Government paying all of the expenses, for a million dollars a year, and \$5 a ton royalty on the amount of product, and the final delivery to the American Cyanamid Co. of the entire plant when the war ended, in fee simple.

Major BURNS. Of course this contract was the subject of considerable negotiation between the officers and special representatives of the Government and the American Cyanamid Co.

Senator KENDRICK. I think that is a matter of record. I think that their proposition, that I have stated, is a matter of record.

The CHAIRMAN. There was no such contract, Senator, was there?

Senator KENDRICK. No; but then it was their original proposition to the Government.

The CHAIRMAN. Well, that was very liberal of them, if they didn't include the Capital of the United States to be turned over to them.

Senator KENDRICK. Well, I asked the witness if that proposition were made in a spirit of patriotism to help out in the war?

The CHAIRMAN. I suppose it was.

Senator HEFLIN. And then at the end of the war to take it back so that we would not have any way to provide ourselves with nitrates in case of another war?

The CHAIRMAN. We could buy it. We could tax ourselves to give them some more money to do that in the next war, all right. But the contract, Senator, says that we ought to give them the whole thing. It does not relinquish anything.

Senator HEFLIN. What inducement, if anything, Major, did they offer to the Government in order to sign a contract like that?

Major BURNS. Of course it was their knowledge and organization that permitted of the construction of this plant. Without them we could have done nothing. We had no knowledge of our own.

The CHAIRMAN. Of course it was the Government's patent, however, that gave them everything that they had. If it had not been for the patent they received from the Government, giving them a monopoly on this business, they would not have had anything either.

Major BURNS. There is no doubt but what the Government patent protected their business.

The CHAIRMAN. Yes; and that was used in the next round to take advantage of the Government. The Government, though, gave this patent that enabled them in turn to hold up the Government, if they are held up.

Major BURNS. I do not know as to the fairness of the contract.

I feel, though, that I should say this with reference to the prime contractor, or Air Nitrate Corporation, in my judgment they did an excellent job. I think they turned out a plant that is a credit to themselves and to America, aside from the compensation which they received for it.

The CHAIRMAN. Well, they were paid for it, were they not?

Major BURNS. Yes, sir.

The CHAIRMAN. How much were they paid?

Major BURNS. They would have received, in accordance with their contract for the construction of nitrate plant No. 2 and the two other cyanamid plants which were started during the war, nitrate plants Nos. 3 and 4, a fee of \$1,500,000, but the Government has never paid them but approximately \$1,150,000. The Government has held up the balance of the fee because the director—

The CHAIRMAN. The fee was just a bonus that the Government paid for the plant outside of that, did it not?

Major BURNS. The Government paid all the expenses and would have given the company, if the contract had been carried out as written, a fee, as profit to the company for the work it did, of \$1,500,000.

Senator HEFLIN. Why did the Government stop paying that?

Major BURNS. Because the director of construction of nitrate plants, Mr. Cranford, who was placed in charge of the work by the Government, thought that a fee of \$1,150,000 was all that the work was worth, and he refused to pay the balance.

The CHAIRMAN. Now, Major, this contract, as I understand it, provides that the contractor shall be paid a royalty?

Major BURNS. That is correct.

The CHAIRMAN. If the Government makes anything it will pay \$12 a ton for everything it makes there?

Major BURNS. \$12 per ton in time of war, and \$30 in time of peace.

The CHAIRMAN. So that their fee consists not only in a royalty, but it consists in a continued royalty as long as these plants are operated by the Government?

Major BURNS. Yes, sir. For the life of the patents.

The CHAIRMAN. And is not that price going to be prohibitive and really prevent the Government from making a fertilizer at a price that the farmer can afford to buy it for?

Major BURNS. No, sir; I do not think so, for the reason that there is a clause in the license agreement which allows either party to have the question of royalties submitted to a board of arbitration in order to determine the fairness of the royalty; and, in my judgment, that board of arbitration would determine upon a fair royalty and one that would allow the plant to live if it had a chance, under normal economic conditions.

Senator KENDRICK. Major, as I understand your statement about the character of the plant when it is finished, it represents a very different proposition from the Haber process?

Major BURNS. Yes, sir; it is entirely different.

Senator KENDRICK. In fact, this plant when completed would give efficient service, while the other one was completed in so far as every appearance went, and it would not produce?

Major BURNS. That is correct.

The CHAIRMAN. The American Cyanamid Co. had nothing to do with the Haber process?

Major BURNS. No, sir.

The CHAIRMAN. That is an entirely different thing?

Major BURNS. Yes, sir.

The CHAIRMAN. You are not handicapped in that plant, if you can make it work, by having to pay a royalty or giving them anything.

Major BURNS. Yes, sir. We have a royalty on the process of plant No. 1 with the General Chemical Co.

The CHAIRMAN. How did that happen to get in there?

Major BURNS. Because it was their process that the Government adopted.

The CHAIRMAN. But the process adopted did not work and never has worked.

Major BURNS. It did not work; no, sir. As to whether that royalty agreement would be binding, I don't know.

The CHAIRMAN. Is there an agreement with the General Chemical Co.?

Major BURNS. Yes, sir.

The CHAIRMAN. That in that other plant we are going to pay them a royalty, too?

Major BURNS. Yes, sir.

The CHAIRMAN. For making fertilizer?

Major BURNS. Yes, sir.

Senator KENDRICK. Senator Norris, that is exactly what I was bringing out a moment ago, that one operates successfully and the other does not. Whether they would be entitled to a royalty—

The CHAIRMAN. In both cases the Government did it all. They didn't do anything.

Senator HEFLIN. The Government furnished all the money?

The CHAIRMAN. Yes.

Senator KENDRICK. Yes; but I take it that each company, the owner of each one of these processes, supervised the building of the plants.

The CHAIRMAN. Yes; and got paid for it. They have not any more claim on it than the carpenter who ran a plane that planed off the doors.

Senator KENDRICK. I understand that fully, but one company furnished a process that worked, and the other one furnished a process that did not work. Is not that true?

Major BURNS. That is correct; yes, sir.

Senator HEFLIN. Now, then, Major, under that contract the Government is compelled to permit this American Cyanamid Co. to have the first opportunity to buy this whole proposition down there?

Major BURNS. That is the intent of the contract; yes, sir.

The CHAIRMAN. That is the Cyanamid Co., Senator.

Major BURNS. Yes, sir; that is No. 2 plant.

Senator HEFLIN. Now, if somebody else buys this plant they have got to pay royalties to the American Cyanamid Co. on their product turned out there until 1931?

Major BURNS. Yes, sir; that is correct; and they would have to pay the stipulated royalties in the contract or have the royalty matter submitted to the board of arbitration and an adjustment secured.

Senator HEFLIN. Has not the Judge Advocate General of the Army rendered some opinion on this case in which he says that that contract is not binding on the Government?

Major BURNS. Not to my knowledge. He has never rendered an opinion to the effect that the whole contract is not binding. He has rendered a decision to the effect that the article which I read which pertains to the option to purchase is not binding on the Government.

Senator HEFLIN. That feature of it?

Major BURNS. Yes, sir. He claims that the Government has a right to sell this plant to anybody that it sees fit to sell it to.

Senator KENDRICK. Major, you stated a moment ago, as I understood you, that the Government would also be required to pay a royalty to the Haber people; that is, to the General Chemical Co.?

Major BURNS. The General Chemical Co.; yes, sir.

Senator KENDRICK. The General Chemical Co. Do you recall what the amount of that royalty is?

Major BURNS. Yes, sir; it is \$5 per ton of fixed nitrogen.

Senator KENDRICK. The other was \$12?

Major BURNS. Yes, sir.

The CHAIRMAN. What is that provision in the contract?

Major BURNS. I will read that clause. Perhaps that will be the best answer to the question.

The CHAIRMAN. All right.

Major BURNS (reading):

"In so far as the Government shall see fit to employ said processes or apparatus or any of them in the manufacture of products to be used exclusively for munitions of war, no compensation by way of royalty or otherwise will be asked or received by the General Chemical Co.

"In so far as the Government shall see fit to employ the said processes or apparatus or any of them, in the manufacture of products to be used for fertilizers, the Government shall pay to the General Chemical Co. a royalty for such use. The royalty so to be paid shall be based upon the nitrogen content of the material produced for fertilizer purposes and shall be at the rate of \$5 for each ton of 2,000 pounds of fixed nitrogen in whatever form combined, and shall be payable quarterly until the 9th day of November, 1932, and thereafter until the expiration of all patents involving any substantial feature of the process or apparatus."

Now, I stated that we had to pay a royalty to the General Chemical Co. in time of war for munition purposes. I see that is incorrect. We have only to pay to the General Chemical Co. when we manufacture for fertilizer purposes.

The CHAIRMAN. The General Chemical Co. had some patent, I suppose?

Major BURNS. Yes, sir; they had a patent on this Haber process, or a modification of the Haber process.

The CHAIRMAN. The Government undertook to put that in under their supervision, didn't they?

Major BURNS. Yes, sir.

The CHAIRMAN. And when they got it in it didn't work?

Major BURNS. Yes, sir; that is correct.

The CHAIRMAN. And the Government had agreed to pay, as you have read there, a royalty on everything it manufactured?

Major BURNS. Yes, sir; for fertilizer purposes.

The CHAIRMAN. Now, then has the question been raised as to whether or not this General Chemical Co., having offered to the Government its plan to manufacture fertilizer, and it having been ascertained that the Government, after spending about \$13,000,000, discovered that it is a failure and a fake—has there been any claim made by the Government against the General Chemical Co. for damages?

Major BURNS. No, sir; but I think that—

The CHAIRMAN (Interposing). Is there any such thing contemplated?

Major BURNS. No, sir. I would like to point this out, Senator; that this Haber process that was installed at nitrate plant No. 1 was really the pilot endeavor in America, and I think it would have been too much to expect the plant to work satisfactorily in the first effort. The General Chemical Co. has, in combination with the Semet-Solvay Co., at Syracuse, put in the process which they had patented, and it is now working satisfactorily.

The CHAIRMAN. Why didn't they put it in down there?

Major BURNS. I think they did the very best they could, Senator; but they didn't have enough knowledge at that time to make a satisfactory plant.

The CHAIRMAN. In other words, if they represented to the Government that they did have, and that that company would put it in, and having put it in, that it was going to work, why are they not liable to the Government for damages if it didn't work?

Major BURNS. I think the General Chemical Co.'s efforts in the construction of this plant were excellent. They had something which they thought would help the Government, and they offered it to the Government.

Senator MCKINLEY. Was it necessary for them to spend \$13,000,000 to find out that it was a failure?

The CHAIRMAN. They were going to offer it to the Government, but they got paid for it?

Major BURNS. Of course, the \$5 per ton of fixed nitrogen as royalty is only a nominal sum.

The CHAIRMAN. Is it small?

Major BURNS. Yes, it is small. They asked nothing for the product when used for munitions purposes, and only \$5 per ton of nitrogen for fertilizer, and even in that instance it is nominal. The General Chemical Co. was not responsible for the expenditure of \$13,000,000 at the No. 1 plant. Approximately half of it went into their processes. The other half went into a plant for the conversion of the ammonia into other forms and finally into high explosives.

Senator McKINLEY. Well, then, is that part still valuable?

Major BURNS. The part that converts the ammonia into nitric acid and ammonia nitrate is thoroughly satisfactory, but, of course, it is of no use as a fertilizer proposition. It is only good from a munitions standpoint.

Senator McKINLEY. It is good for war?

Major BURNS. Yes, sir.

Senator McKINLEY. Then, the Government ought not sell it, ought they?

Major BURNS. They ought not to sell it unless they can meet the demands for explosives in some other way. It is my judgment that they can meet their demands for explosives in some other way and it would therefore be an undue expenditure of Government money to keep that plant in stand-by condition for years. Of course, if the plant were going to be operated you would have a different problem to solve.

Senator McKINLEY. As long as we have it, how much would you suggest that it would cost to keep it in stand-by, since we have \$6,000,000 invested in it?

Major BURNS. It is costing us today, in round figures, about \$40,000 a year to keep the No. 1 plant.

Senator McKINLEY. But that is both parts of it?

Major BURNS. Yes, sir; all of the plant.

Senator McKINLEY. How much would it cost to keep this \$6,000,000 that is good for war purposes?

Major BURNS. I should say it would cost about half that.

Senator McKINLEY. \$20,000 a year?

Major BURNS. Yes, sir. With reference to the General Chemical Co., Senator, I believe that their attitude in this whole matter has been very fair. I think they honestly gave the Government everything they had to give and that they did not charge an undue price for their service.

Senator HEFLIN. But did they not tell the Government that this thing would be a success?

Major BURNS. No, sir. They made no guarantees to the Government. The Government needed help, and they went to the General Chemical Co., and the General Chemical Co., as I say, gave the Government all the help that it could. We were struggling to solve the problem. We had to get knowledge where we could get it, and they gave it to us as best they could.

The CHAIRMAN. Assuming all that to be true, if the Government needed help, as you say, and went to the General Chemical Co., and the General Chemical Co. said, "We have a process here now; you pay the expense of putting it in and then you pay us a royalty," and the Government did pay; they didn't pay anything. The General Chemical Co. did not put up a dollar. The Government did it all.

Major BURNS. That is correct.

The CHAIRMAN. And when they got through they expended all that money and found the thing was not any good; it would not work. There is a big difference between a company or a man saying to another man, "I will put in your machinery here; I have got a thing that will work, and I will put in this machinery, and you pay all the expense, and then you pay me a royalty"—there is a big difference between his doing that and doing the other thing, by saying, "You can have it; use it as you please, and I will help you all I can without pay." There is a consideration in one case and there is not in the other. There is liability for damages in the one case and there is not in the other. If they went into it to get money out of it and made representations, "Here, we have a thing that will produce so-and-so," and the Government spent its money on that kind of a promise to find out that it would not produce it—

Senator HEFLIN. In other words, the statement of the General Chemical Co. caused the Government to expend this money?

Senator McKINLEY. \$13,000,000.

The CHAIRMAN. If the General Chemical Co. was giving it to the Government, and was getting nothing out of it itself, that would be one thing; but if they were making that proposition with a view of getting a royalty for themselves that is another thing. That is an entirely different legal proposition.

Major BURNS. Yes; it would be, as I see it; but the General Chemical Co. never expected to get any appreciable amount of money out of the plant that they erected at Muscle Shoals.

The CHAIRMAN. That may be true, and I think probably this discussion is not material.

Senator MCKINLEY. Let me ask one question: Why didn't they use the Haber process?

Major BURNS. The first plant constructed was a modification of the Haber process.

Senator MCKINLEY. Why didn't they use it? They modified machine guns and artillery and airplanes and everything else.

Major BURNS. I think that is a very pertinent inquiry. I think it would have been much better if they had used the Haber process, but unfortunately they didn't know the Haber process. The best information was with reference to the General Chemical Co.'s process, which was a modification of the Haber process. So they really went as close to the Haber process as they could.

The CHAIRMAN. I saw a contract or a letter of some kind that the employees or chemists of the United States, when they were putting in this process, if any new discovery was made, even by the Government chemists, it would inure to the benefit of the General Chemical Co., and they would turn it over to them, and it would be patented for their benefit.

Major BURNS. Yes, sir. I think you are absolutely correct with reference to Nitrate Plant No. 1. When you asked that question before it was with reference to Nitrate Plant No. 2.

The CHAIRMAN. Is that in this contract?

Major BURNS. There was an agreement by which patents of the General Chemical Co. would be very completely protected.

The CHAIRMAN. Was there not an agreement that if they discovered an improvement, even though it was discovered by a Government chemist, it would inure to the benefit of the General Chemical Co. and be patented in their name?

Major BURNS. I think you are correct, Senator. I will read the clause in the agreement, though: "If this tender shall be accepted, the General Chemical Co. hereby undertakes forthwith to communicate with the designated experts for the Government all of its knowledge and discoveries pertaining to the said processes and apparatus, whether or not the same shall be the subject of patents, and from time to time thereafter, so long as the Government shall continue the use of said processes, to communicate all further improvements promptly as they shall come to the knowledge of the company and without further charge for the use thereof, within and subject to the limitations before expressed. And reciprocally, it is understood that all modifications and improvements in the processes or apparatus, which the Government shall discover or employ, shall be at the disposal of the General Chemical Co. and its licensees, if any, for use in its or their own works, and that all such modifications and improvements shall be freely exhibited upon request to the representatives of the General Chemical Co."

The CHAIRMAN. All right.

Senator HEFLIN. I understand from that contract, then, that the Government agreed there that if it should make any improvement, discovery, or a process that would be better than the one that they were then employing the Government could not profit by it, but should surrender its rights to the General Chemical Co.

Major BURNS. I don't think it said that, Senator.

Senator HEFLIN. That is the way I got the reading of it.

Major BURNS. If that is your judgment from the reading of it, of course that is the answer.

Senator HEFLIN. Read that line again there, where it said something about any discovery made by the Government.

Major BURNS (reading): "The General Chemical Co. hereby undertakes forthwith to communicate to the designated experts for the Government all of its knowledge and discoveries pertaining to the said processes and apparatus, whether or not the same shall be the subject of patents, and from time to time thereafter, so long as the Government shall continue the use of said processes, to communicate all further improvements promptly as they shall come to the knowledge of the company, and without further charge for the use thereof, within and subject to the limitations before expressed. And, reciprocally, it is understood that all modifications and improvements in the processes or apparatus which the Government shall discover or employ"—

Senator HEFLIN. There it is.

Major BURNS (continuing reading): "Shall be at the disposal of the General Chemical Co. and its licensees, if any, for use in its or their own works, and that all such modifications and improvements shall be freely exhibited upon request to the representatives of the General Chemical Co."

In other words, they agreed to give us the benefit of all knowledge which they developed and we in turn agreed to give them the benefit of all knowledge which we developed.

Senator HEFLIN. Do you understand by that that we can make an improvement on their process and ask to have it patented, and we could get it and operate it independently of them?

Major BURNS. That is with reference to future action. The Judge Advocate General has held that this contract, in so far as it relates to new developments, is ended, and that if the Government at the present time develops any new thing in the matter of fixation of nitrogen it does not have to give it to the General Chemical Co., and, reciprocally, we are not entitled to anything developed by the General Chemical Co.

The CHAIRMAN. Do you know, Major, whether at this plant, while this partnership existed, any new discoveries were made with reference to anything connected with this business?

Major BURNS. I think, without doubt, there was a good deal of development as a result of this work.

The CHAIRMAN. Do you know whether they were patented?

Major BURNS. No, sir, I don't; but all sides naturally learned a lot from their attempted operation of this plant, and I think that this experience was of the greatest benefit to the General Chemical Co., because it has been able to apply the knowledge which it gained from construction and operation of this plant at Sheffield to the plant at Syracuse. I believe the Syracuse plant would not have been the success it has been without the experience at Sheffield.

The CHAIRMAN. Yes. That is very probable. In other words, if the General Chemical Co. had started out to build its plant at Syracuse without the experience it had down there it would have made a failure at Syracuse like it made for the Government?

Major BURNS. It would have had to go through its teething troubles, so to speak.

The CHAIRMAN. So at least they had the advantage of the Government paying for the development?

Major BURNS. In my judgment that was of very substantial assistance to them.

The CHAIRMAN. That would be of very substantial value to them?

Senator HEFLIN. If discovery had been made and patent had been asked and granted on a process that was an improvement on or addition to the process that we got from the General Chemical Co., what authority or ownership over that would the Chemical Co. have and exercise?

Major BURNS. As I read this agreement, the Government would have the right to patent the idea, but it would have to allow the General Chemical Co. or any of its licensees to use that patent free of charge.

The CHAIRMAN. Well, that would mean everybody, would it not? On the face of it, it would be very reasonable, it seems to me, to allow them that privilege. In other words, give them the same right that the Government secured from them from their partnership in this business: If the Government discovered anything new, let the Chemical Co. use it; but if we allow the Chemical Co. not only to use it but to give its licensees the right to use it, you give them the right to sell it to anybody on earth.

Major BURNS. Yes, sir.

Senator HEFLIN. And we are paying them for the use of their property?

Major BURNS. Yes.

The CHAIRMAN. Yes.

Major BURNS. But we are paying them only a nominal sum.

The CHAIRMAN. The Government does not get the right to assign anything to anybody else. It only works one way.

Major BURNS. That is my interpretation.

Senator HEFLIN. If a Government official should discover a process that was an improvement on this process, and we want to employ that to go ahead and turn out fertilizer, we have got to pay them a royalty still on that, although we are employing an improved process and one that was discovered and made by the Government?

Major BURNS. As I said before, in accordance with the decision of the Judge Advocate General, this contract, as far as future development of ideas is concerned, is null and void. As to whether his opinion would be upheld by the court, I don't know. But, at any rate, he thinks that this contract has stopped to act in so far as it pertains to new patentable ideas or new developments or anything of the kind. He does not hold, however, that we would be relieved from paying royalty for use of the patented process of the General Chemical Co.

Senator HARRISON. You said that a royalty of \$5 a ton is nominal. What is the capacity of the plant? What is it proposed to make, and about how much would it amount to per year?

Major BURNS. It would have fixed about 8,000 tons of nitrogen per year, and that in turn would, on the basis of \$5 per ton, amount to \$40,000 per year to the General Chemical Co.

Senator MCKINLEY. I wanted to ask a question, but I don't want to interfere with the continuity of your statement.

Major BURNS. I was going on to describe the situation at Gorgas.

Senator MCKINLEY. I wanted to just definitely get in something about this cost at plant No. 2.

Now, I suppose that the only way that the layman has to get an idea of cost is in comparison with Chilean nitrate?

Major BURNS. Yes, sir.

Senator MCKINLEY. Which I understand is about \$60 per ton now?

Major BURNS. No, sir; it is lower than that now. It is somewhere between \$45 and \$50 per ton.

Senator MCKINLEY. Well, we will say \$50 per ton. Now, in order to create a fertilizer which will act in the general way on soil the same as the Chilean nitrate, about what would you have to create by way of power—per horsepower—in order to compete at \$50 a ton?

Major BURNS. In my judgment, the No. 2 nitrate plant can not be operated so that it can compete with Chilean nitrate sold at \$50 a ton unless you get power at less than 1 mill per kilowatt hour, and even then the margin would be very slight.

Senator MCKINLEY. Well, now, Colonel Barden says that that plant, figuring 4 per cent interest, 5 per cent depreciation—I think he says so here in his testimony—5 per cent operation, depreciation, and so on, and 4 per cent interest, would make the power cost 3.08 mills per kilowatt hour. That would be 5 mills per kilowatt—

The CHAIRMAN (interposing). Per horsepower?

Senator MCKINLEY. No; it is the other way. It would be 3 mills per horsepower.

Major BURNS. A little less than the price per kilowatt; yes, sir.

Senator MCKINLEY. That would be 3 mills. Now, if you have to have it at three-quarters of a mill—

The CHAIRMAN (interposing). He says a mill.

Major BURNS. Less than a mill.

The CHAIRMAN. Less than a mill; yes.

Senator MCKINLEY. Yes, or even a mill. If you have to have it as low as a mill, then this costs three times as much for power as you would have to compete at all with the Chilean nitrate?

Major BURNS. Yes, sir. In my judgment the cyanamid plant at Muscle Shoals, unless some new development comes along that we can not at present foresee, can not enter the commercial market with power in excess of one mill.

Senator MCKINLEY. But the figures are in excess of three mills.

Major BURNS. At 3 mills I do not think it could compete in the commercial market at all.

The CHAIRMAN. That is the cyanamid process?

Major BURNS. Yes, sir.

The CHAIRMAN. What about the Haber process?

Major BURNS. As I stated yesterday, the consumption of power in the Haber process, provided you get your gas from coke, is so relatively small, that the cost of power does not have any appreciable effect upon the cost of the product.

The CHAIRMAN. Let us take into consideration, now, everything that you have down there. Assuming that the process down there, by the expenditure of \$5,000,000 more money, can be made to work successfully, can that plant be operated so as to compete with Chilean nitrates at \$50 a ton?

Major BURNS. In my judgment, it can; yes, sir.

The CHAIRMAN. The Haber process?

Major BURNS. Yes, sir; I think the Haber process has sufficient possibilities to do that.

Senator McKINLEY. But the power has nothing to do with it?

Major BURNS. No, sir; it is not the determining factor.

Senator McKINLEY. That is, you could go any place where you have coal?

Senator NORBECK. That plant can not be operated successfully that far from the source of the fuel supply where it is now operated?

Major BURNS. I believe that plant could be operated successfully at Sheffield.

Senator HARRISON. What has been the average price of Chilean nitrate. Have you got it there?

Major BURNS. Yes, sir.

Senator HARRISON. What was the peak during the war?

Major BURNS. The peak during the war was about \$100 per ton.

Senator HARRISON. What is the cheapest it has been during the last five years?

Major BURNS. I think it has been down to a little below \$40.

Senator HARRISON. You think that the present price of \$50 per ton is about the average price?

Major BURNS. My judgment would be that the price of nitrate of soda will probably fluctuate between \$40 and \$60, unless some emergency comes along when the price would be much higher. On the other hand if it should happen that farmers would not be able to buy fertilizer the prices would likely go lower. I have a chart here showing the average costs of Chilean nitrate over a period of years.

Price per short ton of nitrate of soda.

Year.	High.	Low.	Average.	Year.	High.	Low.	Average.
1907.....	\$51.00	\$47.00	\$49.00	1915.....	\$58.00	\$38.00	\$48.00
1908.....	48.00	43.00	45.00	1916.....	71.00	58.00	64.00
1909.....	44.00	42.00	43.00	1917.....	94.00	63.00	80.00
1910.....	43.00	42.00	42.50	1918.....	103.00	86.00	95.00
1911.....	45.00	42.00	43.00	1919.....	88.00	58.00	73.00
1912.....	52.00	44.00	48.00	1920.....	78.00	56.00	72.00
1913.....	53.00	44.00	50.00	1921.....	58.00	40.00	50.00
1914.....	45.00	38.00	42.00				

Senator NORBECK. I am not sure, Major, that I understood you. I would like to ask one more question. I think you said that if certain materials were available the Haber process could enter into competition, because the amount expended for power was low. What are the other requirements, the more expensive requirements for that process, outside of power?

Major BURNS. Coke is the principal material, and some special chemicals in small tonnage quantities are also required.

Senator NORBECK. Would the location be favorable from the standpoint of coke?

Major BURNS. Reasonably so; yes, sir. You can get coke quite easily from Birmingham.

Senator NORBECK. Would the location at Birmingham be very much more favorable for that process?

Major BURNS. I think the location at Birmingham would be slightly more favorable than Sheffield; yes, sir. It should be remembered, however, that while power does not play any great part in the Haber process, cheaper power will certainly help the Haber process.

Senator NORBECK. I was wondering to what extent the shipment of coke would enter into the cost of it; whether that was a large factor or a smaller one.

Major BURNS. I don't think it would be very large.

The CHAIRMAN. The power at Sheffield would be a little less expensive than it would at Birmingham, wouldn't it?

Major BURNS. Yes, sir; it might be.

The CHAIRMAN. Where it is now located?

Major BURNS. In other words, I don't want to say that you ought not to use the very cheapest power you possibly can, because of course the cheaper you can get any of your materials the cheaper the final product is going to be.

The CHAIRMAN. Certainly. Now, coke seems to be one of the important items of expense.

Major BURNS. Yes, sir.

The CHAIRMAN. If you got your coke from Birmingham, it would be shipped over the railroad to Sheffield?

Major BURNS. Yes, sir.

The CHAIRMAN. When these dams are completed would the navigation on the Tennessee River help out any on the supply of coke that is shipped in? Is there any place along the Tennessee River where coke would be made and shipped by water to Sheffield?

Major BURNS. I know of none, sir.

Colonel BARDEN. There are large coal fields in the upper Tennessee Valley; coal mines right on the river below Chattanooga. I don't know of any coke ovens, but there is coal there.

The CHAIRMAN. Do you know whether it is coking coal?

Colonel BARDEN. No; I do not; but there is a large quantity of coal.

Senator McKINLEY. Major, it would be perfectly feasible to build the Haber plant, if you have got to build a new one, at Birmingham, and take that power over by wire from Muscle Shoals, wouldn't it?

Major BURNS. Yes, sir.

The CHAIRMAN. Suppose instead of building it at Birmingham you built it at Gorgas and used the transmission line that we already have, that we now own, from Gorgas over to Muscle Shoals. That would be cheaper still, would it not, than to go to Birmingham? You get coke from Gorgas?

Major BURNS. Well, you could by putting in a coke oven. Of course, they have lots of coal there.

The CHAIRMAN. Yes. There is nothing but coal around Gorgas.

Major BURNS. Yes, sir. You could put in coke ovens, of course.

Senator McKINLEY. I suppose the coke ovens are already at Birmingham, are they?

Major BURNS. Yes, sir. They make a great deal of coke at Birmingham.

The CHAIRMAN. You could put in your coke oven and get your coal and coke there cheaper than you could at Birmingham, and build your plant over there, if you wanted to use water power, use the transmission that you now have, instead of taking it from Gorgas over to Birmingham. I think your power there at Gorgas would be the cheapest that could be obtained, from coal right at the mouth of the coal mine.

Major BURNS. Yes, sir. It is pretty hard to beat the Gorgas steam power plant from a coal-supply point of view.

The CHAIRMAN. Taking it all in all, would it not pay the Government, if it were going to put in the Haber process, to go to Gorgas and build it there, where you would have cheap coal and cheap coke, so you would have cheap power and coke both?

Major BURNS. There are so many factors that enter into the situation that it would be very hard to answer. You have got to look at the labor market, as well as the other items. There is no doubt but that the labor market is more limited at Gorgas than at Birmingham.

The CHAIRMAN. The labor item is not of very much importance in the Haber process, is it?

Major BURNS. No, sir; the labor in the Haber process is not great in amount, but it has got to be quite skilled, because it is a complicated chemical process, and you need good mechanics.

The CHAIRMAN. You would not need so very many men, though?

Major BURNS. It would all depend on the size of the plant you are going to install.

The CHAIRMAN. Of course, if we knew it was going to be a success we would build a larger plant than you built there at Sheffield. That was, to some extent, an experimental plant?

Major BURNS. Yes, sir; that is not a real large producer.

Senator McKINLEY. What is the percentage of production of fertilizer at that plant as compared with the cyanamid plant?

Major BURNS. That is one-fifth as large as the cyanamid plant. The No. 2 plant is able to fix about 40,000 tons of nitrogen a year. The by-product coke ovens are producing to-day about 100,000 tons of inorganic nitrogen per year, and we are importing, in round figures, from Chile 100,000 tons of nitrogen per year. So the No. 2 plant represents about 20 per cent of all the inorganic nitro-

gen that is being used in the United States to-day. Now, the No. 1 plant would similarly be one-fifth of 20 per cent, or about 4 per cent of the consumption of inorganic nitrogen in the United States at the present time.

The CHAIRMAN. I get those plants somewhat mixed. No. 1 plant is the Haber process?

Major BURNS. Yes, sir.

The CHAIRMAN. Now, let us get that again. It seems to me that is quite important. Compare the output of those two plants with the amount of the product used in the United States.

Major BURNS. Yes, sir; at the present time the by-product ovens are producing about 100,000 tons of inorganic nitrogen per year. We are importing from Chile about 100,000 tons of inorganic nitrogen per year. In other words, the consumption of inorganic nitrogen in the United States at the present time is approximately 200,000 tons per year.

The cyanamid plant at Muscle Shoals, or nitrate plant No. 2, is capable of producing approximately 40,000 tons of nitrogen per year, or it represents about 20 per cent of the entire consumption of inorganic nitrogen in the United States. Similarly the United States nitrate plant No. 1, the Haber plant, located at Sheffield, could produce about 8,000 tons of inorganic nitrogen per year, or it is equal to about 4 per cent of the total inorganic nitrogen consumed in the United States.

Senator HEFLIN. All that could be used for manufacturing purposes?

Major BURNS. Yes, sir.

Senator HEFLIN. About how many tons of fertilizer would that make? Can you tell us?

Major BURNS. Yes, sir. The ordinary fertilizer contains approximately 2 per cent of nitrogen. So that if you multiply those figures by 50 you will get the tonnage of fertilizer that could be supplied with nitrogen. The No. 2 plant, therefore, would have a total fertilizer equivalent of 50 times 40,000, or 2,000,000 tons of fertilizer. Similarly, the No. 1 plant would have an equivalent of 50 times 8,000, or 400,000 tons of fertilizer.

Senator McKINNEY. How many tons do you put on an acre to fertilize?

Major BURNS. I don't know, sir; but there are being used in the United States to-day approximately 7,000,000 tons of fertilizer per year.

The CHAIRMAN. The amount they put on the acre depends, I suppose, on the nature of the soil and the crop that is to be produced.

Senator McKINLEY. There is a law of averages in almost everything.

Senator HEFLIN. Sometimes they put a quarter of a ton, sometimes half a ton, and in very few instances I think they put as much as a ton.

Senator McKINLEY. According to that, then, if we can produce 800—how many tons did you say?

Major BURNS. About 7,000,000 tons.

Senator McKINLEY. No; I mean at this plant.

Major BURNS. Two million tons.

The CHAIRMAN. Two million tons at one plant and four hundred thousand tons at the other plant.

Major BURNS. It only produces the nitrogen for that amount of fertilizer.

The CHAIRMAN. I understand that; yes. There is that quantity when it becomes completed fertilizer?

Major BURNS. Yes, sir.

The CHAIRMAN. Only 2 per cent of that is nitrogen?

Major BURNS. That is correct, sir.

Senator McKINLEY. Then, on the basis of 2,000,000 tons, if we use one-half ton to the acre, that would be 4,000,000 acres?

Major BURNS. Yes, sir.

The next point that I was going to take up was the Gorgas Steam Plant, located on the Warrior River.

When the Government decided to build the cyanamid plant at Muscle Shoals its greatest worry was power. It had to have power quickly and in very large quantity. So after a good deal of study and discussion a contract was entered into with the Alabama Power Co. by which that company was to increase the plant which it had already installed at Gorgas from a 20,000-kilowatt plant to a 50,000-kilowatt plant. The plant was built at the expense of the United States by the Alabama Power Co., which company placed at the disposal of the Government its engineering and construction forces.

The No. 2 plant was started, I think, in February, 1918, and as the result of this contract with the Alabama Power Co. it had power by the 1st of June,

1918, which was of great benefit for construction purposes, as well as for starting operations.

There is a proviso in the contract with the Alabama Power Co. by which the Government is required to sell to the Alabama Power Co. this plant at a price to be fixed by a board of arbitrators, the board of arbitrators to be made up from a representative from the Government, a representative from the Alabama Power Co., and a third to be selected by the two. This Gorgas plant has been under a good deal of discussion, because it is included in the offer of Mr. Ford, and the Ordnance Department has felt constantly that it is practically impossible to live up to the Ford offer in that respect.

Senator HARRISON. What was the cost of that plant there?

Major BURNS. The power plant, with its substations, cost, in round figures, \$4,000,000.

Senator HARRISON. And what was the cost of the improvement that the Alabama Power Co. put in at the instance of the Government?

Major BURNS. That is the figure that I am giving you now. As to what their own plant cost, I don't know.

When the war started the Alabama Power Co. had installed at Gorgas the portion as shown on this map that is colored in yellow.

The CHAIRMAN. And that is true of the entire map. Is it not, Major?

Major BURNS. Yes, sir.

The CHAIRMAN. Everything that is on there in red was put on after the war?

Major BURNS. Yes, sir.

The CHAIRMAN. And under this contract with the Alabama Power Co.?

Major BURNS. At the expense of the Government; yes, sir.

The CHAIRMAN. At the expense of the Government. All right. Now, go ahead.

Major BURNS. All of the land belongs to the Alabama Power Co. The Government-built improvements were all put upon the Alabama Power Co.'s property. Of course, the idea constantly was that the whole thing would be sold to the Alabama Power Co. after the needs of the Government had been met.

The power plant proper consists of boiler plant and turbines, and these are under the same roof as those owned by the Alabama Power Co. Both Government and Alabama Power Co. plants are fed by water that comes through the same water intake. The coal comes up over railroads that are jointly owned, and power goes out through a substation that is jointly owned. The housing facilities are half the Alabama Power Co.'s and half the Government's. The Alabama Power Co. has a large coal mine in this vicinity, and they have various openings in the adjacent hills through which they extract coal for use in this plant. The Alabama Power Co. put its plant here because of this excellent location in the matter of coal supply.

Senator HEFLIN. Power is furnished to nearly all of these coal mines around there from this plant?

Major BURNS. I think so; yes, sir.

In order to get power up to Muscle Shoals there was constructed what is known as the Warrior-Sheffield transmission line, 90 miles long, which carries or could carry about 30,000 kilowatts of energy.

This was also constructed by the Alabama Power Co. at a cost of approximately a million dollars.

The CHAIRMAN. That is, the transmission line?

Major BURNS. Yes, sir.

The CHAIRMAN. I was under the impression the Government constructed that.

Major BURNS. It was constructed by the Alabama Power Co. at Government expense.

The CHAIRMAN. The Government put up the money?

Major BURNS. Yes, sir. The land on which the transmission line was built is either owned or controlled by the Alabama Power Co.

The CHAIRMAN. I supposed it ran along public highways.

Major BURNS. No, sir. There is a right of way 90 miles in length over the mountains. I think it is 100 feet wide.

The CHAIRMAN. Owned by the Alabama Power Co.?

Major BURNS. Either owned or controlled by it. And we have an agreement with the Alabama Power Co. by which that transmission line will also be sold to the Alabama Power Co. in the same way, or practically the same way, as the Gorgas power plant is to be sold.

The CHAIRMAN. This right of way was not owned, at the time this contract was made, by the Alabama Power Co., was it?

Major BURNS. No, sir; but the Alabama Power Co. acquired the right of way. I think the reason why they acquired it at that time was that the Government officials did not feel that they had authority to get the land in the name of the United States. They felt that there was a restriction of law prohibiting them from either purchasing the land or getting rights of way over the land.

Senator MCKINLEY. Someone down there told us that the Alabama Power Co. did own, at the time the war started, 30 miles of that right of way.

Major BURNS. I have no doubt but what that is correct.

I should add, in order to more fully cover the matter, that the question as to whether the option of the Alabama Power Co. to purchase the Gorgas plant was legal was submitted to the Judge Advocate General, and he held that it is null and void; but the Ordnance Department feels very strongly that the Government ought to live up to the contract, and dispose of the property, in accordance with the contract, to the Alabama Power Co. It was made in good faith, and we feel that the Alabama Power Co. has played the game fairly with the Government, and is entitled to a fair solution to the problem.

The CHAIRMAN. The Gorgas plant and the transmission line are something entirely independent of the Muscle Shoals improvement or any of the governmental activities there, as I understand it. It could be separated without injuring anything else?

Major BURNS. It is a matter of judgment. In my judgment it absolutely can be. I can see practically no tie-up between Gorgas and Muscle Shoals. However, there are other people that do not feel that way about it.

The CHAIRMAN. I can see how they could use them together, but without any injury they could be used separately, it seems to me.

Major BURNS. That is my judgment.

The CHAIRMAN. Of course, they could both be used by the same people in the same business. That is perfectly clear.

Major BURNS. Yes, sir.

The CHAIRMAN. But it would be a difficult thing to divide this scrambled egg over Gorgas between the Government and the Alabama Power Co., it seems to me, no matter how anxious you might be to do it.

Major BURNS. Yes, sir.

Senator NORBECK. I want to get back to that Haber plant. They got their power from the Warrior plant for the purposes of construction work?

Major BURNS. They have been getting all of their power at the Wilson Dam from the Alabama Power Co., carried up over this 90-mile transmission line through the nitrate plant to Wilson Dam, which is connected with nitrate plant No. 2 by transmission line.

Senator NORBECK. They are getting it from the Alabama Power Co.

Major BURNS. Yes, sir.

Senator NORBECK. Not from the Government plant at Gorgas?

Major BURNS. Well, the Government plant at Gorgas is being operated by the Alabama Power Co. under contract. They have to pay us so much per kilowatt-hour for every unit of energy generated in that plant.

Senator HEFLIN. Suppose Mr. Ford should get Muscle Shoals and go on with the construction of the dam there; where would he get his power?

Major BURNS. He could get it from the steam plant at No. 2. He could put that in operation, or he could put the steam plant at nitrate plant No. 1 into operation, or if he didn't want to do either he could purchase power from anybody that would sell it to him.

Senator HEFLIN. Could he get all the power he needed at plant No. 2?

Major BURNS. Oh, yes. He could get 60,000 kilowatts. He would use 2,000 kilowatts, at the most, in construction.

The CHAIRMAN. The Government, if they were going to complete it, would utilize or at least it has two steam plants that could be utilized?

Major BURNS. Yes, sir.

The CHAIRMAN. One at nitrate plant No. 1 and one at nitrate plant No. 2.

Major BURNS. Yes, sir.

The CHAIRMAN. With a combined horsepower of what?

Major BURNS. Sixty-five thousand kilowatts.

Senator MCKINLEY. One hundred and thirty thousand horsepower.

Senator HEFLIN. But plant No. 2 can not be used, then—

The CHAIRMAN. Let us get this definitely on the record before we leave it.

Is that kilowatts or horsepower?

Major BURNS. It would be 65,000 kilowatts, or nearly 90,000 horsepower.

The CHAIRMAN. Plant No. 2 has 90,000 horsepower capacity, has it not?

Major BURNS. It has 60,000 kilowatts, and that would be—

Senator MCKINLEY. What about these two 2,500 kilowatts in there?

The CHAIRMAN. Let him answer that question first, if you please. I want to get that definitely.

Major BURNS. No. 2 plant has installed generating capacity to the extent of 60,000 kilowatts.

The CHAIRMAN. Yes; but that is not its full capacity.

Major BURNS. Yes; that is its full generating capacity.

The CHAIRMAN. Is it?

Major BURNS. Yes, sir. It has, however, boiler capacity installed which would allow you to generate 90,000 kilowatts.

The CHAIRMAN. That is what I was thinking about.

Major BURNS. But the generating equipment has not been installed, although the place is there for its installation.

The CHAIRMAN. I understand. Then the power capacity of that steam plant No. 2 is how much?

Major BURNS. At present the generating capacity—

The CHAIRMAN. Not the generating capacity. What is the total power capacity? If you haven't got the machinery there, put in enough.

Senator MCKINLEY. He means the steam boilers.

Major BURNS. There is steam capacity there for 90,000 kilowatts.

The CHAIRMAN. That would be how many horsepower?

Senator MCKINLEY. About 120,000?

Major BURNS. About 120,000 horsepower.

The CHAIRMAN. Well, that is more power than anybody would use to build Dam No. 1 and Dam No. 2, even if they built them both at once, is it not?

Major BURNS. Oh, yes. The power requirements for the construction of dams is relatively small.

The CHAIRMAN. As far as using power for the construction of either one or both of these dams is concerned, it is not at all necessary to have the Gorgas plant?

Major BURNS. No, sir.

Senator MCKINLEY. They could buy the power from the Alabama Power Co. for the small amount of power required cheaper than they could keep up the fires in those steam plants?

Major BURNS. Yes, sir; and that is what the Government has been doing for two years.

Senator HEFLIN. And it came from the Gorgas plant?

Major BURNS. It came from the system of the Alabama Power Co. It might have come from Gorgas or from the Coosa River hydroelectric plant.

Senator MCKINLEY. Is it not a fact that they only run the Gorgas plant two or three months in the summer?

Major BURNS. They run it more than that. They run it, I should say, three-fourths of the time.

Senator MCKINLEY. I should think they would use water power.

Major BURNS. As I understand it, their load is so heavy that they have to back it up almost constantly with the Gorgas steam plant.

The CHAIRMAN. The steam plant at Government nitrate plant No. 2 indicates that even with Gorgas they are not sure of having power all the time?

Major BURNS. Yes, sir; that is correct.

The CHAIRMAN. They are paying us \$40,000 a year, are they not, for steam plant No. 2?

Major BURNS. They are paying us \$10,000 a month and 2 mills for each kilowatt hour that they generate.

The CHAIRMAN. In addition?

Major BURNS. In addition; yes sir. And they are also required to maintain the plant and turn it back to the Government in as good condition as when it was received by them.

Senator HEFLIN. Major, I understand you to say that plant No. 1 can be used now for power purposes?

Major BURNS. Yes, sir; it could be. Of course, it would be very expensive power, because that is a small power plant.

Senator MCKINLEY. It could make 5,000 kilowatts there for all the dam construction?

Major BURNS. Yes, sir.

The CHAIRMAN. That would not be expensive power, would it, Major? Why is it expensive?

Major BURNS. Any small power plant is expensive.

The CHAIRMAN. Yes; but if you are using it to its capacity. You shut down your big plant because you did not need so much power, you say. Can't you operate the little plant at nitrate plant No. 1?

Major BURNS. We studied that, and we found we could buy power from the Alabama Power Co. much cheaper than we could operate that plant.

Senator McKINLEY. It would probably cost you 15 mills to operate that plant and you could probably buy it for about 9 mills?

Major BURNS. About that. I think it would cost us in excess of 2 cents, or 20 mills, to make power at that plant.

The CHAIRMAN. How far, Major, without material loss, can this energy be carried?

Major BURNS. Well, I think that they figure that you can carry power about 150 miles, though I saw a piece in the paper a few weeks ago which showed that out in California they were getting ready to carry power 300 miles.

Senator McKINLEY. Is it not a fact, Major, that San Francisco is supplied with power from 200 miles away? In fact, it is supplied from plants in two directions 200 miles, where the plants are 400 miles apart?

Major BURNS. It is essentially a question of the voltage that is used. The ordinary voltage to-day is about 110,000 volts, and they are constantly endeavoring to raise that. Out in California they are hoping to send power at 220,000 volts. The more pressure you get behind power the less your line loss is. I don't think there is any doubt but what in a few years they are going to extend the zone over which power can be sent economically very materially.

The CHAIRMAN. If that occurs, as it is likely that it will, laying aside all the other questions that we have been discussing, if that improvement occurs, then that of itself would add very materially to the value of a power development like Dam No. 2?

Major BURNS. Oh, yes, sir; very materially. A few years ago that power could have been used only in a very small radius around Muscle Shoals. Now it can unquestionably be used economically 150 miles, and, as I said before, I don't think there is any doubt but what in a few years that radius will have been increased to probably 300 miles or more.

Senator HEFLIN. Don't they claim now that you can transmit between 350 and 400 miles?

Major BURNS. There is no doubt but that you can transmit that distance, Senator. It is a question of how economically you can do it, because your losses and transportation charges mount up quite rapidly as the distance increases.

The CHAIRMAN. Now, as I understand it, the value of this development down there, or the possibility of utilizing it for fertilizer purposes, depends to some extent upon several things. One is the development of improvements in the machinery for extraction of nitrates from the air. That looks favorable. Another one is whether or not at reasonable cost reservoirs can be built in the upper Tennessee or its tributaries that would increase the amount of primary power.

Major BURNS. Yes, sir.

The CHAIRMAN. Are there any other possibilities that might improve the situation, outside of those two I have mentioned?

Major BURNS. I think the principal ones are the cheapness of power and further developments in the chemical processes.

The CHAIRMAN. Unless we can cheapen the power or cheapen the process, we can not hope to manufacture fertilizer from plant No. 2 cheap enough to compete with the markets of Chile. Is that your idea?

Major BURNS. You can not lower the price of Chilean nitrate by the operation of plant No. 2, as I see it to-day. I have always felt, however, if that plant were operating, that it would have a stabilizing effect upon nitrogen fertilizer materials, because it would eliminate some of the hills, so to speak, of the prices in materials. But the No. 2 plant, as things stand to-day, can not be relied upon to have any appreciable effect in reducing the present-day prices of nitrogenous fertilizers.

Senator McKINLEY. Major, let me ask you this: This is something I don't know about, along with a good many other things. These by-product coke ovens. Tell us about that. Is that from all coke ovens?

Major BURNS. No, sir. It only comes from the by-product ovens. As you know, there are two methods of making coke. One is by the beehive oven, and the other is the by-product oven.

Senator McKINLEY. The beehive is the one you see along the railroads?

Major BURNS. Yes, sir. In the beehive ovens, you put a lot of coal in the oven and burn all the gas as it comes from the coal, and that gives you enough heat so that the volatiles of the coal are driven out. The volatiles amount, roughly, to 30 per cent of the weight of the coal. After that process is complete you have nothing left but some coke and ash, as all of the gases have been burned.

In the by-product system the coke is put in an oven and it is heated through the brick on the side, and all the gases are driven off but are all collected and used for one purpose or another. In other words, 30 per cent of the weight of the coal is saved in the form of by-products. One ton of coal in a by-product oven will produce about 11,000 cubic feet of gas. It will produce about 10 gallons of coal tar; it will produce about 5 pounds of ammonia; it will produce about 3 gallons of light oils, or motor spirits.

The CHAIRMAN. And after you have gotten these by-products you still have the coke left?

Major BURNS. Yes, sir.

The CHAIRMAN. How much coke now?

Major BURNS. In a beehive oven you would get about 0.65 ton of coke from a ton of coal, and in the by-product oven you get about 0.70 to 0.73 of a ton of coke per ton of coal. In other words, you get about 10 per cent more in the by-product oven.

The CHAIRMAN. Of coke?

Senator McKINLEY. About three-quarters of the weight in coal you get in coke?

Major BURNS. Yes, sir. It all depends, however, upon how much volatiles there happen to be in the coal. Coals vary. Everything that you get from a ton of coal in a by-product oven is worth about 50 per cent more than what you get out of a beehive oven.

Senator McKINLEY. Where do you get your ammonia?

Major BURNS. That is included as one of the gases driven off in the production of the coke and can be separated from the other materials. As I said before, you get about 5 pounds of ammonia per ton of coal. They are coking sufficient coal in these ovens now so that, all told, there are some 100,000 tons of nitrogen recovered in the form of ammonia each year.

Senator McKINLEY. That comes out of that ammonia?

Major BURNS. Yes, sir.

The CHAIRMAN. Now, Major, if all the coke was made in by-product ovens how much would that increase the nitrate?

Major BURNS. It would nearly double it, sir. At the present time we are coking in by-product coke ovens over 60 per cent of all coal coked.

Senator McKINLEY. Tell us why it is that anybody can afford to use these beehive ovens when by that means they lose not only a portion of the coke but all these other by-products that are more valuable than the coke itself?

Major BURNS. There are certain economic reasons for it. In the first place, there is no market for the gas in some sections of the country.

Senator McKINLEY. No; that is true.

Major BURNS. And it is the same with some of the other by-products, and freight is often the deciding factor.

The CHAIRMAN. Your nitrates are valuable, are they not?

Major BURNS. They are always valuable; yes, sir; but the by-product coke oven costs a lot more than a beehive oven, and therefore requires satisfactory markets for its by-products to justify the increased costs. Furthermore, you can not shut down a by-product coke oven the way you do a beehive oven, because every time you shut it down contraction sets in and the brick walls are injured. So that the beehive oven will exist and be necessary as a minimum to take care of the varying load. As you know, the steel industry has just gone through a very marked period of depression. During that depression they did not use nearly as much coke as ordinarily.

The CHAIRMAN. They have to have coke?

Major BURNS. Yes, sir.

The CHAIRMAN. They can not use coal at all?

Major BURNS. No, sir. They are the big consumers of coke. However, some anthracite coal is used.

When they had to shut down their ovens because they did not have the demand for coke the first ovens shut down were the beehive ovens, and the by-product ovens were kept in operation. In the steel business there is a fluctuation of some 25 to 30 per cent of the average production. It is our judgment that you can look forward to further extension of the by-product coke oven business, but I do not believe you will ever be able to coke 100 per cent of all coal in by-product ovens. We think if you get up to 70 or 75 per cent you will be doing extremely well. Now we have reached a percentage of over 70. In other words, we have gone over half the way.

The CHAIRMAN. In how long a time? These by-product ovens are comparatively modern, are they not?

Major BURNS. Yes, sir. I can give you that quite accurately.

The CHAIRMAN. I think that would be very well to have that in the record. I think it would be a very important thing for anybody who studies the record to be able to find that.

Major BURNS. I have a short paragraph here, taken from an ordnance paper, in reference to this subject:

"By-product coke ovens were developed by the Germans and first introduced into America about 1893. From this time until 1914, when the World War started, development was such that only 25 per cent of the coke used in the United States was coked therein. Since 1914 the increase has been quite rapid. The growth was developed during 1915 and 1916 by the purchase by the Allies of by-products at high prices. In 1917 and 1918 the Ordnance Department, in order to obtain increased supplies of ammonia and toluol, further speeded up construction. As a result of all these efforts the country is at the present time coking in by-product coke ovens 60 per cent of all its coke."

The CHAIRMAN. I guess it is about time to adjourn.

Senator HEFLIN. Mr. Chairman, there is one thing I want to ask the major before we leave this point.

The CHAIRMAN. All right.

Senator HEFLIN. You expressed doubt as to whether fertilizer could be produced at Muscle Shoals in competition with commercial fertilizer. Henry Ford claims that he can and will produce fertilizer there, and that he can do it cheaper than it is now being produced. The fact that the fertilizer trust in the United States is fighting the Ford bid would indicate that they fear that he can do it.

Major BURNS. The fact that they are fighting it indicates that they fear him as a competitor all right. There is no doubt about that.

Senator HEFLIN. Yes; which would indicate that the producer was going to be able, if Ford got it, to get his fertilizer at less than he now gets it.

Major BURNS. It seems to me you could interpret it that way.

Senator MCKINLEY. If it is agreeable to the chairman, Major, I wish you would put into the record at the proper place what, in your judgment, nitrate, as we consider—that means like the Chilean nitrate—what, in your judgment, it would cost down there on the basis of 3 mills per horse-power; about what it would cost per ton; that is, we figure at three-quarters to 1 mill, it would cost \$50.

The CHAIRMAN. Yes. I think you see the point there.

Major BURNS. Yes, sir.

The CHAIRMAN. That would help us a good deal, Major, if you would do that.

Major BURNS. All right, sir.

(This information is inserted at a later point.)

(Whereupon, at 12 o'clock, noon, the hearing was adjourned to 10.30 o'clock a. m., Friday, April 14, 1922.)

MUSCLE SHOALS.

FRIDAY, APRIL 14, 1922.

UNITED STATES SENATE.
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris presiding.

Present: Senators Norris (chairman), McKinley, McNary, Capper, Norbeck, Kendrick, Harrison, and Heflin.

The CHAIRMAN. The committee will come to order. You may proceed, Major Burns.

STATEMENT OF J. H. BURNS, MAJOR, UNITED STATES ARMY— Resumed.

Major BURNS. I have very little more to say, Senator. I would like to show the relationship between nitrate plant No. 2 and nitrogen preparedness from a military standpoint. That, of course, has always been one of the prime objects of nitrogen fixation.

I have drawn two charts, one to show the general principle that you have to apply to munitions preparedness if you are going to be prepared for some future war, and the other is the application of the general principle to nitrogen.

The principle the Ordnance Department is striving to get established is that we must have on hand at all times sufficient stocks of munitions to tide us over until new production is adequate to meet the demands of the war plans, whatever they may be.

I have drawn here a theoretical curve of requirements to indicate the needs of the Army for munitions delivered at the fighting front.

Then I have drawn also a curve of production to indicate the production in any particular kind of munitions that America is able to achieve. Sooner or later munitions production can be made equal to, if not greater than, consumption; but during the early days of the war production can not equal consumption, because in the ordinary instance it takes at least 12 months longer to manufacture munitions and deliver them to the fighting front than it does to create new man power and place it upon the battle front.

The CHAIRMAN. You mean it would take longer to get munitions than it would to get the men?

Major BURNS. Yes, sir. On the average it takes at least 12 months longer to get munitions than men. That is very clearly proven by the experience of the World War, because, as you undoubtedly appreciate, while America did its best to get munitions, it was able to get practically no munitions of major size to the front lines, even though the war had continued for nearly 18 months.

Senator HARRISON. Of course that did not apply to Germany?

Major BURNS. No, sir; but the Germans met their problem by having quite large stocks of munitions on hand in order to tide over the production development period, while we had practically none.

Senator HARRISON. That statement just applies to the United States?

Major BURNS. Of course, that principle applies to any nation. They must have on hand stocks of munitions to tide over until production is adequate. To repeat, in the World War I do not believe we fired more than a few shots of large caliber munitions. Practically every large gun and every round of muni-

tion, therefore, was obtained from the Allies, and the reason for it was that we had no stocks on hand. As I said before, there will come a time when production will equal consumption. Therefore, if you want to be adequately prepared for any war plan you must have reserve stocks on hand as a minimum equal to the difference between the production curve and the consumption curve at the time the rate of production equals the rate of consumption. That is represented by this line here [indicating]. That is the general principle of munition preparedness.

Now, I have applied the general principle to nitrogen on the assumption that we would raise an army in a future war at about the same rate at which we raised it in the World War. It is assumed also that it would be placed in battle at an earlier date than our World War Army. These assumptions give us a definite statement of requirements.

This curve indicates the requirements of nitrogen under such an assumption, and shows that about 22½ months after the war we would have required a total of about 110,000 tons of nitrogen, all delivered at the fighting front.

This [indicating] is the curve of production that we think we could get from America. In order to develop the curve of production we have to make certain assumptions. In the first place, we never need to fear for nitrogen preparedness if we can continue to get nitrates from Chile. So the condition that we have to protect ourselves against is when nitrogen importations have been stopped, due to loss of free use of the seas.

That is our first assumption.

Then, in addition to your military requirements, you have to take care of the requirements of the fertilizer people and of the chemical industry, and I have made the assumption here that the by-product coke-oven capacity of the country would be adequate to take care of the fertilizer needs and of the chemical industry. They could only do it, however, by materially reducing the quantity of nitrogen that both the fertilizer people and the chemical people would consume. That could be done if we were fighting purely a defensive war, because we would not have to raise crops of one kind and another for the supply of foreign nations; we would only have to raise crops for the supply of America itself.

Then I have assumed that the No. 2 nitrate plant, which is very important from the standpoint of production of nitrogen, would be available, in stand-by condition. Of course, if it were operating at the time the war started it would be just that much more of a guaranty of nitrogen preparedness. Unfortunately, if we start to build a nitrate plant to-day you can not get the product of that nitrate plant in the form of munitions to troops at the front in less than about 22½ months, because you have to construct your nitrate plant, then you have to put it in operation and develop full operation, and then when you get the product it still requires 7½ months in order to convert it into munitions and deliver it to the firing line. This is because the nitrogen has to be sent to powder plants, or explosive plants, and there converted into powder and explosives, and then these have to be sent to assembling plants and put in the form of complete rounds of ammunition, and these latter in turn have to be tested, and then forwarded to the troops at the front, wherever they may happen to be.

So that it is the judgment of the Ordnance Department that we could not hope to make nitrate production equal nitrate consumption in less than about 22½ months after war was started.

As I said before, this bottom curve represents production we think we could get out of America of nitrogen in the form of munitions delivered at the battle front.

Therefore, if we are going to have adequate nitrogen preparedness, we must have on hand a stock equal to the maximum difference between our production curve and our requirement curve, and in this instance it amounts to 74,000 tons, even with the No. 2 nitrate plant in operation. As a matter of fact, that is approximately the amount of nitrogen that we have on hand. Part is in the form of nitrate of soda; it is in the form of smokeless powder; it is in the form of high explosives; it is in the form of ammunition.

But as we stand to-day in America, even with importations stopped, that stock of nitrogen would supply an Army that was raised and fought in about the same way that the World War Army was raised and fought.

You can see the big part that the No. 2 plant plays in the solution. It represents, during the first 22½ months of the war, over 75 per cent of the nitrogen

which we would get from new production even with a standing start. If the plant were in operation, this curve would immediately swing up and you would still get the solution with lesser stocks of nitrogen. In other words, you could reduce the quantity of nitrate of soda that you are keeping. It was on that principle that the Ordnance Department recommended, provided the bill that was before the Agricultural Committee some two years ago passed, that the stocks of nitrate which had been held at 300,000 long tons should be reduced to 150,000 tons.

The CHAIRMAN. In other words, as I understand, it is reduced to this, that if nitrate plant No. 2 were ready to operate on a moment's notice and kept in that condition all the time it would be the same kind of a safeguard that we provide ourselves with by storing up a whole lot of explosives?

Major BURNS. That is correct; yes, sir.

The CHAIRMAN. So that instead of storing a lot of explosives, with that plant ready to operate on a moment's notice, you would avoid the storage of—

Major BURNS. That is correct.

Senator HEFLIN. It would release all this nitrate of soda that has been stored up for fertilizer purposes?

Major BURNS. Not all of it; but you could release its equivalent. It would have to be worked out on the principle I have endeavored to describe.

The CHAIRMAN. Now, Major, compare the expense of keeping this nitrate plant ready for operation, even if we should not operate it, but keep it in standby, as you put it—

Major BURNS. Yes, sir.

The CHAIRMAN. With the expense of keeping instead the amount of explosives that we have. That is a very expensive proposition, as I understand it, even the storage?

Major BURNS. That plant is just as good to us, in my judgment, as stocks of about 150,000 tons of nitrate of soda, and 150,000 tons—

The CHAIRMAN. How much would it cost to keep 150,000 tons of nitrate of soda?

Major BURNS. One hundred and fifty thousand tons of nitrate of soda, at the present market, are worth approximately \$7,500,000.

Senator McKINLEY. Does it deteriorate?

Major BURNS. No, sir. There is no deterioration. There is some loss. It is very slight, though, if properly stored. Nitrate of soda will absorb moisture so rapidly that some of it will run off unless you have practically watertight foundations to hold it.

The CHAIRMAN. Where do you keep it, and what does it cost to keep it?

Senator McKINLEY. I will put it this way: What percentage is there of deterioration?

Major BURNS. There is no deterioration, but there might be a wastage of approximately one-half per cent per year.

Senator McKINLEY. That would be one-half per cent per year on \$7,500,000?

Major BURNS. Yes, sir.

The CHAIRMAN. Where is it stored and how is it stored, and what do you have to do to store it?

Major BURNS. As I said before, the big thing is to keep rain away. That is all.

The CHAIRMAN. Isn't it explosive and dangerous?

Major BURNS. No, sir. Nitrate of soda is not explosive.

The CHAIRMAN. How much are we paying now for rental where we store this stuff?

Major BURNS. We have none of our nitrate of soda at the present time in leased storage. So our expense is that of guarding and maintaining buildings in which the nitrate is stored.

The CHAIRMAN. You have to protect it from fire?

Major BURNS. Yes. It should preferably be of fireproof construction, because nitrate of soda, in the presence of anything that will burn, causes a very rapid fire.

The CHAIRMAN. If the building were burned, it would burn up?

Major BURNS. The building would burn up, but all the nitrate of soda would not burn.

The CHAIRMAN. It would not burn?

Major BURNS. No, sir. Part of it would, but only a part. It is only inflammable when in the presence of some inflammable material, or some material that would burn, like wood or things of that nature.

The CHAIRMAN. If the building burned—

Major BURNS. It will burn so long as the wood is there to support combustion.

The CHAIRMAN. As soon as the wood was burned up it would stop?

Major BURNS. Yes, sir.

The CHAIRMAN. And the fire would go out?

Major BURNS. Yes, sir. It would not burn alone.

Senator MCKINLEY. What is the cost of storage?

Major BURNS. I could only give you a guess on that, Senator. I think that the storage charges per year, now that all nitrate has been removed from leased storage, are not very large. I should say that 150,000 tons could be stored at an annual charge of not in excess of \$25,000.

The CHAIRMAN. I understood, Major, when we had this question up a couple of years ago, the testimony showed the storing of these nitrates was a very expensive proposition.

Major BURNS. At that time it was, Senator, for the reason that we had 300,000 tons of nitrate of soda then, and a large part of it—I think some 80,000 tons—were stored in leased storage, for which quite a high rental had to be paid. In the meantime the War Department has disposed of 80,000 tons of that reserve, or practically all that was in leased storage, and so that yearly rental has been eliminated.

The CHAIRMAN. Well, is it a dangerous proposition to dispose of that? Why was that done?

Major BURNS. The Secretary of War, in his judgment, thought that the stock could be reduced to 220,000 tons.

The CHAIRMAN. Did the fact that we had this nitrate plant have anything to do with that?

Major BURNS. I don't know what was in the Secretary's mind.

Senator MCKINLEY. You still had in storage 220,000 tons?

Major BURNS. Yes, sir.

The CHAIRMAN. The fact remains, however, that prior to that time they thought it necessary to keep a lot more in storage than they keep in storage now. Now, the question in my mind is why this change? Did this nitrate plant then having come into existence have anything to do with that?

Major BURNS. The nitrate plant has always been considered as a part of our nitrogen preparedness. Of course, I can not speak the Secretary's mind, but everything in military preparedness hinges upon the probable war Army that you are going to provide for. There never has been established in the United States a munitions policy based upon a probable war Army. It is just the judgment of the Secretary of War as to what provision should be made. Naturally he thought that if he kept 220,000 tons of nitrate of soda it would be sufficient for the probable war Army.

The CHAIRMAN. What I am trying to reach is why this change? Assuming the nitrate plant that we have now completed has nothing to do with it and had nothing to do with it, then our policy was wrong when we were keeping so much, apparently, or it is wrong now, when we have so little. One or the other must follow, it seems to me.

Major BURNS. Your conclusion would be absolutely correct, Senator. If we were always working to the same plan. But, as I said before, your war plan is a changeable proposition.

The CHAIRMAN. What caused the change by which you can get along with less storage of nitrate of soda now than before?

Major BURNS. I can not answer that.

Senator MCKINLEY. In the first place, Secretary Baker recommended an Army of half a million, and then the Army bill was passed providing for 220,000.

The CHAIRMAN. I don't think it had anything to do with our peace Army. The storage for this was in preparation for war.

Major BURNS. That is correct. The size of the peace Army has no connection with the solution of the question as to the amount of nitrates which you store for the war Army.

Senator MCKINLEY. Mr. Chairman, if you want to put into the record the cost of keeping that 150,000 tons, I have figured it out here.

The CHAIRMAN. All right.

Senator MCKINLEY. He said it would cost \$7,500,000. Five per cent would be \$375,000; one-half per cent wastage would be \$37,500; for storage, \$25,000, making \$437,500 as the cost of keeping 150,000 tons.

The CHAIRMAN. Now, this nitrate plant No. 2 is complete in every respect. It is modern in every way, backed up by a steam plant that can give power enough to operate it?

The CHAIRMAN. It is ready to start on a moment's notice as soon as you can build your fire under your boilers? Is not that true?

Major BURNS. Yes, sir.

The CHAIRMAN. Right now?

Major BURNS. That is correct; yes, sir.

The CHAIRMAN. If we complete these dams, or one of them, we will have that, in addition, as cheap power?

Major BURNS. That is correct; yes, sir.

The CHAIRMAN. So that whether we can make nitrates and get them out of the air from this plant in peace times for a sum that would be sufficiently low to supply fertilizer in time of peace, the fact remains that in time of war, if we were pushed to it and had war to-morrow, you would be able to immediately start this plant to work?

Major BURNS. That is correct; yes, sir. As we stand to-day on nitrogen, in my judgment we are sufficiently protected, even though importation stops, so that we could supply an Army that was raised as rapidly as our World War Army was raised and fought at a more rapid rate. In the World War we did not start fighting so rapidly as we would have to in a defensive war, because our battle front was some 5,000 miles away from America, and, as a consequence, it took a long time to transport troops that distance and put them on the firing line. But we are protected only provided that we retain No. 2 plant at least in stand-by. If the No. 2 plant is operated we would get additional protection; and you could bring yourself back to the same quantity of protection in this case by disposing of some of your stocks of nitrate of soda.

The CHAIRMAN. How much additional security, if any, is added to that by nitrate plant No. 1, assuming that you would spend \$5,000,000 and take out that machinery that is no good and put in modern machinery?

Major BURNS. Well there would be an appreciable increased protection from two standpoints. One would be that our protection curve would be raised, because there would be additional capacity.

The CHAIRMAN. How much more?

Major BURNS. You would have at least 20 per cent more, because that plant is one-fifth of the No. 2 plant. But over and above that you would have a greater amount of knowledge in America that could be applied to the construction and operation of nitrate plants and that undoubtedly would have the effect of further increasing production. That would be a matter of judgment. I do not know how much it would be, but I think it would be greater than even the 20 per cent.

Senator HEFLIN. How much would these two plants, when completed and in operation, lack of supplying us with the nitrate that we need?

Major BURNS. In time of war?

Senator HEFLIN. Yes.

Major BURNS. Those two plants would give you sufficient nitrogen for about 14 divisions of an army.

The CHAIRMAN. How many men?

Major BURNS. A full division has about 35,000. It would be fourteen times 35,000.

Senator MCKINLEY. Half a million?

Major BURNS. Yes; about half a million.

As an indication of the importance, from that point of view, I would like to say, in the Meuse-Argonne offensive, which was the maximum military effort of the United States in the World War, we had either on the battle front or in reserve so that they could be put on the battle front, about 30 divisions. So, these two plants would give you nitrogen preparedness for about half the divisions we were able to put into the World War.

The CHAIRMAN. Where would we get the balance from?

Major BURNS. You would have to get the balance by building new plants and pending the time when the new plants would come into use you would use your reserve stock.

Senator NORBECK. Are there not now commercial plants manufacturing nitrogen?

Major BURNS. Yes, sir.

Senator NORBECK. What is their capacity?

Major BURNS. There is at Syracuse the plant of the Air Nitrates Corporation, which is the only plant of any appreciable importance. The Nitrogen Products Co. has a very small plant which uses the arc process, and is located in the State of Washington.

Senator McKINLEY. Is this 100,000 tons a year of by-product nitrogen available?

Major BURNS. It would be available, but in my judgment you could not depend upon it for military purposes. You would have to turn that over to the fertilizer industry and to the chemical industry. As you know, all of the domestic explosives in America are made from nitrogen. Of course, you can not curtail such production in time of war, because they are of as much importance, if not more, in time of war than in time of peace.

The CHAIRMAN. Then, Major, as I understand it, to get down to a practical proposition, these nitrate plants we own now in Alabama as a war proposition entirely, are justified, in your judgment?

Major BURNS. Yes, sir.

The CHAIRMAN. Not only justified, but it is practically necessary for us to keep them in condition so that they can be operated as a matter of war preparation?

Major BURNS. In my judgment that is true with reference to the No. 2 plant. I do believe, however, that we have adequate nitrogen preparedness even though the No. 1 plant were disposed of. If the No. 1 plant were perfected and made available for operation you would have just that much additional preparedness.

The CHAIRMAN. In case of war now, from your testimony as I understand it, we would have to build additional nitrate plants?

Major BURNS. That is correct; yes, sir.

Senator KENDRICK. Major, would it not be necessary to operate them at least part of the time to keep them in condition?

Major BURNS. I have no doubt but what that is so, Senator, because we do not know how long that No. 2 plant will remain ready for operation in case we do not turn it over.

The CHAIRMAN. Let me ask you this, Major:

The completion of dams Nos. 1 and 2 only adds to this war preparation by making it more economical. Is not that true?

Major BURNS. No; that is not wholly true.

The CHAIRMAN. To what extent is it true?

Major BURNS. Because it took the Government longer to produce power in this war than almost anything else. We had the chemical plant at Muscle Shoals ready for operation long before the steam power plant at Muscle Shoals was ready. The chemical plant was not ready, however, before the Gorgas plant that the Alabama Power Co. constructed was available. If the Wilson Dam were completed you would have, in round figures, an additional 200,000 horsepower, which would allow you to operate two plants additional to the No. 2 plant, and it would give you, from a power standpoint, very much greater preparedness.

The CHAIRMAN. That is leading up to what I want to raise.

We would be justified as a war proposition, therefore, as I understand your testimony, in completing Wilson Dam?

Major BURNS. Absolutely.

The CHAIRMAN. Even though we never use it in time of peace?

Major BURNS. Absolutely; yes, sir. There is no question about it.

The CHAIRMAN. And we are justified in maintaining nitrate plant No. 2, together with the steam power with which to operate it, that we have there, and keeping them in prime condition, even though we got nothing out of them absolutely, except in time of war?

Major BURNS. Yes, sir.

The CHAIRMAN. Taking those assumptions as true, having a power developed at Wilson Dam and having the machinery there to manufacture nitrates, would we not be justified, then, in using them in time of peace, assuming that we do not injure them in any way, and use would not injure them, as I understand it—

Major BURNS. No; use would help them.

The CHAIRMAN. It would help them. Then would we not be justified in using them, for instance, to make fertilizer, without considering any capital cost whatever, and if by the use of the power and the use of the plants we could make fertilizer that would compete with the present market price, and

consider nothing except operating cost, would we not be justified in doing it in time of peace?

Major BURNS. From a preparedness standpoint you would unquestionably be justified; yes, sir.

The CHAIRMAN. Now, if we did not figure any cost except the additional machinery that it would be necessary to put in, that is of no use in time of war but would be useful to make fertilizer, consider only that, and we manufacture fertilizer, how cheaply could we make fertilizer, assuming that our Wilson Dam has cost us nothing, because we have got that anyway, and we are going to have that anyway if we carry out your theory, as a war proposition. Then base your calculation for fertilizer entirely on cost of operation and on cost of the necessary machinery that you would have to put in in addition to what you have there to make fertilizer?

Major BURNS. You are going to charge your hydroelectric power up to just operating expenses only?

The CHAIRMAN. Just operating expenses only.

Major BURNS. I imagine that would be about a quarter of a mill per kilowatt-hour, would it not, Colonel Barden?

Colonel BARDEN. I will figure it out.

The CHAIRMAN. Let me ask you, in your judgment, what is wrong, if anything, with my assumption? Is there anything wrong with it?

Major BURNS. From the military standpoint only there is nothing wrong.

The CHAIRMAN. If for military purposes we are going to have this dam, we are going to continue this machinery just as we have it now, just keep it there ready for use on a moment's notice, and all this power going to waste, doing nothing with it, would we not be justified and, as a matter of fact, as long as we do not injure that property but, as you say, improve it, for the purpose of doing some useful act—and I am assuming that making fertilizer would be such useful act, or you could take anything else, but for the purpose of this question I am taking fertilizer—would we not then be justified in not charging up against the cost of fertilizer anything as to the cost of the Wilson Dam or anything as to the cost of this machinery or its upkeep, because we have to keep that up anyway as a military proposition?

Major BURNS. Of course, you are getting into the problem of economics now that hardly feel qualified to discuss, because if the Government builds that large power plant and then gives the power at practically zero—

The CHAIRMAN. Yes.

Major BURNS. For use in the manufacture of fertilizer, you are undoubtedly creating what you might term an interior subsidy in the matter of fertilizer production, and you would undoubtedly hurt a great many fertilizer companies that have spent lots of money in their business.

The CHAIRMAN. Of course, that is a question of policy on which the military—

Major BURNS. We would not be in on that at all.

The CHAIRMAN. Would have no authority to act. But whether we would injure any fertilizer company engaged in producing would depend on how cheaply we made this.

Major BURNS. Yes, sir; it would.

The CHAIRMAN. It would not necessarily follow that we would injure any of the fertilizer companies. But suppose it was demonstrated that there was a sort of a trust in the fertilizer business, and realizing that agriculture must have fertilizer—and even in time of war we have to produce food or we can not live—and the Government went into it to the extent not to drive anybody out of business, but would charge enough for it so as to let everybody else live if they were doing an honest, legitimate business, then your criticism would not apply, would it?

Major BURNS. No, sir.

Senator MCKINLEY. Suppose somebody came along and offered you a million dollars a year for your power.

The CHAIRMAN. It would be a question that we would have to consider as to whether it would be better to take that money or whether we should do like they do in Australia. When the Government there finds any bunch of fellows are monopolizing anything and charging exorbitant rates, they simply go into the business themselves, not to drive others out but just to regulate them, and they claim they regulate them cheaper than we do by laws.

Senator HEFLIN. It is claimed, Mr. Chairman, if Mr. Ford makes fertilizer at Muscle Shoals, the competition that he may bring against those who already

manufacture it would cause a saving of a hundred million dollars a year to the farmers of the United States. If that is so, I think the Government would be justified in having fertilizers made rather than selling the power for a million dollars.

The CHAIRMAN. Of course, that would be a question of policy as to whether we would better sell it to somebody or make fertilizer, or something else.

Senator MCKINLEY. Suppose you were able to make fertilizer there at \$50 a ton. I was just wondering how you would save the hundred million dollars, if we made \$5,000,000 worth of fertilizer?

Major BURNS. You could make about 200,000 tons of ammonium sulphate at United States nitrate plant No. 2, which is the fertilizer item.

Senator HEFLIN. How many tons of fertilizer?

Major BURNS. That plant would supply the nitrogen only.

Senator MCKINLEY. You have to have other ingredients. It is made out of blood and things from the Beef Trust.

The CHAIRMAN. If we wanted to sell this power to somebody else to use in time of peace, we would always have to put in the contract that the contract would terminate immediately in time of war or when the President or other officials thought that there was danger of war?

Major BURNS. Yes, sir.

The CHAIRMAN. And we could not expect any private person or corporation to pay the same price for this power that we would turn over to them with that kind of a stipulation in the contract as we could if we had a definite period of years that we could sell it, because it might happen that they would be right in the middle of some important development and the entire power would be taken away from them.

Major BURNS. Of course Congress has answered that problem, I think, very well. I think the national defense act allows the War Department to commandeer any plant that is necessary—

The CHAIRMAN. Oh, yes.

Major BURNS. I think when you do commandeer you have to pay the necessary damages to the party controlling the plant.

The CHAIRMAN. We might have to. If we would do as suggested by Senator McKinley, instead of utilizing this, for instance, by the Government, to make fertilizer, we sold it, leased it to somebody, and they gave us a hundred million dollars, we might have to pay them more damages if we cancelled that contract, than we were getting, and, as a matter of fact, it might mean greater damages to the person who got it, and it might be that they were perfectly honest and honestly entitled to damages.

Major BURNS. Yes, sir. That would depend on the conditions.

Senator KENDRICK. What proportion of the primary power at Muscle Shoals would be required to run that Muscle Shoals plant?

Major BURNS. We would use practically all of the primary power of Wilson Dam to run that plant if we operated with primary power, but it is my judgment that No. 2 plant can be operated economically with the first 100,000 of secondary horsepower.

Senator KENDRICK. It could?

Major BURNS. Yes, sir.

Senator KENDRICK. That would leave nearly all of the primary power available for commercial use?

Major BURNS. Yes, sir.

The CHAIRMAN. In other words, you would utilize the steam plant to help out the secondary power?

Major BURNS. Not necessarily. I really believe that the steam power plant ought to be considered as a part of the Wilson Dam. Then I think the cyanamid plant can well take its power from a combination of the Wilson Dam and the steam power plant No. 2; and I believe that the big bulk of the work at the cyanamid plant could be done with the first 100,000 of the secondary power. There would be a portion of the work that would have to be taken care of by primary power.

The reason I think that can be done is this: Over 90 per cent of all the power consumed in the cyanamid process is used in the calcium carbide part of the plant, and up to that part of the plant you only use about one-third of the labor. So that if you used secondary power to include the carbide part and used primary power from there on you would use cheap power, and at the same time you would not have any great burden from the lay off of men.

The CHAIRMAN. You would not be able to operate all the time, though, would you?

Major BURNS. You could, at an average yearly production rate of 80 per cent of the capacity of the plant. You would have to put up some storage warehouses to take care of the calcium carbide, and that would, in turn, feed the rest of the plant during the remainder of the 12 months of the year.

The CHAIRMAN. That makes it perfectly plain. It would mean that the making of the calcium carbide part of it would be suspended part of the time?

Major BURNS. Yes, sir; that is correct.

The CHAIRMAN. But when you were making that you could make it faster than the balance of the plant could utilize it, so you could store it up.

Major BURNS. Yes, sir.

Senator McKINLEY. You believe you could do that for 10 months of the year?

Major BURNS. Yes, sir.

The CHAIRMAN. Colonel Barden, have you got those figures?

Colonel BARDEN. I was just figuring on the primary power on the same basis as I figured the other day. The operation of the steam plant at nitrate plant No. 2 to convert a portion of the secondary power of the dam into primary power makes a total of 167,300 horsepower per year primary power, and all of the secondary power going in for nothing. On that basis it would be about a little less than 2 mills per kilowatt hour, omitting the 4 per cent interest.

The CHAIRMAN. The question I propounded, Colonel, to Major Burns was this: Assuming, now, from the standpoint of the manufacture of fertilizer, the power at the Wilson Dam costs nothing; that the only expense is the expense of installing necessary machinery that must be used to make fertilizer as distinguished from explosives, then how cheaply could you make fertilizer?

Colonel BARDEN. In the figures I used the other day I assumed that the annual cost of operation of the dam is 9 per cent, of which 4 per cent was interest on the money put in it and 5 per cent was actual cost of operation, depreciation, and obsolescence of the plant. So if I correctly understand your question now, all that I could cut out of that estimate would be the 4 per cent for interest and the 5 per cent—

The CHAIRMAN. Why not part of that 5 per cent for obsolescence that would take place if you did not operate the plant anyway; and if so, how much of it?

Colonel BARDEN. I would have to know how you wanted me to figure it in order to give a correct answer.

The CHAIRMAN. The point I want to reach, Colonel, is this: Assuming, as from the testimony of Major Burns I do assume, that we are going to maintain this plant No. 2 and the steam plant connected with it, and the Wilson Dam; assuming we are going to maintain all those things as a war proposition, we are going to keep them in such condition all the time so that we could start up immediately; now, then, utilizing that power and that machinery—

Senator HEFLIN. While it is idle.

The CHAIRMAN. While it is idle, for making fertilizer: the only cost you have to add to it now is the necessary machinery, which I understand is quite a little item, of installing fertilizer machinery as distinguished from the other machinery that is there now; then what would it cost to make fertilizer?

Colonel BARDEN. Well, I could only give you the cost of power.

The CHAIRMAN. Well the cost of the power?

Colonel BARDEN. You would have to operate the steam plant for a certain portion of the year, of course, if you assume that the dam would be maintained, under any circumstances.

The CHAIRMAN. I do. I assume that.

Colonel BARDEN. Then I assume that the cost you would want to charge to the fertilizer would be only the cost of operating the steam plant a portion of the year.

Senator KENDRICK. And operating the fertilizer plant under secondary power? Is that the idea?

The CHAIRMAN. No. I want to use the primary power.

Senator McKINLEY. You have to use your steam power. You have to operate your turbines and dynamos.

Major BURNS. No. 2 nitrate plant can be operated practically all the time without the steam plant, with power from Wilson Dam.

The CHAIRMAN. Yes.

Major BURNS. So that would immediately eliminate any discussion of the steam plant.

The CHAIRMAN. You could do that with the fertilizer. You would not need to use the steam plant at all.

Major BURNS. No, sir.

The CHAIRMAN. Your power to make fertilizer would really cost you nothing, would it?

Colonel BARDEN. Just the additional expense of operation over what would be the expense of maintenance—

The CHAIRMAN. Yes, sir.

Colonel BARDEN. And I presume that would be perhaps not over \$100,000 a year.

The CHAIRMAN. That would pretty nearly reduce your—

Colonel BARDEN. Your power would be a very small amount.

The CHAIRMAN. That would put it down to less than one-tenth of a mill, wouldn't it?

Colonel BARDEN. It would be almost negligible.

Senator MCKINLEY. The trouble is you would have somebody coming along and making an offer of about 2 mills for the power.

The CHAIRMAN. Yes; I know that.

Senator MCKINLEY. And then you would have to answer that.

The CHAIRMAN. And maybe you would have to accept that. But you would always have to consider, Senator, when they made that kind of an offer, that you would have to reserve the right to cut that contract off at a moment's notice, consequently they would not be able to pay you the commercial price.

Senator HEFLIN. We are trying to get what it would cost to produce fertilizer under those conditions.

Major BURNS. I can calculate that and show you the basis of the calculation and submit it for the record.

(The estimate follows:)

ESTIMATES OF COST OF PRODUCING NITROGEN FERTILIZER MATERIALS AT UNITED STATES NITRATE PLANT NO. 2.

These estimates do not include any allowance for interest on capital, depreciation, and obsolescence, or taxes and insurance. Additional capital of some \$10,000,000 would be required to convert the No. 2 plant into a fertilizer plant and to operate it as such.

I. Ammonia.¹

Material.	Quantity per ton of ammonia.	Unit cost.	Cost per ton of ammonia.
Power.....	11,432 kilowatt-hours....	\$0.001	\$11.43
Limestone.....	7.05 tons.....	1.25	8.81
Coke.....	2.17 tons.....	6.00	13.02
Coal.....	0.84 tons.....	4.00	3.36
Electrodes.....	132.15 pounds.....	.05	7.61
Soda ash.....	0.134 ton.....	25.00	3.35
Steam.....	8,000 cubic feet.....	.285	2.28
Repair parts.....			5.14
Miscellaneous materials.....			6.36
Labor.....			33.74
Plant overhead (superintendence, office force, fire and police protection, etc.).			12.00
			107.10
Royalties:			
American Cyanamid Co. ²			24.70
Air Reduction Co. ³			2.24
			26.94
Total cost per ton.....			134.04

¹ No charge is included for shipping containers or sales expenses, as it is not assumed that ammonia would be sold as such.

² In accordance with contract, royalties of American Cyanamid Co. amount to \$30 per ton of nitrogen fixed, but are subject to arbitration upon request of either party.

³ Royalty to Air Reduction Co. until January, 1931, is \$2.74 per ton of nitrogen fixed; after that date there is no royalty charge.

II. Ammonium sulphate.¹

Material.	Quantity per ton of sulphate.	Unit cost.	Cost per ton of sulphate.
Power.....	2,972 kilowatt hours.....	\$0.001	\$2.97
Limestone.....	1.82 tons.....	1.25	2.27
Coke.....	0.558 ton.....	6.00	3.35
Coal.....	0.218 ton.....	4.00	0.87
Electrodes.....	39.2 pounds.....	0.05	1.96
Sulphuric acid.....	0.96 ton.....	10.00	9.60
Miscellaneous materials.....			5.20
Labor.....			12.01
Plant overhead (superintendence, office force, fire and police protection, etc.).			4.50
Bagging (assuming 65 per cent shipped bulk).....			.50
Total.....			43.23
Royalties:			
American Cyanamid Co. ²			6.18
Air Reduction Co. ³			2.62
Total.....			8.80
Total cost per ton.....			52.03

¹ No charge is included for sales expense.

² In accordance with contract royalties of American Cyanamid Co. are subject to arbitration upon request of either party.

³ Royalty to Air Reduction Co. discontinues after January, 1931.

Sulphate of ammonia is the material which with present knowledge could be produced to the best advantage for use in fertilizer. Chilean nitrate contains 15 per cent of nitrogen and sulphate of ammonia about 20 per cent, and the prices of the two materials are ordinarily proportionate to the nitrogen they contain. Chilean nitrate at \$50 per ton is about equivalent to sulphate of ammonia at \$66.60 per ton.

The CHAIRMAN. All right.

Major BURNS. But it would cost approximately \$48 per ton of ammonium sulphate, even though the power costs nothing.

Senator HEFLIN. How many tons of fertilizer would that make?

Major BURNS. That would produce about 200,000 tons of ammonium sulphate, which would, in turn, give you the nitrogen content only for some 2,000,000 tons of fertilizer.

Senator HEFLIN. Out of that 1 ton?

Major BURNS. No; out of the whole.

Senator HEFLIN. I asked you how many tons of fertilizer would be made out of that 1 ton?

Major BURNS. It would be fifty times that.

Senator MCKINLEY. Not of ammonium sulphate?

Major BURNS. No, sir. The Senator understands that fertilizer includes phosphoric acid, potash, and nitrogen. The percentage of nitrogen in complete fertilizer is approximately 2 per cent only.

Senator HEFLIN. So this 1 ton you use would produce 50 tons of fertilizer? You said fifty times that?

Major BURNS. That is wrong. It would be ten times.

Senator HEFLIN. It would be 10 tons, then?

Major BURNS. It would be the nitrogen for 10 tons of fertilizer.

The CHAIRMAN. Major, is it your judgment that the Government ought to scrap nitrate plant No. 1?

Major BURNS. Yes, sir.

The CHAIRMAN. You think it ought to be done?

Major BURNS. Yes, sir; unless the Government is going to continue the development for the purpose of developing fertilizers. We are prepared, from a war standpoint, without the development of nitrate plant No. 1.

The CHAIRMAN. Now, I asked you that question as a preliminary to what you have almost answered now that I have in mind. Notwithstanding the fact that you think that ought to be scrapped, you do believe, from your investigation and your knowledge of the chemical situation, that the prospect for improve-

ment in the making of fertilizer or explosives lies rather in the Haber process than in the cyanamid process?

Major BURNS. Yes, sir.

The CHAIRMAN. Now, then, we ought to be just as anxious to improve a method of making fertilizer for war as for peace, ought we not?

Major BURNS. There is quite a difference between the two.

The CHAIRMAN. I know there is, but if we want to make it as cheaply as we can, whether it is during war or peace, we ought to do that to save as much money as we can?

Major BURNS. Yes, sir; that is true.

The CHAIRMAN. If the Haber process is the one that seems to offer to the scientific men a road to economy in the manufacture of nitrate, why should we scrap it and throw it away?

Major BURNS. The Ordnance Department would not be in favor of it at all except for the fact that the Atmospheric Nitrogen Corporation has satisfactorily developed the Haber process at their Syracuse plant, so that process is an established fact in America, and if we had to duplicate plants we could use their organization and their knowledge for the construction of the Haber process.

The CHAIRMAN. Your theory is, then, that private parties have gotten hold of that—

Major BURNS. And have done what we set out to do.

The CHAIRMAN. That through our work down there we have enabled private parties or corporations to go ahead and make a success of it?

Major BURNS. Yes, sir.

The CHAIRMAN. And you think we could depend on that for our supplies?

Major BURNS. Yes, sir; that is correct.

Senator KENDRICK. Major Burns, I wanted to ask you another question about this power.

I understood you to say it would be more satisfactory and even more economical in the maintenance of that cyanamid plant if it were operated at least part of the year than to allow it to stand in idleness?

Major BURNS. Yes, sir; I think that is true.

Senator KENDRICK. Then, assuming that the Government would want to operate it, it would find it possible to do so without any obligation to keep it going any particular length of time, would it not? Suppose it was producing fertilizer, it could discontinue operations at any time it wanted to do so, and not violate any contract with anybody?

Major BURNS. In my judgment it could; yes, sir.

Senator KENDRICK. Under those circumstances, would it not be a great deal the most economical way to dispose of the primary power of that dam and to use in large measure the secondary power in the production of fertilizer; and, at the same time, it would be more economical and more satisfactory for the Government to do that, because of the fact that it could suspend operations without regard to obligations?

Major BURNS. I think that would be a very good solution of the problem, namely, to use the primary power for industrial purposes, and use the secondary power for the time being, at least, for the operation of that plant.

Senator KENDRICK. Yes. In other words, manufacturing, commercial enterprises, would not care for the secondary power so much, because it is uncertain; but it would fit into the Government's plans almost as well as the primary power?

Major BURNS. Yes, sir; I think that is true.

Senator KENDRICK. And prove a highly economical use?

Major BURNS. Yes, sir; that is true.

The CHAIRMAN. Now, Major, what about the nitrates that we use for the Army and Navy in time of peace? Would that be sufficient to be taken into consideration?

Major BURNS. No, sir; it is not much.

The CHAIRMAN. It is too small?

Major BURNS. Yes, sir.

Senator HEFLIN. Major, suppose you would charge the money invested in nitrate plants at Muscle Shoals to war purposes and the money invested in building a dam for creation of power for war purposes, and you undertook the manufacture of fertilizer, as the chairman stated in the outset, without figuring any cost of construction at all, can we produce fertilizer in competition with commercial fertilizer?

Major BURNS. The margin is very slight between sulphate of ammonia produced in the No. 2 plant and commercial fertilizer. As I told the chairman, I think you could manufacture ammonium-sulphate for about \$48 a ton without usual overhead charges and with power costing nothing. The present market price of ammonium sulphate is some \$55 to \$60 a ton.

Senator HEFLIN. You could certainly produce that in competition?

Major BURNS. I have not included in that any charge against capital. Now, you have to include additional capital in order to make a fertilizer plant of it. You would have to spend probably \$10,000,000 for the rounding out of the No. 2 plant so that it would be a fertilizer plant. The interest charges on that sum might amount to a dollar or two a ton.

Senator MCKINLEY. It would amount to \$5, would it not, if you count the earning power? Five per cent of 10,000,000 is 500,000, and you would make 100,000 tons?

Major BURNS. No; it would be 200,000 tons of sulphate. On that basis the interest charges would be \$2.50 per ton.

Senator HEFLIN. Would not that annual production have a very good effect in bringing down the price of commercial fertilizer?

Major BURNS. I don't think it would affect the price very much at the present time, but, as I stated yesterday, it would have the effect of stabilizing it, because it would eliminate some of the peaks in prices which come along from time to time.

Senator HEFLIN. Which would benefit the farmer who has to buy it?

Major BURNS. Yes, sir. It was only two years ago, when we were before the committee before, that ammonium sulphate was selling at \$150 a ton. During this depression it got down to about \$40 a ton. At the present time it is up to \$55 to \$60 a ton. Its average pre-war price was about \$60 a ton.

Senator HEFLIN. If the Government should produce fertilizers there, or Mr. Ford should produce fertilizers there, and the Government should find out how much it cost to produce them, would not that enable the Government to regulate the Fertilizer Trust in the United States and get at the matter of what it costs to produce it and what sort of profit ought to be permitted?

Major BURNS. It would assist slightly, but I would like to make this statement, Senator, that the question of the Fertilizer Trust has been before the public for a long while, and I believe it was in accordance with some bill passed by Congress that an investigation of the Fertilizer Trust was made along about 1913 or 1914. As a result of that investigation, as I recall, the investigators felt that the fear of the Fertilizer Trust was more or less unfounded, and that the fertilizer people were playing a fair game; they were not making undue profits. They were, however, carrying on certain practices that received slight condemnation. They had many brands of fertilizer that were all about the same, but they were marked differently, and they had the effect of fooling a great many people, because a farmer would learn of a certain brand of fertilizer and he would always want it, and it only. Another brand that was of exactly the same chemical composition but of a different name he would not take, because he had tried out the first and it worked satisfactorily, and he might have tried out the second under conditions which were not quite so favorable, and he did not get as good results. He always thought the Black Hawk fertilizer—if that happened to be the brand—was the very best in the world.

Senator HEFLIN. If that committee found there was no Fertilizer Trust, it had been hypnotized.

Major BURNS. I don't know about that, sir. It was the Federal Trade Commission.

Senator MCKINLEY. Probably Wall Street had something to do with it.

Senator HEFLIN. Wall Street has a hand in everything.

Senator KENDRICK. Mr. Chairman, I want to ask the witness what rate of interest the primary power of this dam, if sold at a commercial rate, would return on the total cost of the dam?

Major BURNS. I could figure that out and submit it.

Senator KENDRICK. Colonel Barden, have you an answer to that question?

Colonel BARDEN. I have a statement here about that somewhere. I made the statement that if the dam was completed with the eight-unit installation—

The CHAIRMAN. That would be how many horsepower?

Colonel BARDEN. That would be 240,000 horsepower. That if the primary power were sold on a 60 per cent load factor at 3 mills per kilowatt hour, and the secondary power sold on the same load factor at 1.16 mills per kilowatt hour—

Senator KENDRICK. Which would be about the commercial rate?

Colonel BARDEN. Well, yes. That the total annual income would be \$1,542,500, which is approximately 7 per cent on the \$23,177,000 which we estimated would be the cost of completion.

Senator KENDRICK. To complete the dam?

Colonel BARDEN. To complete the dam; yes, sir.

Senator KENDRICK. And do you recall, offhand, what the investment in the dam is up to this time?

Colonel BARDEN. The total investment would be, including what is already in, and what it would cost to complete it, in round figures \$45,000,000; and this would be only about 3 per cent, or between 3 per cent and 4 per cent on that figure.

Senator KENDRICK. The total cost of power is somewhat higher, and that would bring the income on the investment in the dam up to about 4 per cent or 5 per cent?

Colonel BARDEN. My feeling is, Senator, that if Dam No. 2 were completed by the Government and the power sold, it would yield a return of probably certainly 4 per cent on the cost of completion, and that in the course of 10 or 15 or 20 years, as the demand for power increased and the price of power would probably increase, we could not only pay a rate of interest on the money spent to complete it, but also some interest on the money that is already in it.

Senator KENDRICK. And, in addition to that, based on the statement just made by Major Burns, would it not be possible, for instance, for the Government to have sufficient secondary power to go on and manufacture nitrates to meet the needs of the Government and for fertilizer purposes as well?

Colonel BARDEN. Well, sir, of course my figures were based on the assumption that the secondary power would be sold.

Senator KENDRICK. You only figure on 250,000 altogether?

Colonel BARDEN. Yes, sir.

Senator KENDRICK. Now, as I understand it, there would be very much more secondary power for a great part of the year?

Colonel BARDEN. Yes, sir. It is hard to say what will happen in the future. We feel that the demand for power in the southern territory in the next five to seven years would be sufficient to use all the power, absorb all the power that would be developed at this dam.

Senator KENDRICK. Without regard to the secondary power?

Colonel BARDEN. We would expect to operate the steam plant if necessary to convert a portion of the secondary power into primary, and probably additional secondary power could be sold to other concerns that had steam plants of their own.

Senator KENDRICK. Do you happen to recall or have in mind what that secondary power amounts to and during what period of the year it is available?

Colonel BARDEN. Yes, sir.

The CHAIRMAN. I think that is all in the record.

Senator KENDRICK. Well, I have not found it possible to be here all the time, and I did not happen to be here when that testimony was given. I would like to have that information.

Colonel BARDEN. I have figured 87,300 as the primary horsepower, and then 141,000 horsepower available for 10 months of the year; 205,000 horsepower available for 8 months of the year; 305,600 horsepower available for 6 months of the year, and 600,000 horsepower available for 2½ months.

Senator McKINLEY. That is all in the record.

The CHAIRMAN. Now, Major Burns, you have given it as your judgment that the Government ought to scrap nitrate plant No. 1, because the process has been developed and brought to such a stage of development that the Government could go ahead and manufacture by it in case of need.

Major BURNS. Yes, sir.

The CHAIRMAN. Now, nitrate plant No. 2 has been developed to be a success and in good shape all the way through?

Major BURNS. Yes, sir.

The CHAIRMAN. Why don't you scrap that also?

Major BURNS. Because, as I tried to show you from the curves, in order to meet our war demands we must have a sufficient quantity of stock plus facilities. The No. 2 plant is a very important facility and has a very great poten-

tial value for producing fixed nitrogen. The No. 1 plant, as it stands to-day, has no—

The CHAIRMAN. You would have to put some improvement on it?

Major BURNS. Yes, sir. You would have to put in about \$4,000,000.

Senator McKINLEY. It has scrapped itself. Is not that right? It is not a workable plant?

The CHAIRMAN. Oh, no; it is not entirely scrap. It has about \$13,000,000 worth of machinery in it, but about \$5,000,000 would have to be scrapped. Is not that right?

Senator McKINLEY. No.

Major BURNS. Putting it another way, it would cost about \$4,000,000 to make that plant work, as we figure it.

The CHAIRMAN. Yes; well, I have figured it at five million.

Major BURNS. And the plant cost \$13,000,000.

Senator McKINLEY. Oh, well, that is different.

Major BURNS. But the reason that the War Department does not argue for that No. 1 process is that that process is a developed commercial enterprise in America to-day.

The CHAIRMAN. So is the other one.

Major BURNS. There is no other cyanamid plant in the United States.

The CHAIRMAN. No; that is true, but I assume the reason it is not developed commercially is because scientific men do not regard it as of merit commercially as compared with the Haber process. Is not that true?

Major BURNS. I think that is partially true.

Senator HEFLIN. Major, I think you said the other day that the majority of this machinery in plant No. 1 could be used for power purposes, as Senator McKinley suggested when we were down there.

Major BURNS. That is correct. I said in order to make that No. 1 plant work you would have to spend about \$4,000,000. You would not have to scrap all you have down there. Many features of the plant you would not have to touch at all. For instance, the plant for producing nitric acid, the plant for concentrating nitric acid, the plant for making ammonium nitrate are all right. You would not have to touch them at all.

Senator HEFLIN. How much is that worth?

Major BURNS. About \$6,000,000.

Senator McKINLEY. Now?

Major BURNS. That is what it cost.

Senator McKINLEY. Not what it cost. We ought to throw away a lot of it and charge it up to the war.

Major BURNS. I can not tell you what it is worth. That is what it cost.

Senator HEFLIN. That part, you say, is worth \$7,000,000, of which one-half would not have to be changed at all?

Major BURNS. No, sir; the plant would be of no use to you as a fertilizer plant unless it was modified.

Senator HEFLIN. Major, when Dam No. 3 is completed, the Wilson Dam, and No. 1 is put in running order, the cyanamid plant completed and the Haber plant, how much money will have been expended thereon?

Major BURNS. It would take \$23,000,000 to complete No. 2 dam, as I understand it.

Senator HEFLIN. Wilson Dam?

Major BURNS. It would take \$25,000,000 to complete No. 3 dam. You have got to add the No. 1 dam.

The CHAIRMAN. No.

Major BURNS. You did not mention No. 1?

Senator McKINLEY. He meant No. 1 plant, the \$4,000,000 for that.

The CHAIRMAN. He does not mean No. 1 dam. That is entirely a navigation plant.

Colonel BARDEN. The cost of Dam No. 2 is \$28,000,000?

Major BURNS. \$28,000,000.

Colonel BARDEN. That is for eight units.

Major BURNS. That would be twenty-eight plus twenty-three plus four, or \$55,000,000.

Senator HEFLIN. Then, with the plants added to that, what will the Government have expended then?

Major BURNS. \$160,000,000.

Senator HEFLIN. \$160,000,000?

Major BURNS. Yes, sir.

Senator HEFLIN. Now then, Mr. Chairman, it is claimed that the power that would be produced there would mean a saving of 6,500,000 tons of coal annually, and that at \$3 per ton that would be \$19,500,000. In three years \$57,500,000 worth of coal would be saved, and at \$100,000,000 a year in fertilizer saved to the farmers in the price of fertilizer, would be \$300,000,000 additional. So there is three hundred and fifty-odd million dollars saved, and the Government will have expended how much did you say?

Major BURNS. \$160,000,000.

The CHAIRMAN. We will adjourn at this time until 10.30 o'clock Monday morning.

(Whereupon at 11.45 o'clock a. m. the hearing was adjourned to 10.30 o'clock a. m., Monday, April 17, 1922.)

MUSCLE SHOALS.

MONDAY, APRIL 17, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris (chairman) presiding.

Present: Senators Norris, McKinley, Capper, Gooding, Ladd, Norbeck, Harreld, Kendrick, Harrison, and Heflin.

The CHAIRMAN. The committee will come to order.

We were to start in with the Alabama Power Co. proposal this morning, I believe.

Senator HEFLIN. Mr. Chairman, Mr. Martin is here. I suppose he wants to be heard, or he will state the names of those that he desires to speak.

The CHAIRMAN. All right, Mr. Martin.

STATEMENT OF MR. THOMAS W. MARTIN, PRESIDENT ALABAMA POWER CO., BIRMINGHAM, ALA.

Mr. MARTIN. Under date of February 15, 1922, the Alabama Power Co. submitted an offer to the Secretary of War by which the Wilson Dam at Muscle Shoals might be completed, and the nitrate problem of the Government in connection therewith simplified without further advances or expenditures by the United States. That proposal, accompanied by a letter of explanation from this company of its plan, was in turn submitted by the Secretary of War to the Congress on February 21, 1922.

I understand, Mr. Chairman, that I am to take up the merits of this proposal as presented by the Alabama Power Co.

The CHAIRMAN. Well, Mr. Martin, would it not be well at this point in your testimony to put in the record your written proposal and the recommendation also? I would suggest that you put them in.

Mr. MARTIN. I will offer here the letter of transmittal to the Senate, together with the proposal.

(The documents referred to are as follows:)

[House Document No. 192, Sixty-seventh Congress, second session.]

WAR DEPARTMENT,
Washington, February 21, 1922.

DEAR MR. SPEAKER: I forward herewith an offer, which I think worthy of consideration, made by the Alabama Power Co., proposing to complete the Wilson Dam at Muscle Shoals and to administer the Government's property at that point, which I think should be referred to the committee having jurisdiction over this subject. This offer is accompanied by a letter of explanation.

My comments on this offer are as follows:

1. The company will take out a license under the Federal water power act to complete the dam, locks, and power house, at its own expense, with initial installation of approximately 240,000 horsepower, subsequent installation to be made as required by the Federal water power act to meet market demands. This has the advantage of relieving the Government of all further expenditures in connection with completing these structures.

2. The company offers to furnish the Government, or anyone it may designate, with free power in the amount of 100,000 secondary horsepower for the

production of fertilizer and munitions of war and research in connection therewith; and if for any reason this use of the power is discontinued the company will purchase same. This feature of the offer has the advantage of providing the Government a return on the \$17,000,000 it now has invested in the water-power project.

3. The Government has an interest in the Warrior extension of the steam plant of the power company and certain other facilities and it owns the steam plant at nitrate plant No. 2, all of which the company offers to purchase for \$5,000,000, less an amount to be agreed on to cover costs of locks and navigation structures at the Wilson Dam, which would be approximately two and a half millions of dollars, thus realizing a substantial sum on the Government's war-time investment in these steam plant facilities and at the same time placing them in the public service.

4. It is important here to note that the effect of this offer is to leave the Government in ownership of its two nitrate plants in the Muscle Shoals district, together with the Waco quarry, representing a war-time investment of some \$75,000,000. They may be retained or they may be disposed of by lease, or otherwise, for the manufacture of nitrates, for munitions of war, or fertilizer.

5. The power company offers to operate and maintain the dam, power plant, and gates. There is a distinct advantage to the Government in this part of the offer. In the period of 50 years there may be occasion for substantial repairs and maintenance to the dam and gates as well as the power plant.

6. By the terms of this offer, the Wilson Dam property will be transferred to the licensee, who will complete the construction. The locks and navigation structures, when completed, are to be conveyed to the Government in fee. This feature of the offer has the advantage that it brings the entire property represented by the Wilson Dam project under local taxation laws.

7. The offer contains the further provision, based on section 16 of the Federal water power act, for taking over and operating the water-power project by the United States, whenever the safety of the United States demands, for the manufacture of nitrates, explosives, or munitions of war, or for any other purposes involving the safety of the United States. This broad provision of the act is of special importance to the United States in view of the location of the nitrate plants at this community.

8. It is proposed by the power company to develop this project under the Federal water power act which limits the license to a 50-year term. There is reserved, by section 14 of the act, the right to recapture by the Government at the end of that period, and if not so taken over by the Government, then the State and municipalities have preference over others. In this important respect the offer conforms to our national policy.

9. The company agrees to begin construction promptly and complete the same within a reasonable time. The construction must be begun and completed within the time prescribed in the license. If not begun, the license may be terminated upon order of the Water Power Commission; and if not completed, there is ample provision for protecting the rights of the Government in the situation. In addition, however, it is in the province of the Federal Power Commission to require such assurances and guaranties as may be necessary as to the financial ability of the licensee to complete its undertaking.

10. The Alabama Power Co. is a public utility. By the terms of the Federal water power act, its rates, service, and security issues are regulated by local authority, and if none exists, by the Federal Power Commission. These regulatory laws all provide for service to everyone without discrimination.

11. The Acting Judge Advocate General has expressed the opinion that the option claimed by the Air Nitrates Corporation under its contract is not a lawful option. If valid, it is an option on the plant as an entirety. It is believed that nothing in the option prevents substitutions in parts of the plant believed by the Government to be desirable. This offer substitutes power in amounts sufficient for the efficient operation of the plant for a plant to produce this power and no injury is done to the nitrate plant as a whole. Moreover, the Air Nitrates Corporation option arises only in case the United States determines to dispose of the plant as an entirety. Accordingly, even if the option is valid, it would seem not to interfere with the acceptance of this offer.

12. This offer makes no provision for Dam No. 3. To provide for the local requirements there is probably no necessity for the construction of this dam at this time, but in case the local demand and the requirements of navigation

develop, there would be no difficulty in providing for the financing of Dam No. 3 on reasonably fair terms.

Yours very truly,

JOHN W. WEEKS,
Secretary of War.

The SPEAKER OF THE HOUSE OF REPRESENTATIVES.

ALABAMA POWER CO.,
Birmingham, Ala., February 15, 1922.

Hon. JOHN W. WEEKS,
Secretary of War, Washington, D. C.

SIR: This company offers to carry out the following plan by which the Wilson Dam at Muscle Shoals may be completed and the nitrate problem of the Government in connection therewith may be simplified without further advances or expenditures by the United States.

1. To take out a license under the Federal water power act under which we will complete the construction of the dam, locks, and power house at Muscle Shoals, known as Wilson Dam, or Dam No. 2, at our own expense, with initial installation of approximately 240,000 horsepower, subsequent installation to be made in accordance with the Federal water power act as may be necessary to meet the market demands.

2. To furnish free to the Government, or anyone it may designate, from the hydropower plant 100,000 horsepower as required for the production of fertilizers and munitions of war and for research in connection therewith; and if, due to changes in the art, this use of such 100,000 horsepower is discontinued by the Government, the Alabama Power Co. to purchase and pay for same in accordance with a schedule to be set forth in the license. This power to be the second 100,000 horsepower at any time available from the normal flow of the river.

3. To purchase the Government's interest in the Warrior extension of the steam plant of Alabama Power Co. and facilities, the Warrior and Sheffield substations, the transmission line from Warrior to Sheffield, and the steam plant at nitrate plant No. 2, together with the necessary rights of way, lands, and housing facilities, and to pay therefor in five equal installments the sum of \$5,000,000, less an amount to be agreed on to cover the cost of locks and navigation structures at Wilson Dam, the first payment to be made when license is granted, the remaining payments to be made in four equal annual installments with interest at 5 per cent, with the right to anticipate any part or all of same.

4. To operate and maintain the power plant, dam, and gates, the Government to operate and maintain the locks for which the power company will supply the necessary power without expense to the Government.

5. The Government to transfer to the licensee the Wilson Dam property represented by its investment and commitments to date, free of liabilities and unencumbered, including the construction plant. The locks and navigation structures to be conveyed to the Government in fee on completion of construction.

6. Whenever the safety of the United States demands, the United States shall have the right, as more fully provided in the Federal water power act, to take over and operate the project covered by the license for the purpose of manufacturing nitrates, explosives, or munitions of war, or for any other purposes involving the safety of the United States for such length of time as may appear to the President necessary for such purposes.

7. The project covered by the license to be subject to recapture by the Government at the end of 50 years under the terms of the Federal water power act.

8. The licensee will agree to begin the construction promptly upon the enactment of the necessary legislation and granting of license and to complete the same within a reasonable time thereafter.

To facilitate the carrying out of this plan, we may find it necessary to organize a new company for the purpose, in which case, however, the obligations of this offer shall be binding upon this company in all respects as if it were the licensee.

Very respectfully,

ALABAMA POWER CO.,
By THOS. W. MARTIN, *President.*

ALABAMA POWER Co..

Birmingham, Ala., February 15, 1922.

Hon. JOHN W. WEEKS,
Secretary of War, Washington, D. C.

SIR: In accordance with the offer which we have to-day submitted to you with reference to completing the Wilson Dam at Muscle Shoals, we beg to make the following statement:

For many years the Alabama Power Co. has been serving electricity to the industries and the public in Alabama. It is an Alabama corporation, having several thousand stockholders in Alabama. It has now more than 17,000 customers and serves more than 50 municipalities. It has more than 1,500 miles of transmission lines, an installed electric generating capacity of 175,000 horsepower and is engaged in constructing a new hydroelectric plant on the Coosa River of 110,000 horsepower capacity under a 50-year license granted by the Federal Power Commission. Its facilities are now being used to supplement the power supply in Tennessee, Georgia, and South Carolina, and even as far away as North Carolina, 600 miles distant, and can be used in even more distant localities.

For many years this company has been identified with the Muscle Shoals situation. For several years before the war it had owned the site of the Wilson Dam, and at the outbreak of the war it was actually proceeding with plans for a power development at this point. These plans were made with the active cooperation of the engineers of the War Department, and their approval appears in House Document No. 20, Sixty-third Congress, second session, and House Document No. 1264, Sixty-fourth Congress, first session.

After this country entered the war the Government desired the site for war purposes. We thereupon donated the site to the Government and transferred to it for \$1 titles and rights in connection with which we had already spent just under \$500,000.

We still own dam site No. 5 and certain lands in connection therewith.

The Government being also then in need of power beyond our available capacity and time being of the first importance, we in like manner turned over to the Government, upon its request, the use of foundations and underwater structures then in reserve for our own use and enabled the Government to build thereon a 30,000-kilowatt extension to our Warrior River steam plant to be operated in conjunction therewith, and at the same time we placed a right of way owned by the company at the disposal of the Government for building a transmission line from Warrior to Muscle Shoals, a distance of some 90 miles. This enabled the Government to quickly secure the large amount of power required for constructing and operating the nitrate plants at Muscle Shoals. An agreement was signed between the Government and the company in November, 1918, binding the company to purchase this property from the Government after the termination of the war at a fair value.

When in April, 1921, the War Department inquired concerning the feasibility of completing the Muscle Shoals development, we expressed the opinion that the project was an economical and profitable undertaking, and promised that when the Government determined to complete it for commercial purposes the Government might reply upon the cooperation of this company. Recent discussions in Congress indicate that the Government is now prepared to devote this power to industrial uses, and it is, therefore, appropriate for this company now to offer its suggestions.

In formulating our plan we have sought to meet the requirements of the Government, first, in the desire to produce cheap fertilizers; second, to have nitrates available in time of war; third, to contribute to the industrial development of the region both by bringing in new industries and opening up navigation on the Tennessee River; and, finally, to complete the project without further expense to the Government.

Financial conditions have so far improved that we are now able to offer to complete the Wilson Dam and power project without cost to the Government, except for its locks.

We are assured by a number of important industrial enterprises that if the power from this development becomes available to the public they will establish new plants and factories in this locality. This, with the rapid growth of industries in the region which may be economically served—a territory larger than New England—is such that we are confident the entire power output will be promptly absorbed. If the Muscle Shoals power can be made available for every-

body, we believe that not only will a number of new industries be established at and near Muscle Shoals, but the industrial development of Alabama, Tennessee, Georgia, North and South Carolina, and, indeed, of the entire South, will be promoted. Hence our willingness to assume the large responsibilities involved in our offer.

The Government has invested more than \$70,000,000 in the two nitrate plants and the lime quarry, and it appears that one or both of these plants are essential for the production of nitrates for war purposes and useful for fertilizer production. Our proposal leaves the Government in full title and possession of these plants and the quarry, to give it 100,000 horsepower, and from two to five million dollars in cash for the operation thereof and for carrying on experiments in connection therewith. The Government will then be in position to turn over the two plants, with power and money for the operation thereof, to anyone capable of meeting the requirements of the Government and the farmers for nitrates and fertilizers, or the Government may retain the properties and itself carry on such experiments and manufactures as it sees fit. The Government can dispose of the plants in perpetuity for a long period of years or for a short period of years, and it should be able, with the free use of modern plants, no taxes, no power charges, and even with the free use of working capital, to attract the best skill and talent to be found.

The art of producing nitrates is still in its infancy and may so develop that in a few years these plants and this power will not be needed for producing either nitrates for war purposes or fertilizers. Our plan provides that in case the use of the 100,000 horsepower is discontinued by the Government, we will purchase that power from the Government and the proceeds will then be available for any use desired by the Government, including the amortization of its present investment in this situation.

We propose to take a license under the Federal water-power act. This act provides for a 50-year license with the right of the Government to recapture the property at the end of the license period. It requires the licensee to operate and maintain the power plant, dam, and gates at its own expense, to make all necessary renewals and replacements, and it permits the Government to operate and maintain the locks, power to be furnished free for this purpose by the licensee. Of special importance in this situation is the requirement that the licensee shall contribute to the cost of improvements in the headwaters of the river made either by the Government or by another licensee. This insures our cooperation in opening the upper reaches of the river to navigation and improvement.

This great project should be completed and at the earliest possible date coordinated with the power demands of the very extensive territory covering seven States within the reach of power from this source. The maximum value can be drawn from these Tennessee River possibilities only through their coordination with the power and reservoir opportunities on other rivers in Alabama and adjacent States now in process of progressive development in the different watersheds. Such is the conclusion in the report entitled "The power situation during the war," submitted to the Secretary of War in 1921, through the Chief of Engineers, from which we quote as follows:

"150. It therefore appears that a broad and well-founded judgment would dictate that the Muscle Shoals development should be interconnected for exchange of power with the existing power systems of the Southern States, and that this interconnection and exchange should be arranged for without delay, so that future construction, both at Muscle Shoals and elsewhere, can be directed for the production of plants which will supplement each other for economy of construction and operation."

Very respectfully,

ALABAMA POWER CO.,
By THOS. W. MARTIN, *President*.

Mr. MARTIN. Now, Mr. Chairman, do you wish me to explain in substance the merits of the proposal of the Alabama Power Co.?

The CHAIRMAN. I would not want to make any suggestion as to that, Mr. Martin. The committee, of course, will want to consider your proposition in connection with all the other propositions. Use your own judgment as to what you want to say and what explanation you think you ought to make.

Mr. MARTIN. Then, Mr. Chairman, I will briefly explain the offer.

The Alabama Power Co., being a public utility corporation, proposes to take out a license under the Federal water power act of June 10, 1920, under which it

will complete the construction of the dam, lock, and power house at its own expense, with an initial installation of approximately 240,000 horsepower.

The terms of the Federal water-power act are that installations must be made to meet market demands from time to time in accordance with the directions of the Federal Power Commission. That obligation we would assume naturally as one of the conditions of our license.

We have proposed also to furnish the Government free, or to furnish free to anyone designated by the Government, from the hydroelectric plant when completed, 100,000 horsepower as required for the production of fertilizer and munitions of war, and for research in connection with those problems.

We also propose that if the use of this power is discontinued by the Government, due to changes in the art, the power company will purchase and pay for the power in accordance with such schedule as may be set forth in the license.

This power is to be the second 100,000 horsepower at any time available from the normal flow of the river.

Senator KENDRICK. Do you mind interruptions, or would you prefer to continue your statement?

Mr. MARTIN. No, sir. I will be very glad to have them.

Senator KENDRICK. I want to understand you. Now, this is not primary power, this 100,000 horsepower?

Mr. MARTIN. No, sir. We propose that the power company take the first 100,000 of primary power as the basis on which it can undertake this financial burden, and the second 100,000 of power to be available for use by the Government. Now, that power, Senator, is available, according to the charts which I will display to you presently, 84 per cent of the time. The full amount is available 84 per cent of the time, on the average. I will go further into the details of that later, unless you wish me now to go into it.

The CHAIRMAN. I was going to ask, since you say you prefer that we ask you questions as you proceed, do you propose to pay that in case the Government ceases to make fertilizer, due to the changes in the art, or for any other reason?

Mr. MARTIN. Yes, or for any other reason.

The CHAIRMAN. You say you will buy this 100,000 horsepower from the Government on the terms mentioned in the license?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. How is that price going to be determined? What are you going to put in the license?

Mr. MARTIN. That I don't know. That is a matter for the Government; whatever may be determined by the Federal Power Commission to be a fair basis.

The CHAIRMAN. Then you propose, it seems to me, to pay for this 100,000 horsepower, or any part of it that the Government does not use, a price to be determined by the commission?

Mr. MARTIN. Or any board or individual or officer that may have authority to deal with it.

The CHAIRMAN. What board or officer does have authority to deal with it, or will have authority?

Mr. MARTIN. No one except the Federal Power Commission, under the present laws.

The CHAIRMAN. Yes; all right.

Mr. MARTIN. Now, we propose also to purchase the Government's interest in the Warrior extension of the steam plant of the Alabama Power Co. and facilities erected or constructed in behalf of the Government in connection with that plant; also the Warrior-Sheffield substations, the transmission line from the Warrior plant to Sheffield, and the steam plant at nitrate plant No. 2, together with necessary land and houses and facilities in and around the nitrate steam plant to make it an operating plant and to pay therefor in installments the sum of \$5,000,000, less the amount to be agreed upon to cover cost of locks and navigation structures.

The CHAIRMAN. You mean you propose to pay \$5,000,000 in the aggregate?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. In installments?

Mr. MARTIN. Well, either in cash or in installments. We expressed it in our offer in five equal installments.

The CHAIRMAN. Your proposition is that you will give the Government \$5,000,000 for the nitrate plants—

Mr. MARTIN. No, sir.

The CHAIRMAN. For the steam plant, then, at the nitrate plants?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. And the Government's interest in the Gorgas steam plant and the transmission line?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. What else?

Mr. MARTIN. That is all.

Senator KENDRICK. Mr. Chairman, may I ask a question here?

The CHAIRMAN. Yes.

Senator KENDRICK. Are you through with your general statement?

Mr. MARTIN. I am not quite through with the discussion of the terms of the offer.

Senator LADD. If I understand you on one point, you said the \$5,000,000 was less the cost of dams, locks, and so forth?

Mr. MARTIN. Less the amount, whatever may be agreed upon, to cover the cost of locks and navigation structures. The Secretary of War, in reporting to Congress, stated that that cost would be two and a half million dollars.

Senator LADD. Then you would be paying two and a half million dollars?

Mr. MARTIN. There would be an expenditure of \$5,000,000.

Senator LADD. Less two and a half million.

Mr. MARTIN. Whatever it might be. We have assumed that the Government would undertake the construction of the locks, and our offer is to complete the Wilson Dam and the powerhouse.

Senator HEFLIN. You do not include Dam No. 3?

Mr. MARTIN. No, Senator; we have not included that; but so far as Dam No. 3 is concerned, I will make a statement about that presently.

Senator HEFLIN. Before you get away from that proposition about the Government selling this power, if it is not desired to use it for fertilizer purposes, suppose the Government should cease to want it for fertilizer purposes, but should desire to use it for some other purpose, what provision is made in your contract for that?

Mr. MARTIN. Well, we have not expressed this offer in terms of a contract, Senator. If the Government should need this power for some other purpose, I should think that would be a matter that could be expressed in terms of the license contract with the Federal Power Commission.

The CHAIRMAN. I suppose it would be immaterial to you whether the Government used it for fertilizer purposes or any other purpose?

Mr. MARTIN. Yes.

Senator KENDRICK. Suppose the Government would want to retain the steam plants and No. 2 dam to operate in conjunction with its 100,000 secondary power for manufacture of fertilizer or any other product, would that make any difference to you?

Mr. MARTIN. I would express it in this way, Senator:

The obligations which we assume here will approximate twenty-five to thirty million dollars in the course of the development of the project. Now, to assume those obligations we have offered to purchase the steam-plant equipment. There is a certain amount of primary power which we take. The Government takes secondary power. Then there is some remaining secondary power. This proposal of ours couples this whole situation together, and as we have worked it out we feel that the steam plant at Sheffield is necessary, in so far as it can supplement that secondary power.

Senator KENDRICK. Two things are certain about that steam-plant proposition: You could replace that with another one of your own, if you desired to do so. It is also certain that the Government, in order to receive any benefit from this secondary power, would have to subordinate that and support it, in fact, with a steam plant to give them power when they did not have sufficient power from the secondary power.

Mr. MARTIN. That is very true, Senator, unless you would set it up on the basis of witnesses who have, at different times, appeared before the committee to deal with this question of secondary power. They expressed definite views that the secondary power can be used in the manufacture of fertilizer. You might remember that this 100,000 secondary power, some of it, is available all the time. All of it is not available all the time. Some of it is available all the time, with the exception of brief periods—for about 4 years out of 30. That is, in those four years at certain periods of the year none of this power would be available. On the assumption, then, that some of this power is avail-

able all of the time, and its use for fertilizer manufacture being seasonal, two of the witnesses who have appeared before committees here stated that the secondary power could be used commercially in the manufacture of fertilizer. In fact, that was the theory on which the matter was presented to the Congress a year ago—that the primary power should be sold to public utilities and the secondary power should be used in the manufacture of fertilizer. Major Burns testified before you last week that secondary power could be used to operate plant No. 2!

Senator KENDRICK. There are two things involved, of course, in the manufacture of fertilizer, just as in many other industrial enterprises. One of them is the matter of economy, and the next is the question of continued operation. Those are two vitally important things, because of the lost motion that occurs through the suspension of production or loss of your organization, discharging of your men, and all that sort of thing.

Mr. MARTIN. Well, it is a question to what extent that would apply.

Senator KENDRICK. Now, I am not going to take up your time, but I want you to make those points clear.

If the Government were going to operate that nitrate plant itself, which seems to be about the most sensible thing for it to do, and it should accept your offer of secondary power from the dam, it would immediately become necessary to reinforce that with steam power, and it is my judgment that this plant can not be improved upon. It looks to me like one of the best and most sensible pieces of construction that I saw in connection with the Muscle Shoals operation.

Senator MCKINLEY. Will you guarantee 100,000 of the secondary power for 10 months of the year?

Mr. MARTIN. Well, that would be available on the average, Senator. There would be some years when it would not be available.

Senator MCKINLEY. You appreciate the proposition that unless you could give them about 10 months' work you could not hold an organization together?

Mr. MARTIN. Yes.

Gentlemen, there will not be 10 months' power 30 years out of 30. There will be 10 months' power—we have plotted it, Senator, to show just exactly what the record has developed on that. If you wish me to go into that now I can do so.

Senator MCKINLEY. That is what I had in mind. Colonel Barden testified that with the auxiliary steam power there was always there 167,000 prime power, combining the steam and water power. Then, I am under the impression that he thought that there was 200,000 horsepower or more—perhaps 240,000 horsepower for 10 months by reinforcing it with the steam plant.

Mr. MARTIN. Oh, there would be, reinforced with the steam plant, unquestionably; but you asked me the question whether the run of the river would produce—

Senator MCKINLEY. No; I didn't. I asked you whether you would guarantee 100,000 horsepower for 10 months.

Mr. MARTIN. We would have to figure that out, Senator, to see just exactly what that would mean by way of any addition to our proposal.

Senator KENDRICK. The question, Mr. Martin, of the sale of that steam plant by the Government, if in its operations it would require this horsepower itself, would have to be contingent upon a guaranty of this power right along.

The CHAIRMAN. Perhaps not all the time, Senator. I can see a difference between operating a fertilizer plant and running a street railway or lighting a city, where you have to have the power all the time, every day in every year. For two months, on the average, in the year, you could run your plant with less power and you could still operate it to great advantage in making fertilizer, because the business would not be ruined if you should shut down a few days at a time occasionally. It would be better to run all the time, of course.

Senator KENDRICK. Senator McKinley said you would require a 10 months' guaranty.

The CHAIRMAN. I should think there ought to be somewhere in the neighborhood of 10 months, at least, if not 11, because your organization could not be held together on less time than that. If you gave everybody a holiday of 30 days a year, that would, perhaps, be about what would be allowed anyway. If you had it for 10 months, you would give everybody a holiday for two months in the year.

Senator MCKINLEY. As a business proposition, you should give the men at least 10 months' work in the year.

The CHAIRMAN. Yes.

Mr. MARTIN. The greater part of this power at the cyanamide plant is used in the operation of the furnaces. When you come to that question, that could be discontinued and other operations taken up.

The CHAIRMAN. Major Burns has explained to us very clearly that we will be able to operate this plant when we have power and get ahead with one product of the plant and store it up so that when we did not have power enough to run it we could use the stored-up product that had been made. That product was carbide. In other words, the carbide that is necessary in getting nitrogen out of the air under the cyanamid process would exceed in quantity of manufacture the balance of the work, so that we could store up some in advance, and we could stop work on the carbide and go on and would not need the power for manufacture of carbide, but could use it for operation of the rest of the plant.

Mr. MARTIN. Of course in addition to that the steam plant is always going to be there, and it is always, in the working out of a problem of this kind, possible and practicable to develop some plan by which a certain amount of steam power could be available on some basis. That question is one that can be adjusted to meet a condition or the conditions on which you propose to conduct the operation.

Senator KENDRICK. I am sorry to interrupt you, Mr. Martin.

Mr. MARTIN. That is all right, Senator.

I would just like to mention this right here. When the question was up before one of the House committees last year the representatives of the Farm Bureau were testifying on this very question as to the feasibility of using secondary power to manufacture fertilizer at this plant, and it was fully gone into. They expressed the view that the secondary power could be used. Now, in the course of a discussion Mr. Magee, conducting the inquiry, asked these questions:

"Mr. MAGEE. Then if you are going to use the secondary power there would be certain seasons when you could not operate the plant?"

"Mr. BOWER. Yes; at certain seasons.

"Mr. MAGEE. And you would have to shut down and throw out of work 2,000 or 2,500 men?"

"Mr. BOWER. No; you would not shut down altogether and throw out 2,500 on account of the drop in horsepower, because your horsepower requirements at that plant are at the carbide furnaces."

That is the same problem that has been mentioned by the chairman here.

"Mr. MAGEE. You would have to cut down the number of your men?"

"Mr. BOWER. Some of them, for a little while.

"Mr. MAGEE. What proportion would you cut down—50 per cent?"

"Mr. BOWER. Oh, no, sir. It would simply be the men employed around the carbide furnaces, which would be closed temporarily only.

"Mr. MAGEE. You would have to disorganize your organization?"

"Mr. BOWER. My thought would be this: You figure your total labor cost on cyanamide over the year, and you would run 10 months of the year and have a certain amount of labor cost, and then for two months suppose they were idle? It would pay to keep those men. It might add 50 to 75 cents a ton to your cost, but that would be so much cheaper—"

"Mr. MAGEE. When you figure on using the secondary power, when you did not get that power, then you would not operate the plant?"

"Mr. BOWER. Not the total plant; absolutely not."

Then he goes on to explain. I will hand to the secretary here the full conversation on this question before that committee. It might be of interest to you gentlemen to have it.

The CHAIRMAN. All right. Give it to the reporter, to be copied into the record at this point.

(The excerpts referred to are as follows:)

STATEMENTS OF MR. BOWER, OF THE AMERICAN FARM BUREAU, BEFORE SUBCOMMITTEE OF HOUSE COMMITTEE ON APPROPRIATIONS, FEBRUARY 15, 1921.

PRIMARY AND SECONDARY HORSEPOWER.

Mr. MAGEE. Unless you use the primary and secondary horsepowers for this same purpose how are you going to keep your men employed?

Mr. BOWER. The power consumed in this plant is in the carbide furnace, using the secondary power, but the whole 100,000 secondary power is not used—

Mr. MAGEE (interposing). Unless you use the primary power you can not run the year round.

Mr. BOWER. That is the point.

Mr. MAGEE. Can you?

Mr. BOWER. No, sir; you can not run the total capacity of the plant.

Mr. MAGEE. Then you would have to use steam?

Mr. BOWER. Let me come down to that a little later. Then, the second statement of cumulative evidence—

The CHAIRMAN (interposing). You may proceed to make your statement. I realize that there have been interruptions, and we will try not to ask questions until you have finished.

Mr. BOWER. I do not object to questions at all.

The CHAIRMAN. I understand.

Mr. BOWER. That is the second thing that comes to our attention—the costs submitted by the War Department. Next, we have the report of the British ministry of munitions of war, nitrogen products committee, final report, issued after the war was over. I will not put in the record the names, but this was the character of the members of the committee [exhibiting]. I am referring to page 133 of the report, which says:

"In making the recommendations set out below the committee has been guided by the following salient facts, presumably developed by the previous study:

"(d) Of these salient facts, combined nitrogen (cyanamide or ammonium sulphate)—the two products proposed to be made at this plant—'can be obtained by synthetic processes at a cost at the factory which is less than half the market price of combined nitrogen from other sources, pre-war conditions being taken as the basis in each case.'

As to this cumulative evidence from the third source—the British committee—the War Department has been appealed from, but I never have seen any figures that contradict the cost. Mr. Washburn himself, when he found that he was not going to get this plant for his own purposes, repudiated the statement made before the Committee on Agriculture of the House in the Senate Committee on Agriculture; he practically denied it.

The CHAIRMAN. Permit me to interrupt you. The trouble about making a statement, where you are using all kinds of facts, and then waiting until you get through, is that what you have said has passed out of the minds of persons. I want to say that whether or not nitrogen can be manufactured in one country or another at a price that would permit its being used as fertilizer depends upon the cheapness of the power used.

Mr. BOWERS. Surely.

The CHAIRMAN. Take Norway, where the cost of power, as I recall, when you compute the investment in the plant, is a mere fraction of what it is going to cost at Muscle Shoals.

Mr. BOWER. It is very low—not so much lower.

The CHAIRMAN. When you bring in reports of that kind bearing upon power I can not myself bring my judgment to the conclusion that it is even cumulative—I do not believe that it has any bearing at all. You would first have to show me what a power plant that would produce 100,000 horsepower a year would cost, what the operation of it would cost, and then what you have read, it seems to me, would have some force.

Mr. BOWER. We have Colonel Cooper's estimate that the secondary power can sell for 1.2 mills.

The CHAIRMAN. I understand in Norway the cost to produce hydroelectric power is from \$2 to \$12 per kilowatt year, whereas at Muscle Shoals it costs \$50 a kilowatt year. So the comparison you have given is one that it seems to me of itself falls of its own weight.

Mr. BOWER. Mr. Good, the cost of 1.2 mills per kilowatt hour, as figured by Colonel Cooper and submitted to your committee—I know it was submitted to the Senate committee at the hearing, and I presume that the same statement was made here—1.2 mills for the secondary power at Muscle Shoals figured on 100 per cent power factor, I think it is \$7.58 a horsepower year.

Mr. MAGEE. I should like to get some idea of this if I can. Colonel Cooper gave us a very clear statement of his position. If I understand him rightly, and I do not wish to make any statement which does not agree with the statement

he gave, his position is this: That he is in favor of completing this project solely as a light and power proposition.

Mr. BOWER. Yes, sir.

Mr. MAGEE. He figured that it could cost so much to complete this project that it could be completed in from three to five years, and that at the end of 10 years more the Government could lease this plant for a light and power proposition without even distributing the power, but selling it at the plant?

Mr. BOWER. Yes, sir.

Mr. MAGEE. And get a rental of two and a half million dollars a year, or 5 per cent net on the amount of money which he estimated it would cost to complete this project. I would like to know if you concur in that view, or whether it is your idea the Government should complete this project solely as a fertilizer proposition.

Mr. BOWER. No, sir; I do not claim so. Our thought is that with these possibilities, Mr. Magee, held out to us in the way of future production of fertilizer materials by the electric furnace—

Mr. MAGEE (interposing). Then if you do not concur with him, as I understand, the statement shows that there can be produced here about 88,000 primary horsepower. Is that right, Major Burns.

Major BURNS. In round numbers Colonel Cooper gave it as 100,000 primary horsepower. Do you propose in the fertilizer business to use this primary power?

Mr. BOWER. No, sir; we would be ridiculous to come in and take power for \$28 or whatever that figures out, with power available at \$7.48.

Mr. MAGEE. Then if you are going to use the secondary power there would be certain seasons when you could not operate the plant?

Mr. BOWER. Yes; at certain seasons.

Mr. MAGEE. And you would have to shut down and throw out of work 2,000 or 2,500 men?

Mr. BOWER. No; you would not shut down altogether and throw out 2,500 on account of the drop in horsepower, because your horsepower requirements at that plant are at the carbide furnaces.

Mr. MAGEE. You would have to cut down the number of your men?

Mr. BOWER. Some of them for a little while.

Mr. MAGEE. What proportion would you cut down—50 per cent?

Mr. BOWER. Oh, no, sir. It would simply be the men employed around the carbide furnaces, which would be closed temporarily only.

Mr. MAGEE. You would have to disorganize your organization?

Mr. BOWER. My thought would be this: You figure your total labor cost on cyanamid over the year, and you would run 10 months of the year and have a certain amount of labor cost, and then for 2 months they were idle. It would pay to keep those men. It might add 50 or 75 cents a ton to your cost, but that would be so much cheaper—

Mr. MAGEE. When you figure on using the secondary power, when you did not get that power, then you would not operate the plant?

Mr. BOWER. Not the total plant; absolutely not.

The CHAIRMAN. Why, Mr. Bower, I am amazed that the farm bureaus are interested in building this plant to sell 100,000 primary horsepower to a British corporation.

Mr. BOWER. Oh, no, sir.

The CHAIRMAN. That is practically what this means. I supposed that you were coming here and wanting to use the primary horsepower to manufacture fertilizer.

Mr. BOWER. If it does not cost too much. If it were not for that, we would, but it is uneconomical to do that.

The CHAIRMAN. Why, Colonel Cooper, who is one of the best engineers in the world, said that considering the erratic flow of the Tennessee River it would be uneconomical to manufacture fertilizer at this plant if you sold all of your 100,000 primary horsepower.

Mr. BOWER. And Colonel Cooper stated before the Senate committee—

The CHAIRMAN (interposing). On that matter you are putting your judgment as a representative of farmers against the judgment of one of the best hydroelectric engineers in the world.

Mr. BOWER. I am not criticizing his standpoint as a hydroelectric engineer, but I wish to put in the hearing Colonel Cooper's own statement.

The CHAIRMAN. I can not understand why the farmers—

Mr. BOWER (interposing). Just a moment, Mr. Chairman. Colonel Cooper testified before the Senate committee: "I have put it on that basis. It is the basis I know something about. The fertilizer business I do not know anything about."

Mr. BYRNS. That is what he said here.

The CHAIRMAN. Colonel Cooper was here yesterday and testified positively that you would have to sell this primary horsepower at Muscle Shoals at the point of production, and that if you were going to use it for fertilizer you would have to use it at a basis of cost of 4.4 mills per kilowatt hour.

Mr. BOWER. He said himself before the Senate committee that he knows nothing about the fertilizer business.

COST OF SECONDARY POWER.

The CHAIRMAN. And that if you sold it for commercial purposes, as you have proposed, then you could not use the secondary power and keep 2,000 or 2,500 men there at work.

Mr. BOWER. Our thought has never been to use that big primary power unless it is cheap enough. We might agree with Colonel Cooper that that is too valuable for fertilizer production purposes.

Mr. BYRNS. Let me say that I think Colonel Cooper and General Taylor—and when the record is published it will be shown—made their statements in reply to hypothetical questions, assuming certain facts, put to them by the chairman, and both of them especially disclaimed any knowledge whatsoever of fertilizer or its manufacture.

The CHAIRMAN. I can see how representatives of these power companies down there would take this attitude, but why a representative of a farmers' organization should take this attitude is something I can not understand.

Mr. BOWER. Because we have got to get that cheap power to get our results.

The CHAIRMAN. But look at that power as shown by Plate No. 2. After you have taken 100,000 primary horsepower, as shown by the War Department's plates, which Colonel Cooper states are correct, then your power falls off so rapidly that for more than 40 per cent of the year you will have to run a steam plant, which you say you can not run and produce cheap power.

Mr. BOWER. Oh, not for 40 per cent of the year, Mr. Good.

The CHAIRMAN. Yes; for 40 per cent of the year after you take off your primary power.

Mr. BYRNS. Colonel Cooper did not agree with that statement, Mr. Chairman. He said that that statement was based on only a few years, whereas he had taken 22 years.

Mr. MAGEE. Colonel Cooper absolutely stated, Mr. Byrns, as I understand, that you could not run this plant as a fertilizer plant unless you used the primary horsepower.

Mr. BYRNS. Oh, no; I beg to differ with you. Colonel Cooper especially disclaimed any information about that, and any reply he made was in response to hypothetical questions put to him by the chairman.

Mr. MAGEE. Of course, his statement will show about that; but, as I understand, that was his absolute, unqualified statement.

Mr. BYRNS. He further said that he would work out and file with his statement the results of his investigations with reference to the flow of water covering a period of 22 years, and he especially disclaimed any knowledge of that plate to which the chairman has referred.

Mr. BOWER. I say that we want cheap power, the secondary power, for the fertilizer production. Along that line let me show you what the limitation is in this power. This is the testimony of Mr. Milton Whitney, Chief of the Bureau of Soils, before the Senate Agriculture Committee, with reference to the production of phosphate.

"The first thing we tried was the electric furnace."

This was with reference to the production of phosphoric acid by some new method instead of using sulphuric acid.

"We put in a mixture of phosphate rock, coke, and sand and fused it with electrodes and electric current. When this rock was in a molten condition dense white fumes of phosphoric acids were given off, and reaction taking place and silicate of lime being formed the phosphoric acid was set free. Those gases were put through a Cottrell precipitator and we obtained phosphoric acid in a very pure form. We entered into negotiations with a commercial firm in Hoboken and made a run of six months, and at the end of that time we found that the

cost of the current was so great that the cost of producing phosphoric acid by this method was about three-fourths of a cent more than by the sulphuric-acid method. We felt, therefore, that unless we could get cheap water power the electric method could not be used. As a matter of fact, our calculations were based upon electric power at \$25 per horsepower per year. If you could get electric power for \$2 to \$10 per horsepower per year you could use an electric furnace and get phosphoric acid out cheaper than you can by the sulphuric-acid method."

Now, of course, if you are going to take Colonel Cooper's position that you can not run this plant on anything except the selling price of primary power, then we have not got anything in this proposition, but we have never even thought about that.

Mr. MAGEE. It looks to me that you can not make flesh of one and fowl of the other. If the Government is going into this business, you have either got to make it an electric light and power proposition or you have got to make it a fertilizer proposition, and you can not get away from that conclusion.

The CHAIRMAN. Mr. Bower, in making your computation, what did you figure you would have to get the secondary power for?

Mr. BOWER. Well, I have here Mr. Whitney's statement. Of course I have not made any computation on this. I am not capable of doing that; but Mr. Whitney's computation was that if he could get electric power for \$6 to \$10 per horsepower per year "you could use an electric furnace and get phosphoric acid out cheaper than you can by the sulphuric-acid method."

Colonel Cooper's cost of the secondary power is 1 and 2 mills, which, I think, figures out \$7.58 per horsepower per year.

Mr. MAGEE. His idea was, if you will read his statement, that you should sell all the power, not distribute it but sell it, the primary and secondary power for use in the localities.

Mr. BOWER. I would not be surprised if the Government adopted that method, that this secondary power possibly could bring a higher price for other purposes.

The CHAIRMAN. Colonel Cooper's figure, as I recall, was 1.3 mills per kilowatt-hour, or perhaps it as 1.2 mills. As I read the hearings here, the department has figured 0.75 mill.

Mr. BOWER. Yes.

The CHAIRMAN. So that if you had to have power at 0.75 mill, then the Government would be losing the difference between 0.75 mill and 1.2 mills, which Colonel Cooper says the secondary power could be sold for.

Mr. BOWER. And that would increase the cost of cyanamid, as I gave it, on page 95, referred to before, I think it would make it \$23.04 instead of \$21.97, by taking Colonel Cooper's cost of the secondary power. That is the difference between 0.75 mill and 1.2 mills.

The CHAIRMAN. Give that increase again.

Mr. BOWER. It is on page 95. I simply multiplied 2,808 kilowatt hours at fourths of a mill, which would figure out \$2.10. At 1.2 mills it would be 2,808 kilowatt hours times 1.2. I made that computation, but unfortunately I did not keep it. That would increase the price—

The CHAIRMAN (interposing). About \$1.25?

Mr. BOWER. It would be \$3.37 instead of \$2.10, an increase of \$1.27 per ton. (Hearings on sundry civil appropriation bill for 1922, p. 119 et seq.)

Mr. MARTIN. I would also like to introduce at this point, since we have gone into this, the testimony which was given before the House Military Committee recently by Mr. Theodore Swann, president of the Federal Phosphorus Co., of Birmingham, when this same question was up. There is a company that has gone through its troublesome days, and its difficulties, and has developed a very interesting business at Anniston, Ala. It is now engaged in the manufacture of phosphoric acid by the electric-furnace process, and step by step the company plans to extend that development into fertilizer lines.

The CHAIRMAN. Are they making fertilizer now?

Mr. MARTIN. They are making simply phosphoric acid. They are experimenting now, and I think will shortly produce a fertilizer containing the three elements.

The CHAIRMAN. Do they have water power that they utilize?

Mr. MARTIN. Yes, sir. That company takes its power from our system.

The CHAIRMAN. It buys its power from you?

Mr. MARTIN. Yes, sir. It has taken a great deal of power over the past five years. The business was first developed as a plant to smelt manganese ore to

meet war-time requirements, and when the war ceased the plant could not function because ferromanganese dropped, as you know, so quickly and sharply in price. Then Mr. Swann began to experiment with the phosphoric problem and afterwards produced phosphoric acid, and is now selling in the commercial market a high grade of phosphoric acid.

The CHAIRMAN. They are doing that as a commercial proposition and selling it on the market?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. Is it a difficult process that they have?

Mr. MARTIN. It is quite a difficult process.

The CHAIRMAN. Does it require a great deal of power?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. What did their power cost them?

Mr. MARTIN. They are using now primary power and primary power costs them between 6 and 8 mills.

The CHAIRMAN. Six mills per kilowatt-hour?

Mr. MARTIN. Yes, sir.

Senator HEFLIN. At what place do you supply this power?

Mr. MARTIN. We supply it from the Lock 12 power plant of the Coosa River, over lines which transmit that power to Anniston, a distance of 75 miles.

The CHAIRMAN. You develop that power from your dam on the Coosa?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. And you transmit it over your transmission line 75 miles?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. And sell it to them at approximately 6 mills?

Mr. MARTIN. Something over 6 mills.

Senator MCKINLEY. To get it down on a comparison with everything else, in horsepower that would be about 4½ mills per horsepower-hour?

Mr. MARTIN. Yes, sir. Let me say this. That product is produced and sells in the high-grade market, in the food-products market, and is in no sense a fertilizer, and cheaper power must be obtained if a fertilizer is to be manufactured which will compete with other commercial fertilizers.

The next step is to get that product to a point where it can sell in the fertilizer market, in which case Mr. Swann thinks it is necessary to take secondary power.

The CHAIRMAN. He will have to cheaper power in order to do that?

Mr. MARTIN. Cheaper power. He testified before the House Military Affairs Committee in this way:

"Having once been in the power business and knowing something of that end of the proposition, I always had in mind trying to find something that could utilize secondary power, knowing that it could be obtained cheap in the South, since the entire Appalachian section is one of seasonal stream flow. The fertilizer business is seasonal, so the two fit in together very well.

"This process is adaptable to be used anywhere where you can get secondary power or cheap power; and I say secondary because that means cheaper power than primary power, and, of course, should be used, if you want to get the greatest economy out of it, as near the center of consumption as you can."

His theory of the development is to establish plants at different locations where cheap secondary power can be had, at locations which are near the center of use of fertilizer.

Senator HEFLIN. What would the secondary power cost now if you should furnish that and transmit it to him at Anniston? The primary costs 4.5 mills per horsepower-hour.

Mr. MARTIN. I have not figured it on that basis.

Senator HEFLIN. If the primary power costs you 4½ mills, what could you supply secondary horsepower for?

Mr. MARTIN. We would not undertake to supply him with secondary power at Anniston, because it means transmission a distance of 75 miles, which would mean using only intermittently a large investment in lines. The feasible thing to do would be to locate that plant at the site of the power development, Lock 12, or at our new dam, and take power from a short transmission distance.

Going back to the terms of the proposal we submitted, we also propose to operate and maintain the power plant, dam, and gates; the Government will operate and maintain the locks, and the power company would supply the necessary power without expense to the Government.

Now, Mr. Chairman, the Secretary of War called especial attention to the question of operation of the power plant, dam, and gates, and referred to that

as a distinct advantage to the Government, because assuming the duty of operating and maintaining the power plant, dam, and gates, of course, takes the burden off of the Government, and in case of trouble, leakage, or in case of any washout or any difficulties whatever of any kind, the burden passes to the licensee.

There is an offer pending which provides that there shall be paid to the Government a total fixed annual sum of \$55,000 for repairs, maintenance, and operation of the dam, and gates and locks, rather than assuming the burden of whatever it might be, and we believe that this is one distinct advantage that the Government obtains under our proposal.

We also propose for the Government to transfer to the licensee the Wilson Dam property, represented by its investment and commitments to date, free of liabilities and unencumbered, including the construction plant. The locks and navigation structures to be conveyed to the Government in fee on completion of construction.

The Government has to-day approximately \$17,000,000 of investment in the project. Whatever its investment is, at the end of 50 years, under the terms of the Federal water power act the Government may take over the project by paying the licensee simply the new money the licensee puts into the project. In other words, if the Government accepts the proposal of the Alabama Power Co., and the Alabama Power Co. as licensee in the 50-year interim, puts new money into the project, the Government would simply have to pay the licensee the net investment made by it, and in the 50-year interim, under the terms of our proposal, the Government receives a return on the \$17,000,000 in the form of the charges which it may collect from us if we use the secondary power or in the form of a charge it may collect from somebody else if they manufacture fertilizer. In other words, the \$17,000,000 is so set up under our proposal as to give a return to the Government during the 50 years, and if the policy of the Government at the end of 50 years is to take over the project under the terms of the water power act the Government only needs to pay us the net investment under the terms of the Federal water power act. We wanted particularly to bring that out at this hearing.

Senator KENDRICK. Then your proposition, Mr. Martin, is for 50 years only?

Mr. MARTIN. Yes, sir; for 50 years, under the terms of the Federal water power act, at the end of which time, as you know, under that act the Government may take over the project on paying simply the net investment. During the 50-year period, under the terms of the water power act, should the Government require the project may be taken over by payment to a licensee just compensation therefor.

Senator KENDRICK. And you furnish the money to complete the dam?

Mr. MARTIN. The dam, locks, and power house.

Senator KENDRICK. Do you propose to complete No. 3 Dam?

Mr. MARTIN. We have not proposed in this offer to complete No. 3.

Senator KENDRICK. Will that not be necessary, in carrying out the plan of the United States, in order to give navigation?

Senator HARRELD. Your plan does not contemplate the completion of No. 3 Dam?

The CHAIRMAN. No. You were not here when he made that statement, Senator.

Senator HARRELD. I think I got the idea just now from him that it did.

I would like to have you straighten that out.

Senator KENDRICK. You propose to finish No. 2, but you have not proposed to build No. 3, which is necessary to open up that river to navigation?

Mr. MARTIN. I will take up your point first, Senator Harreld. Then I will answer Senator Kendrick.

Senator HARRELD. Just state what you would do with regard to the dam.

Mr. MARTIN. Taking Dam No. 2, we would take up the work where the Government leaves it off. We propose to furnish all the money necessary to complete the Wilson Dam, to put in all necessary equipment, the Government's investment of \$17,000,000, or whatever it has invested, to stand as it stands to-day, as the limit of the Government's investment. We propose to take it up there and complete it.

Senator HARRELD. You would proceed, now, under the terms of this Federal water power act?

Mr. MARTIN. Yes, sir; the Federal water power act of June 10, 1920.

Senator HARRELD. Just as though the \$17,000,000 had not been spent?

Mr. MARTIN. Yes, sir. We propose to take it up as it stands to-day. That act fits into this situation or answers one question which is very important—what becomes of the Government's \$17,000,000. The Government puts no more money into it under the proposal that we make, but during the 50 years gets a return on its investment of that \$17,000,000—namely, it gets 100,000 secondary power which it can sell to us or sell to somebody in the fertilizer business. At the end of 50 years, if it is the policy of the Government to operate the water powers, it may take the project over. It does not then pay us the \$17,000,000, does not pay anyone the \$17,000,000, but simply pays, under the terms of the Federal water power act, the net investment put into the project by the licensee from this day forward.

Senator HARRELD. That is Dam No. 2. What about Dam No. 3?

Mr. MARTIN. Our proposition does not deal with Dam No. 3.

Senator HEFLIN. The money you put in now to complete Dam No. 2, at the end of 50 years the Government would pay back?

Mr. MARTIN. On the basis of net investment; yes, sir.

The CHAIRMAN. In other words, under the Federal water power act at the end of 50 years if the Government wants to take the property it has got to pay to the licensee whatever it has cost to complete the dam. He is calling attention now to the fact that the Government already having spent \$17,000,000, it would not have to, under their proposition, repay that. In other words, it would not pay the same amount to reclaim the property at the end of 50 years that it does ordinarily under the Federal water power act. It would only pay the company the amount that is necessary for them to expend to complete it from this point.

Senator HEFLIN. In other words, if it cost \$17,000,000 to put in the dam as it now stands and the Alabama Power Co. should spend \$17,000,000 more in completing it, at the end of 50 years the Government would have paid all of that \$34,000,000?

The CHAIRMAN. No; just \$17,000,000.

Senator HARRELD. The Government could take it by paying back the \$17,000,000 to them?

Senator HEFLIN. Yes; \$17,000,000. But the Government having paid the other \$17,000,000 in the first place, would be out the whole \$34,000,000 if it takes it over.

The CHAIRMAN. Yes; it would.

Senator HARRELD. But he proposes that that first \$17,000,000 be repaid by the sale of this secondary power in the interim.

The CHAIRMAN. When the 50 years are up the Government has already spent the \$17,000,000. It puts in that money. It would still have that interest in the plant—its investment of \$17,000,000, which it would in fact own.

What are you going to do, Mr. Martin, about the Government's equipment if you take this over? The Government has a very large equipment that is necessary for anybody to have to complete this dam.

Mr. MARTIN. That is included in the \$17,000,000, whatever that equipment is.

The CHAIRMAN. And you propose the Government shall turn that over to you?

Mr. MARTIN. And we will take it and complete the work.

The CHAIRMAN. What will happen to it when the work is completed? It will not be of much value, will it?

Mr. MARTIN. It will have some salvage value.

The CHAIRMAN. There is quite a mileage of railroad also.

Senator KENDRICK. It seems to me, Mr. Chairman, if I may interrupt, to be a consistent proposition on the ground that it will reduce the final payment of the Government because of this equipment being on hand.

Mr. MARTIN. Yes, sir.

Senator KENDRICK. The fact that the Government has the machinery now there undoubtedly will reduce the item of cost to the Government in the end.

Mr. MARTIN. Yes, sir; because we will have to provide that cost.

Let me suggest this difference, Senator Heflin, between the net investment and the terms which were used in the early discussions of the Federal water power act. The question of net investment is the actual net dollars which we may put into the project. It excludes the idea of going value, going concern. It excludes all intangibles. It excludes the added value which use and time may bring to a project of this kind, whereas if that were not the law, if the Government had the right to take it over at a fair value, of course that becomes, under the terms of the law, a question of what is the fair value at the end of 50 years under the then existing conditions, including going concern.

Senator HARRELD. Good will and everything else.

Mr. MARTIN. The items of good will and going value are excluded by the terms of the Federal water power act. That becomes important in considering the amount that the Government would have to pay at the end of 50 years, and if by chance the net investment should be greater than the fair value the Government has a right to take it at fair value, then.

The CHAIRMAN. You mean if the net investment should be greater than the fair value the Government can take it at the fair value?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. In other words, the Government, under the act, can take it at the fair value, which in no case shall exceed the net investment?

Mr. MARTIN. Yes. That is another way of expressing it, which, of course, preserves to the Government and to the public all of the increased or added values which accrue to this project in the course of 50 years.

As you understand, the act also provides that if the United States does not take over this project at the end of 50 years, then there is reserved to the State or to any municipality the preferential right to renew that license. We have no preference—

Senator KENDRICK (interposing). With the right to take over the dam?

Mr. MARTIN. Yes, sir; with the right to take over the project. If the State of Alabama wants to take over this project, the Government not wanting to take it over, the State could do it on the same terms as the United States.

Senator KENDRICK. It seems to me, unless the proposal includes the construction of Dam No. 3, there will be a long section of the river in which there is no navigation; and the thing would fail, so far as the navigation is concerned.

Mr. MARTIN. Yes, sir; Senator, that is very true.

Senator HARRELD. You make no provision in your offer for Dam No. 3?

Mr. MARTIN. We have not at this time, Senator. Dam No. 3, of course, is one of the projects which ought to be completed. The Dam No. 3 site is owned by the Alabama Power Co., and has been owned by it for a great many years. These two projects, Dams Nos. 2 and 3, have been the subject of consideration for 10 years, which I would like to go into before you gentlemen and show to what extent our company has gone into it.

When it comes to building Dam No. 3, it is not proposed to build that under possibly three years or four years, and we feel that power-market conditions will justify the building of that dam three to four years hence; and, so far as we are concerned, we would be in position to go forward with the building of that dam at the end or completion of Wilson Dam on some basis of cooperation with the Government.

Senator KENDRICK. It would seem to me, without having studied it very closely, that the nitrate plants and fertilizer plants would be almost contingent upon the opening up of that river to navigation for cheap transportation.

Senator HARRELD. Suppose the committee is of the opinion that it is all one project, including Dam No. 3, and it should all be embraced in the same contract, so that the Government can redeem it at the end of 50 years, including both Dam No. 2 and Dam No. 3, considering it all as one project?

Mr. MARTIN. It would be our purpose to undertake the building of Dam No. 3 under the Federal water power act.

Senator HARRELD. I can see this difficulty with that proposition: If we should accept your proposal, and if we made a contract with the power company at the end of four years to build the other dam, then at the end of 50 years, if the Government should want to take this project back, you would still have your rights in Dam No. 3?

Mr. MARTIN. We could not build Dam No. 3 under any law now except under the Federal water power act, which gives the Government the right to take it over at the end of 50 years.

Senator HARRELD. Yes; but the 50 years would be at an end at a different time.

Mr. MARTIN. There would probably be a difference of three years, but would that be a very serious matter? At any rate the terms of the Federal water power act control.

Senator KENDRICK. Mr. Chairman, do we have any information, do you recall, in regard to the cost of that steam plant at Dam No. 2, what it cost the Government?

The CHAIRMAN. Yes; we have figures on what that cost. It is all in the record. The steam plant, Senator, at the nitrate plant there, is between twelve and thirteen million.

Senator HEFLIN. Is that No. 2?

The CHAIRMAN. Well, it is nitrate plant No. 2; yes—the cyanamid plant—the big one.

Senator HEFLIN. I understood Major Burns to say that the other one cost about \$13,000,000.

The CHAIRMAN. No; we are speaking of the steam plant.

Senator HARRISON. Gorgas cost about \$4,000,000.

The CHAIRMAN. Yes; the Gorgas plant.

Senator HEFLIN. I was speaking of No. 1 plant.

The CHAIRMAN. That cost about three or four million.

Major BURNS. One and a quarter million.

Mr. MARTIN. I would like to mention, in connection with this question of navigation on the Tennessee River, that even the building of Dam No. 3 does not necessarily complete this navigation, because, after you build No. 2, you have got to build, as explained to you by Colonel Barden, Dam No. 1.

Senator KENDRICK. Yes; but that is of incidental importance.

Mr. MARTIN. You have the Hobbs Island dam, the Buck Island dam, the Mink Creek dam, the Bellefonte dam, and the Widows Bar dam, mentioned by Colonel Barden when he testified before this committee. Those dams have to be built in order to complete navigation up to Hales Bar. (See H. Doc. 1262, 64th Cong., 1st sess., Pl. No. 2.) You have six dams in order to complete the scheme of navigation after you build No. 2 and No. 3. So that even the building of Dam No. 3 immediately does not open the river to navigation completely the year around, as Colonel Barden pointed out.

Senator KENDRICK. I am not quite clear on this point. I want to find out whether that river is open from Muscle Shoals in either direction.

The CHAIRMAN. No; but, Senator, from Muscle Shoals to the mouth of the river, if Dams Nos. 1 and 2 were completed, commencing way back, so far as the building of Dam No. 3, would dam up the river and would make the river navigable at 6 feet to the mouth of the river, with the exception of one place, where we would have to build what is known in this record as Dam No. 1, at the bridge across the river between Florence and Sheffield. The building of that dam would make the river navigable all the way to the mouth. These other dams that Mr. Martin speaks of are farther up the river and would add to navigation upstream.

Senator KENDRICK. After all, the downstream navigation is most important.

The CHAIRMAN. Yes.

Mr. MARTIN. Now, gentlemen, I will just add this conclusion on the details of the offer, that the financial obligations which the licensee would assume under the proposal we tendered involve very large sums, sums which approximate twenty-five to thirty million dollars, and the Alabama Power Co. is in position to undertake this financial obligation and has made arrangements as completely as is possible with the banking houses with which it has done business for many years, namely, Messrs. Harris, Forbes & Co., and Messrs. Coffin & Burr, and feels that it is in position to raise the necessary funds as this work progresses. This matter has been exhaustively examined by these banking houses and our own engineers, and we are satisfied we are in position to go forward and assume these obligations.

Senator KENDRICK. You would not be willing to take up this dam and complete it under the supervision of the Government in a way that would meet the requirements of Government supervision?

Mr. MARTIN. Yes, sir; the Government would approve the plans to be followed.

Senator KENDRICK. That would be the only way that I could see that you could complete it.

Mr. MARTIN. Of course, that is true, Senator, and that is the proposal we make.

Senator HARRELD. Does not the Federal Water Power Act provide all that?

Mr. MARTIN. Yes, sir; it provides for approval by the Secretary of War, the Chief of Engineers, and, in addition to that the plans must be approved formally by the Federal Water Power Commission.

The Alabama Power Co. is now constructing a dam in Alabama on the Coosa River under a 50-year license granted by the Federal Power Commission about a year ago, and this Coosa River is a navigable stream. This particular development will produce 120,000 horsepower.

Senator HEFLIN. That is Lock No. 18?

Mr. MARTIN. No, sir; that is just above Lock No. 18.

Senator KENDRICK. Our Government engineers estimate the length of time to be three years required in the completion of this Dam No. 2. How much would you expect to shorten that period of time?

Mr. MARTIN. Well, we estimate the time approximately the same: 30 to 36 months. That is an approximation.

The CHAIRMAN. Now, Mr. Martin, you propose to take possession of the property there that the Government now has—all its utilities?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. The houses where the men live, and all that?

Mr. MARTIN. On the Wilson Dam project.

The CHAIRMAN. Yes; on the Wilson Dam project. That is what I am speaking about.

Mr. MARTIN. Yes, sir.

The CHAIRMAN. Your proposition means that there shall be turned over to you not only the Government's railroad and bridges and its mixing plants and all that, but the houses at Wilson Dam where the men live?

Mr. MARTIN. Yes, sir; as part of the Wilson Dam camp.

The CHAIRMAN. Yes; that is part of the camp.

Mr. MARTIN. Representing part of the \$17,000,000 that the Government has expended there.

The CHAIRMAN. Yes. That shall all be turned over to you, everything, indeed, except the locks, which the Government shall retain title to?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. You will own all that property?

Mr. MARTIN. Yes; subject to the Government's option to take it over.

The CHAIRMAN. To take it over at the end of 50 years?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. Do your engineers figure that you can take that property turned over to you in the condition in which it is now in and complete it for a less sum than the Government would complete it if the present force simply went on and finished it?

Mr. MARTIN. Senator, we do; because we do not have the 8-hour principle.

The CHAIRMAN. That is one of the questions that would arise right away.

Mr. MARTIN. We would eliminate overtime.

The CHAIRMAN. Before you go into those details tell me, if you can, how much less, in your judgment, it would cost your company to complete that work?

Mr. MARTIN. Well, I would not want to set an amount, Senator.

The CHAIRMAN. One of the reasons why you could do it for less is that you would work 10 hours instead of 8?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. Or would you work more than that?

Mr. MARTIN. I do not think we would work over 10 hours; no, sir.

The CHAIRMAN. What other saving besides labor?

Mr. MARTIN. You would have certain holidays which the Government civil service provides for.

The CHAIRMAN. Let us see about the holidays. What holidays would the Government have to pay men for when they did not work, that you would get work out of?

Mr. MARTIN. All the legal holidays and half holidays during certain months.

Senator HARRELD. We have 13 in the course of the year in Washington.

Mr. MARTIN. Those holidays would come out.

The CHAIRMAN. What civil service rule do you refer to?

Mr. MARTIN. I am speaking generally. That is my impression.

The CHAIRMAN. You mean there is a civil-service rule applying to men who would go there and work on the dam, like, for instance, the fellow who shovels gravel or handles stone?

Mr. MARTIN. As to the question of his discharge, and so forth?

The CHAIRMAN. Yes.

Mr. MARTIN. I don't know that it is in that particular relation, but—

The CHAIRMAN (interposing). Do you mean to say that the Government officials could not discharge that kind of a man?

Mr. MARTIN. I do not want to go to that extent.

The CHAIRMAN. If they could not discharge him, would they have to give a civil-service examination before they put him to work carrying brick or shoveling sand?

Mr. MARTIN. I think I can find in just a moment a definite expression as to why you would have to keep them.

In the former recommendation which was made for carrying out this project the Board of Engineers for Rivers and Harbors recommended that the development be made by our company, then proposing to undertake it, for the reason that the company would be relieved from certain Government restrictions and limitations. I have this report right here, and I will give you exactly the terms of the recommendation of the Government engineers at that time of this very project.

The CHAIRMAN. I am not particularly interested in what the report shows. I am trying to find out how much cheaper you can do this work than the Government.

Senator HARRELD. And why.

The CHAIRMAN. Then I want to get the items of saving, and I would like to have you go into detail on that. How are you going to save this money, in other words?

Mr. MARTIN. The questions I mentioned were thus presented by Major Burgess, district engineer, considering this project in 1916 (H. Doc. 1262, p. 38), his views being concurred in by Colonel (now General) Beach: "The contractor does not have to stop work for so many holidays, as would be necessary for the Government force. The contractor is not usually permitted to work either on Sundays or on legal holidays, but he is not required to suspend work on the Saturday half holidays, which, by Executive order, are observed by the Government force."

The importance of this latter fact may be noted from the table in paragraph 68, where the item to cover Saturday half holidays is estimated at \$360,000. The contractor has another advantage in his freedom in the selection of his employees, which enables him to demand the greatest degree of efficiency. In the Government service employees are selected from registers of eligibles established by the Civil Service Commission. Whenever eligibles are certified by the commission the men usually are efficient, although the efficiency has been proved more by theoretical examination than by the test of experience. Frequently, however, the commission is unable to certify a list of names and, in fact, in this engineer district it has been the exception rather than the rule to have eligibles available when they are needed.

"The result is that noncivil service or temporary men must be employed. This would be entirely satisfactory if such temporary employees, when found efficient, could be retained; but under the regulations of the commission such temporary employees are subject to discharge when subsequent examinations have resulted in the establishment of a register. Such unnecessary changes of employees during the progress of the work, and the forced discharge of men whose efficiency has been proved by actual service rather than by theoretical examinations, necessarily reduce the average efficiency of Government employees on Engineer Department work. The contractor, knowing that his profit depends on the quality and efficiency of the men engaged by him, hires only this kind, or discharges men who do not meet his standard. However desirable it seems to the Government engineer in charge of work of this character to secure the highest degree of efficiency in his force, he has very little power to obtain it.

"78. The conditions mentioned above indicate the advisability of contracting Government work in the Engineer Department whenever practicable."

The CHAIRMAN. You don't mean, Mr. Martin, that the Government Civil Service has to examine all those fellows that work on this plant down there, do you?

Mr. MARTIN. I am quoting from House Document 1262, page 36, presented by the Board of Engineers for Rivers and Harbors as their reason why this work should be undertaken by a private company rather than by the Government.

As to the exact effect of the civil service upon this work I can only stand upon what these gentlemen said in this report.

The CHAIRMAN. I see. You have no knowledge of your own with regard to that?

Mr. MARTIN. No. It has been in my mind for many years that that was applicable. It arose from this report that is before the committee and is signed by Major Burgess, concurred in by General Beach, who was at that time a colonel in the Corps of Engineers.

In our estimate of cost of construction we have had to provide transmission lines, and our figure of twenty-five to thirty million dollars capital required embraces not only the cost of this work, but bringing the power to market.

Senator HEFLIN. Mr. Chairman, Mr. Ford claims, as I understand it, that he can complete this dam for twenty to twenty-two million dollars. The Gov-

ernment's estimate of cost is about \$28,000,000. So there would be a saving of six or eight million dollars in Mr. Ford's suggestion. You do not know how much cheaper, then, you could build it than the Government, Mr. Martin?

Mr. MARTIN. Well, we have made various estimates on the work to be done, Senator.

The CHAIRMAN. We would like to have that. I wish you would put those figures in the record. I don't suppose your contract binds you to do it for less; yet we would like to have the opinion of the men making the various offers, because I think that has a great deal to do with the action of the committee in deciding what action it should take.

Mr. MARTIN. Yes. We will get up some figures and present them to you to-morrow.

The CHAIRMAN. All right.

Senator KENDRICK. Any contract considered by the Government must necessarily include No. 2 for the Government to know what the discrepancy is in the actual cost.

Mr. MARTIN. Senator, the Federal Power Commission has established accounting rules, and they know exactly what money goes into the project. In addition to that, the Government now, at our work at the Coosa River, maintains two inspectors constantly at our work.

Senator HARRELD. That is covered by the Federal power act.

Mr. MARTIN. By the Federal power act.

The CHAIRMAN. If you have reached a place in your testimony where it would not disturb you, I would like to make some inquiry about Gorgas, where the Government and your company own in partnership, as it were, a whole lot of property.

Mr. MARTIN. I would be glad to have you ask those questions of Mr. Dent. He was going to take that up.

The CHAIRMAN. If somebody else was going to do it, I don't want to interfere with your plan.

Senator HEFLIN. I suggested to you that Mr. Dent would be heard on the Gorgas proposition.

The CHAIRMAN. I understood that Mr. Dent was to be heard on the legal phases of it. There are some legal questions involved. I thought you would be able to tell us just exactly how the Gorgas plant is divided up.

Mr. MARTIN. I am at your service, Senator.

The CHAIRMAN. How is it owned? Is there anything else you want to say?

Mr. MARTIN. There are some general statements which I might hurry through, to this extent, Senator.

The Alabama Power Co. is a corporation organized under the laws of Alabama in 1906. The Muscle Shoals Hydroelectric Power Co. is another corporation organized in that State about the same time. Those companies were owned by individuals in that State, and those companies acquired certain power sites, and there was also another company known as the Birmingham, Montgomery & Gulf Power Co. that acquired a site on still a third river. Those joined with other citizens of our State, and in 1912 they succeeded in interesting a group of people to undertake their power development. Mr. James Mitchell was the man who came into it in 1912 and assumed the obligation to raise funds for power development. Mr. Worthington was the gentleman who was in charge of Muscle Shoals, with his associates. They conceived a plan of developing Muscle Shoals upon the theory which you brought out in your hearings, namely, the building of the two dams at Muscle Shoals, together with storage reservoirs in another watershed, and then they became interested in Cherokee Bluffs, a power site on the Tallapoosa River, and another one on the Little River. In Alabama, with a view to building storage reservoirs and tying these developments together by transmission lines and thus supplementing the Muscle Shoals project.

This scheme of development of Muscle Shoals was made the subject of a proposal by the Muscle Shoals Hydroelectric Power Co. in 1913; and, later, in 1916, excerpts of which I will hand you, they involved a plan of building these reservoirs and sites and bringing to the aid of the Muscle Shoals stored water something in excess of 50,000,000,000 cubic feet, which would have the effect, as shown by the official documents in which these matters are so fully considered, of practically doubling the primary power at Muscle Shoals and making secondary power at Muscle Shoals valuable which otherwise would not be valuable. Now, that plan of development was recommended on two different occasions to the Congress by the engineers of the United States, and I

wish to call attention to those reports: Rivers and Harbors Committee, Document No. 20, Sixty-third Congress, second session, of the date of May 18, 1914; also House Document No. 1262, Sixty-fourth Congress, first session, dated June 28, 1916.

That plan was one of cooperation between the Government and the company, then known as the Muscle Shoals Hydroelectric Co., which was owned by our company at that time.

The CHAIRMAN. That is a subsidiary of the Alabama Power Co.?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. And those other companies you have named are subsidiaries of the Alabama Power Co.?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. How many other companies does the Alabama Power Co. own? How many subsidiaries have you?

Mr. MARTIN. Four or five.

The CHAIRMAN. What do you have them for? Why don't you own the property directly?

Mr. MARTIN. We do own all the developed properties.

The CHAIRMAN. When it is developed it is transferred to you?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. What is the object of that?

Mr. MARTIN. We did not organize them. We had no object in organizing them. We just took them over.

The CHAIRMAN. How did you become the owner of them?

Mr. MARTIN. We purchased the stock from the various people in Alabama who organized them. There were three different groups of citizens of our State, who had no relation with each other, who conceived the idea of development at one place, then at another, then at another. They went out and made country-wide, even world-wide efforts to find somebody to develop these water powers. They all got together in 1912 and transferred their stock holdings to Mr. James Mitchell and his associates, who had not prior to that time been interested in the projects in any way.

The CHAIRMAN. And formed the Alabama Power Co.?

Mr. MARTIN. They turned these properties over to the Alabama Power Co. along with the other companies, and the Alabama Power Co. became the operating company.

The CHAIRMAN. So often I can not understand—sometimes I can—why a corporation should maintain so many subsidiary corporations, making a complex network of corporations owning each other.

Mr. MARTIN. It is the policy of our company to operate only in the name of the Alabama Power Co. That is the soundest and best way to operate.

Senator HEFLIN. Do you mean that these other organizations were perfected by people outside of the Alabama Power Co., and that you then bought their stock?

Mr. MARTIN. For instance, Captain Lay organized the Alabama Power Co. We purchased the stock of that company. Mr. Worthington and his associates organized the Muscle Shoals Co. They also organized the Birmingham, Montgomery & Gulf Co. The same groups were not interested in all of those companies. Those people all got together in 1912 and sold their interests in those various companies to Mr. Mitchell—as I have stated.

The CHAIRMAN. And he gave them for it stock in the Alabama Power Co.?

Mr. MARTIN. And money and bonds and assumed the duty of development.

We began development of Lock No. 12 on the Coosa River. That development has been completed. It was made under act of Congress of 1907. It has 110,000 horsepower capacity. Since 1912 no company in our State has been in position to develop water power because, up to 1920, there was no Federal legislation. We tried in 1912 to get Lock 18 built, and one other development in our State, and it happened that the United States Government owned 80 acres of land, 5 acres of which were flooded, and the Secretary of the Interior withdrew the land from entry 10 years ago. We were, off and on, 12 years getting the right to use that 5 acres of land.

Senator HEFLIN. What has your company done at Lock 18?

Mr. MARTIN. It has done nothing, because, as you recall, President Taft vetoed the bill you introduced authorizing that development, and in his veto message of August 24, 1912, said: "I deem it highly important that the Nation should adopt a consistent and harmonious policy of treatment of these water-power projects which will preserve for this purpose their value

to the Government, whose right it is to grant the permit. The necessity for the adoption of such a policy has recently been pointed out, with my approval, by the Secretary of War, and I see no reason why this bill should be exempted from the safeguards which have been recommended by him in the cases of other bills now pending before Congress."

Senator HEFLIN. At Lock 12 you have got a dam?

Mr. MARTIN. That is developed.

The CHAIRMAN. You were mentioning these reservoir sites. To my mind that is extremely important in connection with the development of power on the Tennessee River, but you haven't anything of that kind in your proposal?

Mr. MARTIN. That is, to develop these reservoirs?

The CHAIRMAN. Yes.

Mr. MARTIN. It is not expressed in our proposal, but that is exactly our plan, Senator.

The CHAIRMAN. Why is it not in your proposal?

Mr. MARTIN. I don't know that we considered it essential. We would be very glad to make any obligation necessary about it.

The CHAIRMAN. How much investigation have you made? Have you made surveys to see what can be done; have you anything definite on it?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. It is about time to quit now, but I would like to have you go into that to-morrow very fully.

Mr. MARTIN. We have a great deal of detail about that, Senator.

Senator KENDRICK. I would like to ask a question: First, I understand Mr. Martin to say that his proposition includes the purchase of the Government's interest in the Gorgas plant, in the transmission line between that and Muscle Shoals, and the steam plant at Muscle Shoals, and the incidental property that the Government has and used in the construction of the dams, of \$5,000,000?

Mr. MARTIN. Plus the 100,000 horsepower.

Senator KENDRICK. Yes; I understand that. Now, then, the question a moment ago as to the cost of the steam plant developed the fact that between twelve and thirteen million dollars had been expended. What did the Government investment amount to at the Gorgas steam plant?

Mr. MARTIN. About three and a half million dollars. Then there was an additional investment in transmission line subsequently. The total was approximately \$5,000,000.

Senator HEFLIN. And what was the expenditure of the Alabama Power Co.?

Mr. MARTIN. Why, Senator, we have invested there something in excess of \$4,000,000 in steam plant and various other lines leading from that. In addition to that we have investment in coal mines.

Senator HEFLIN. I am speaking of the plant proper. You invested nearly as much or about as much as the Government?

Mr. MARTIN. About as much.

Senator KENDRICK. That is a little aside. I wanted to get the actual investment of the Government, which amounts, according to your statement, to about \$18,000,000?

Mr. MARTIN. Yes, sir.

Senator KENDRICK. For which you offer \$5,000,000?

Mr. MARTIN. Plus the power. Of course the power has its value, and the further development has its value.

Senator HARRELD. Now, speaking about these storage reservoirs, you are going to store not alone waters of the watershed that belongs to the Tennessee River, but you your plans include the storage of waters of other watersheds, too, didn't you say, that might be diverted and used at Muscle Shoals?

Mr. MARTIN. Yes, sir. Our plan involves not storage on the Tennessee River but at different watersheds in Alabama.

The CHAIRMAN. Well, tributaries of the Tennessee?

Mr. MARTIN. No, sir.

The CHAIRMAN. Then you haven't any storage proposition that will increase the flow of the Tennessee?

Mr. MARTIN. Not to increase the flow, but it will increase the power by bringing to Muscle Shoals power from the watersheds of other rivers.

The CHAIRMAN. Then you will have to construct canals?

Mr. MARTIN. No; transmission lines.

The CHAIRMAN. Oh, power plants. I did not understand that.

Mr. MARTIN. That was the theory on which the proposed development proceeded in 1913 and 1916, and which was recommended to Congress.

The CHAIRMAN. Well, then, you have not made any investigation or survey with a view to storing water in reservoirs either on the Tennessee or any of its tributaries above Muscle Shoals?

Mr. MARTIN. No, sir. We have no interest and have not made that investigation.

The CHAIRMAN. You realize that is a very important thing in connection with the amount of primary power at those two dams?

Mr. MARTIN. Yes, sir; but we think it is much more feasible to store that water on another watershed and build transmission lines and thus supplement the waterpower than by developing these dams a distance of some several hundred miles away.

The CHAIRMAN. Then you would not increase the primary power at the dam?

Mr. MARTIN. We would increase the value of the secondary power.

The CHAIRMAN. Oh, yes; you could do that by getting your power anywhere; but, of course, if you could store water, if there is a practical place where the water can be stored at an expense that is reasonable, that of itself would increase the primary power, which adds, of course, very greatly to the value of it.

Mr. MARTIN. That is the scheme of development which we have long projected in connection with Muscle Shoals.

The CHAIRMAN. You have made no survey with regard to that?

Mr. MARTIN. Not on the Tennessee River.

The CHAIRMAN. You can not increase the flow of the water or you can not store up the water that is going to flow over Muscle Shoals by building a dam on some other watershed?

Mr. MARTIN. No; but we could increase the power.

The CHAIRMAN. Yes; you could do that and you could do it by building a steam plant and carrying the power on a transmission line.

Senator HARRELD. In other words, you would transmit power rather than transmit water?

Mr. MARTIN. That is correct, Senator.

The CHAIRMAN. But the weakness of the Tennessee River as a power proposition, one of its greatest, if not its greatest weakness, is the vast difference between the minimum and maximum flow of the river, which means that the secondary power is very great and, comparatively speaking, the primary power is small.

Mr. MARTIN. Absolutely, Senator. That is its weakness.

The CHAIRMAN. Yes. I have said that I have thought it was the greatest weakness there was.

Mr. MARTIN. This plate shows the available energy at Muscle Shoals, Tallapoosa River System, and Little River, and you see the primary power runs to 2,453,000,000 horsepower hours per year. You see that is from your secondary available power. When you look at the other chart, plate 109, where Muscle Shoals stands alone, you simply have 700,800,000 horsepower hours per year, and that is your limit.

The CHAIRMAN. Your plan of conducting power over there does increase the power, of course, that you can utilize, but it does not increase the primary power of the Tennessee River.

Mr. MARTIN. Well, no.

The CHAIRMAN. You have your secondary power all going to waste there, just the same. It is simply supplemented with some other power.

Senator HARRELD. In other words, you propose not only to have reserve from your steam plant, but reserve from other water power from other watersheds?

Mr. MARTIN. That is correct, Senator.

The CHAIRMAN. You are just developing more power, that is all?

Mr. MARTIN. Developing another watershed. So you would be on the Tennessee. You would develop additional water power on the Tennessee.

The CHAIRMAN. Probably. And if you could get power out of it, so much the better, but if you could not, you simply equalize the flow of the Tennessee River over the dam and you would have less water going over at the time it was going to waste, but more water when you could use it to develop power.

We will have to adjourn now until 10.30 to-morrow morning.

(Whereupon at 12 o'clock, noon, the hearing was adjourned to 10.30 o'clock a. m. Tuesday, April 18, 1922.)

MUSCLE SHOALS.

TUESDAY, APRIL 18, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in Room 224, Senate Office Building, Senator George W. Norris presiding.

Present: Senators Norris (chairman), Ladd, Kendrick, and Heflin.

The CHAIRMAN. The committee will come to order.

STATEMENT OF MR. THOMAS H. MARTIN—Resumed.

Mr. MARTIN. I will try to relate, Mr. Chairman, a consecutive story in a few minutes, growing out of the various investigations and reports which have to do with the improvement of the Tennessee River.

The CHAIRMAN. All right.

Mr. MARTIN. The rivers and harbors act of March 3, 1909, contained a provision for—

"Survey of Tennessee River from the confluence of the Holston and the French Broad Rivers to its mouth, with a view to securing the best permanent navigation by open-channel work or locks and dams, or both, and making an estimate of the cost of same, with a view to securing a depth from Knoxville to Chattanooga of 6 feet, if obtainable, or any such less depth as may be practicable between such depths and the present project depths; and from Chattanooga to the mouth of the river a depth of 9 feet, if obtainable, or such less depth as may be practicable between such depth and the present project depth."

This provision of the rivers and harbors act of 1909 was the basis for a survey of the upper reaches of the Tennessee River, and the result of this survey was transmitted by letter of the Secretary of War, of date December 29, 1911, to the Speaker of the House of Representatives, and is printed as a House Document, No. 360, Sixty-second Congress, second session, and is a very important document in connection with this whole subject.

The subject was considered by the district officer, Maj. William W. Harts, Corps of Engineers, by the division engineer, Lieut. Col. J. V. Warren, Corps of Engineers, and by the Board of Engineers for Rivers and Harbors, and transmitted with the indorsement of the Chief of Engineers to the Secretary of War under date of December 28, 1911. The report is the result of an exhaustive survey of the Tennessee River for a distance of 446 miles, from the confluence of the Holston and French Broad Rivers, 4½ miles northeast of Knoxville, to Riverton, 30 miles below Florence, Ala.

The report recommended the improvement of this stretch of the Tennessee River for navigation purposes by providing 3-foot navigation from Knoxville to Chattanooga; 6-foot navigation from Chattanooga to Riverton, with the exception of 37 miles of the Muscle Shoals stretch, and 6-foot open-channel navigation from Riverton to the mouth of the Tennessee.

The engineers made a most complete and detailed survey and submitted with the report an immense amount of data and information regarding the stream flow of the Tennessee, the water fall, the profile of the river illustrated by a number of maps, diagrams, and charts.

Among other things, study and investigation was made of the possibility of improvement of navigation and waterpower development by means of reservoirs and forestry. On page 40, under the subject of "Improvement by reservoirs and Forestry," the engineer reports as follows:

"IMPROVEMENT BY RESERVOIRS AND FORESTRY.

"It has often been stated of late that the improvement of streams may be effected most economically by means of immense artificial reservoirs in the headwaters, of such capacity that the greater portion of the winter's floods may be retained for a time; the water thus impounded to be released little by little during low stages so as to maintain greater depths in the streams below.

"This plan in theory combines several related benefits, including among others the reduction of flood heights, land reclamation, the creation of valuable water powers, and the clarification of the flow. Although plausible at first appearance, it presents many difficulties in application. One plan, seriously suggested, even proposed the construction of reservoirs in the headwaters of the Tennessee River capable of impounding over 715,000,000,000 cubic feet. This involved the erection of many high dams, one in the lower French Broad River having a height of upwards of 200 feet and a capacity of nearly 200,000,000,000 cubic feet, or more than four hundred times the capacity of the Johnstown Dam, the destruction of which caused such a disaster a number of years ago. It seems needless to point out that the great expense of such works and the time required before any useful results could be looked for in the stream below would sooner or later condemn this method.

"Furthermore, it is admitted that the benefits to navigation claimed to be obtainable by this method on the Ohio could never be fully achieved there without extensive contraction works and other costly adjuncts in the lower river. Similar works would also likely be necessary in the Tennessee River, the cost of which alone might easily amount to more than that of the improvement as now recommended.

"The successful operation and coordination of a system of widely scattered dams would present insuperable difficulties. The length of time required for the flow to reach the lower river from the reservoirs, certainly several weeks in the summer time, would render it necessary to operate them by guess work or on the averages of previous years, manifestly very unsatisfactory methods.

"In addition to these considerations, the insecurity of the dams themselves, the danger to life and property in case of a breach, the impairment of property values due to this risk, the uncertainty of beneficial results, and the likelihood that the reservoirs would sooner or later become filled with sediment, all combine to lead to the belief that, in addition to involving great and needless expense, this method is a most precarious one, and of doubtful utility.

"That it would incidentally develop water power of considerable value seems undeniable; but whether the needs of navigation and those of power production would always correspond is open to serious question. That the reservoirs might be so controlled as to reduce floods somewhat is conceded; but the combination of several widely differing utilities under a single management is not always best for those who bear the expense of the original undertaking.

"On the upper Mississippi, in Minnesota, there was established by the United States in the seventies a reservoir system which is the greatest in the world in capacity, the aggregate storage amounting to upward of 93,000,000,000 cubic feet. The benefit to navigation resulting from this system is so slight as to render the maintenance of the works a matter of questionable economy; but the power development rendered possible thereby—for private use—has always been an active argument for continuing the system in operation. It is safe to say that if navigation interests alone were to be considered no engineer to-day thinks of recommending such a system, notwithstanding the unusual advantages offered by the physiography of the region embraced by the Mississippi headwaters.

"A board of engineers in 1873, when investigating plans for the improvement of the Ohio, examined this reservoir method with great care and abandoned it as unlikely to yield certain and efficient results. In 1887 another board of engineers after a study of the reservoirs on the headwaters of the Mississippi refused to recommend the extension of the system for the improvement of the Wisconsin, Chippewa, and St. Croix Rivers; and in 1909 the method was rejected for the improvement of the Mississippi.

"As an accessory it may have some value, but owing to its great cost, the uncertainty of obtaining satisfactory results, the danger to life and property, the length of time necessary for the installation of the works, and the difficulty of operating them even after completion, this method as an exclusive means has been generally abandoned and is believed to be unworthy of consideration

for the improvement of the Tennessee River. It may be broadly stated that no hope of reducing the cost of improvement in this way can be entertained."

Col. William T. Russell, Corps of Engineers, and senior member of the Board of Engineers for Rivers and Harbors, concurred in the statements of the district engineer in the following language (p. 170 of the report):

"In compliance with law the board reports that there are no questions of terminal facilities, water power, or other subjects so related to the project proposed by it that they may be coordinated therewith to lessen the cost and compensate the Government for the expenditures involved."

The result was that the reservoir plan was definitely abandoned, as no relief or assistance of any kind was apparent from its installation. The district engineer, the division engineer, the Chief of Engineers, and the Board of Engineers for Rivers and Harbors all concurred in the recommendation that no project be submitted for the improvement of the Muscle Shoals stretch of the river in view of a resolution by the Rivers and Harbors Committee of the House directing the Board of Engineers for Rivers and Harbors "to submit as soon as practicable a revised report and estimate of the cost of construction of the necessary locks and dams for the improvement of said river and the development of water power in connection therewith as proposed by the Muscle Shoals Hydro-Electric Power Co., together with a detailed plan of cooperation between said company and the United States, such report and plan to state the equitable amount that the Government of the United States ought to contribute to such work."

The investigation and survey pursuant to the last-mentioned authority was in progress and was transmitted to Congress by the Chief of Engineers on May 18, 1914, being entitled House Committee Document 20, Sixty-third Congress, second session.

The CHAIRMAN. Is that all they say about it?

Mr. MARTIN. No. There is a very elaborate report.

The CHAIRMAN. When was that report made?

Mr. MARTIN. That report was made in 1911.

The CHAIRMAN. They do not tell us in there what they investigated on the Tennessee River?

Mr. MARTIN. Yes, sir; it is all here.

The CHAIRMAN. Is it? Their statements thus far are rather of a general nature. Of course it is conceded if on investigation it is found that these reservoir sites are going to cost too much, or that they can not impound enough water, they would not be considered. Some of the reasons they give there I think are good and some of them are not. It seems to me in some of them they are arguing like an attorney who has a bad case, trying to make it as good as possible. They are afraid if we build these dams, for instance, that they will go out some time and kill somebody. That is true of every dam.

Mr. MARTIN. Yes sir.

The CHAIRMAN. If that is going to prevent us we must tear out all the dams we have for any development, either navigation or power, because they are liable to go out some time, and when they do they will do some damage. The same argument would obtain to the railroads, because they kill people sometimes, and it would be sure to do away with the automobile.

Mr. MARTIN. Let us waive the question, for the moment, of safety. The question which he does introduce here is the length of time required for the flow to reach the point of use.

The CHAIRMAN. I do not believe there is anything in that argument. We have dams now in irrigation systems. They know within two hours how long it will take the water which they let out at a certain place to reach another place hundreds of miles below the stream. They can tell accurately just exactly when it is going to get there, and they do it as a practical proposition in irrigation systems.

Mr. MARTIN. Now, consider that this proposed reservoir is 450 miles from the Muscle Shoals—

The CHAIRMAN. Well, I don't know how far it is going to be. It can be that far, and it may be less.

Mr. MARTIN. If you consider that, as disclosed by these reports, then you have for 188 miles distance a fall of 0.96 foot per mile; for 140 miles distance 0.4 of a foot. Your water is going to flow not more than a mile an hour over this distance.

The CHAIRMAN. Yes.

Mr. MARTIN. So you have got approximately 450 hours to 500 hours. In other words, you have twenty days, we will say, before your water is going to reach the point of use so far as power goes in the Muscle Shoals.

The CHAIRMAN. Yes.

Mr. MARTIN. Then the question is to what extent can you count upon that water 20 days hence being available for generation of power at Muscle Shoals. That is the real question.

The CHAIRMAN. You can count on it to almost a certainty. Of course, in the meantime there might be a storm along the river that would increase the flow a great deal, and there might be a real hot wind and it will evaporate more of it. Those things you will have to contend with. But by a little experience, if we had the dams constructed, we would know absolutely just how much to let out.

Mr. MARTIN. Well, that is a question of whether it can be adjusted to the point of having the water available at the moment when it is needed to produce power to supplement the low stream power.

The CHAIRMAN. Yes.

Mr. MARTIN. That is the problem that was brought forward in these reports. It became evident that this plan was laid to one side and some other plan was sought, and the other plan came along with a consideration of reservoirs, which would not supplement the water flow of the Tennessee, but would supplement the power.

The CHAIRMAN. I am not finding fault with that at all. That is all right. Get power however you can and wherever you can get it the cheapest. But here is a whole lot of possibility in the way of development of power, and a large proportion of that power is secondary.

Mr. MARTIN. Yes, sir.

The CHAIRMAN. If you could equalize the flow of the river just a little bit you could change the secondary into primary power and double its value. Regardless of whatever power you may have to develop in the vicinity, that is a good thing to do, if you can do it.

Mr. MARTIN. You ought to develop the power by these reservoir sites.

The CHAIRMAN. We have the dam constructed, the machinery put in, and everything there. All you need is more water. Sometimes you have too much water and sometimes not enough. If you can devise a scheme by which you can hold it back when you have too much and let it out when you have not enough you are going to be able to utilize the machinery and expensive works that we have already established that must be maintained anyway.

Mr. MARTIN. Of course, when you come to the reservoir sites, if you have a power plant, generate power—

The CHAIRMAN. Yes.

Mr. MARTIN. You will avoid these uncertainties as to whether your water is going to reach the point when needed if you have a power plant at the reservoir site connected with your main power plant by transmission system.

One of the serious questions which would arise right there would be this, that those reservoir sites are located 450 miles, approximately, from the Muscle Shoals development. Then, the question is, where is your load center of the use of that power from the Muscle Shoals going to be. If it is in the direction of these reservoirs, in northeast Tennessee, at an intermediate point, then your reservoir system would have great value. If, on the other hand, your load center is south, your question changes again. That was one of the problems with which the engineers were confronted in their investigation. The load centers, as we feel, and as the later investigations show, would be in Alabama, in the mineral districts.

The CHAIRMAN. Probably you are right about that; but there are great possibilities that at some time Tennessee will use power—Nashville, Chattanooga, and other places that will spring up.

Mr. MARTIN. In the mineral districts, of course, is where the greatest use of power will take place, either at Muscle Shoals or other places.

The CHAIRMAN. You think you could probably manufacture in this district, assuming you would have the power and transportation system?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. And if you develop the navigation and the power together?

Mr. MARTIN. Yes. They would unquestionably develop the country, and you might develop a great manufacturing district at the Muscle Shoals, in which case it is still 450 miles from your reservoir.

The CHAIRMAN. Suppose a manufacturing district developed near Chattanooga. That would be at the head of 6-foot navigation when the navigation

plans were carried out. Then you would have that located at a more central place.

Mr. MARTIN. If this were the only power that that neighborhood could draw from, that is true. Of course there are a number of powers developed around Chattanooga, and they will always be available at Chattanooga. The Muscle Shoals power will supplement those powers at Chattanooga, but Chattanooga would not depend entirely upon it.

The CHAIRMAN. I suppose it is in time the hope of engineers, modern engineers, is it not, that all these powers will be intertwined so that they will supplement each other?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. It is not going to make so much difference where your power is developed; it will become part of a great system that will extend over a very large section of the country with a view of using all your power all the time.

Mr. MARTIN. Yes, sir; that is true, Senator.

The CHAIRMAN. And that is a great economy.

Mr. MARTIN. I might just mention to you that during the last eight months that very question was very strikingly illustrated in the Southeastern States, where six States with transmission systems are interconnected. There was a power shortage in certain sections. Down in Alabama we did not have the extreme shortage, for instance, that prevailed in the watershed northeast of Atlanta. The result was that our system was able to furnish substantial amounts of power to the Georgia Railway & Power Co. for use in and around Atlanta, in another watershed. It gave us greater use of the water and reached the very question you are suggesting.

The CHAIRMAN. In other words, it was a help to both of you?

Mr. MARTIN. Yes; both.

The CHAIRMAN. That is real economy; that is efficiency.

Mr. MARTIN. In addition to that we used to greater advantage the Warrior steam plant, and that, plus whatever balance of water we had in the Coosa River, enabled us at times to supply the Georgia Railway & Power Co. as high as 30,000 horsepower daily for use in the Georgia district. In addition to that there was still a further shortage of power 600 miles away in the Carolinas, and we were enabled to pass the power on to the Georgia Railway & Power Co., and they in turn to another company, and finally it benefited industries and the public as far as 600 miles away in North Carolina, to industry, cotton mills, and what not, that had been closed, and public utilities, which resumed partial operation on power which came from Alabama.

That is the result of this interconnection.

Going back a moment, then, to this question of the Tennessee River, following the report to which I have referred, document 360, there was another direction to make a still further survey of what could be done with the Muscle Shoals stretch of the river. That investigation and survey led to what is known as House Document No. 20, Sixty-third Congress, second session.

Now, I might mention also that by the rivers and harbors act of March 3, 1909, the Congress authorized the survey of the Etowah, the Coosa, and Tallapoosa River in Georgia and Alabama, and the result of that survey is reported in House Document No. 253, Sixty-third Congress, first session, which is a very interesting document.

The result of House Document 253 was that the Government engineers reported further on certain impounding reservoirs of the Tallapoosa River with a view of benefiting both power and navigation, those reservoirs being within 50 miles of the Alabama River, which it was mainly intended to supplement.

Following that report, then, various of the citizens of Alabama who were interested in this whole Muscle Shoals question, conceived the plan again of developing the Muscle Shoals in coordination with this Tallapoosa River watershed, creating impounding reservoirs on that river and creating power developments there and tying that power development with the power development at the Muscle Shoals on the Tennessee River. A plan was then submitted to the engineers of the United States by the Muscle Shoals Hydroelectric Power Co., which company was one of the companies related in ownership in this proposed scheme of developing the Cherokee situation along with the Muscle Shoals, and a plan was submitted, and on page 34 of this report I will just quote this brief extract:

"The large amount of power developable from water stored in the two reservoirs"—

One at Cherokee and one at Little River—

"can be called on to make up deficiency in power at the power houses of the Muscle Shoals development during the seasons of low flow. It is this fact alone that enables the power company to plan for a development of the Muscle Shoals potential power to the extent of the ultimate installation proposed, i. e., 680,000 horsepower at the switchboards of the two power houses. * * * The board believes that none of the developments, when taken singly, will be nearly so valuable as a conservator of natural energy as when combined in some such manner as that proposed by the power company. Such a 'combination' of power plants, if suitably 'regulated' by State or Nation, will be of far greater public benefit than a number of independent power plants with incomplete development at each plant."

To illustrate what it would mean to develop these three separately without the supplementing effect of the reservoirs, this report further showed that the proposed saving per year by combining the Muscle Shoals, Tallapoosa, and Little River projects would ultimately amount to 10,000,000 short tons of coal.

The CHAIRMAN. Annually?

Mr. MARTIN. Annually.

Treating these three projects separately and operating them separately would result in a saving of 5,000,000 short tons. It would almost double the effect.

Senator HEFLIN. What does this coal cost at the mines?

Mr. MARTIN. The cost at the present time is \$2.35, Senator; from there on up to something over \$4.

Senator KENDRICK. What amount of power do you lose in transmission, Mr. Martin? You spoke yesterday of the cost of transmission and the loss of power involved in the long distance. Is there a proportionate amount of loss according to the distance?

Mr. MARTIN. Not necessarily according to distance. It will depend upon the voltage and how many times it may be stepped down. I might mention that the longest distance that our company is transmitting power direct in Alabama is 225 miles from our water-power plant. That goes at 110,000 volts to one station, then is reduced to 44,000 volts and carried 75 miles away at that voltage, and when it gets to the point of use we have lost about 12 per cent.

Senator KENDRICK. And is the loss based upon the distance it must be carried?

Mr. MARTIN. If we were transmitting that power at 220,000 volts we would probably lose 5 per cent.

Senator KENDRICK. Then the distance it must be carried affects only the cost of the transportation line involved in the transmission of the energy?

Mr. MARTIN. Yes. When you get to distances of 400 miles you have about reached the limit for straightaway transmission as now practiced.

Senator HEFLIN. Improved methods of transmission may be used?

Mr. MARTIN. By relaying and interconnected power plants. For instance, we transmitted power last fall in Alabama to one company and that company in turn to another company, all for the purpose of supplementing power 600 miles away.

This combination of power systems which is described in Document No. 20, to which I would refer the committee, shows that there would be approximately 500,000 horsepower prime power which could be made available from the combination of these three developments.

The CHAIRMAN. That is the Tallapoosa, Little River, and Muscle Shoals?

Mr. MARTIN. The Tallapoosa, the Little River, and Muscle Shoals, and it could be expressed in horsepower-hours if that were needed, but I think it does not need to be expressed in that form. Without the combination, and simply taking Muscle Shoals even on the average year, you would have even on the average year no more than 250,000 horsepower prime power. The result is a doubling of the prime power of Muscle Shoals.

Senator KENDRICK. Now, Mr. Chairman, I would like to ask a question there that may have been already included in the record.

The CHAIRMAN. All right.

Senator KENDRICK. Does the Federal Power Commission assume to regulate the reasonableness of the prices that you may charge for this power after you have leased the power plants from the Government?

Mr. MARTIN. It does regulate the rate charged by those who are licensees under the Federal water power act.

Senator KENDRICK. In other words, if the Alabama Power Co. were given the lease to this Muscle Shoals and other plants it would not constitute a monopoly of power in that country?

Mr. MARTIN. No; because we have no control over the price except in a very limited way. The commission fixes the price. And, Senator, the Federal water power act provides that rates, service, and security issues shall be regulated by the Federal Power Commission if there is no State regulation, and if the power enters into interstate commerce and the States can not agree, then it is regulated by the Federal Power Commission.

Senator HEFLIN. What authority is there in the State of Alabama for regulating power prices?

Mr. MARTIN. There is a very full and complete act of the legislature of 1920 regulating service, rates, and security issues of all public service companies, including water-power companies.

Senator HEFLIN. If you transmit power from Alabama to Georgia, and the authorities in Georgia and Alabama can agree on what the price should be, then the Federal Power Commission would not come in?

Mr. MARTIN. No, sir.

Senator HEFLIN. But if they should not be able to agree, then the Federal Commission comes in?

Mr. MARTIN. Yes, sir. And we are required by the terms of the Federal water power act to agree upon that form of regulation as a condition of the issuance of the license. That is one of the express provisions of the license.

Senator KENDRICK. As one member of the committee, Mr. Martin, it has occurred to me more than once since you began your testimony here that the Federal Government might find it advisable to retain control and ownership of the steam plant at Dam No. 2, for the purpose of making more permanent and secure or dependable the power involved in the secondary horsepower in order to insure, in other words, that it could continue operation in production, we will say, of nitrates; and it occurs to me for that reason it would be a good plan for you to include in your proposition a condition under which the Government might retain the steam plant that it now has, allowing you, of course, or your company, the right to build one of your own in case you should desire to do so.

Mr. MARTIN. Well, we assumed, Senator, in presenting our proposal, that it was in line with what might be the policy of the Government. If that is not in line, then it is necessary to reconstruct that proposal on a line that Congress might declare as its policy.

Senator KENDRICK. I would like that statement.

Mr. MARTIN. I have no doubt that the ultimate conclusion of the bargain could be worked out to carry out the principles of your statement.

Senator KENDRICK. My idea of negotiation is one in which each party involved has a right to change his mind and insist upon having conditions met.

Mr. MARTIN. As I stated, if the Government decides upon a different policy, I have no doubt a different proposition can be worked out. In presenting the plan we had no specifications, so to speak, of what Congress would lay down as its policy and in suggesting a plan we did not in any sense state a plan which was intended to be final or irrevocable. All of these things are subject to change.

Senator KENDRICK. Suppose, after we consider all of the propositions, we concluded yours was more favorable than the others, and we concluded that it would be a wise thing for the Government to retain this enormous investment in the nitrate plant rather than erecting it and junking it, and employ that 100,000 secondary horsepower furnished by your company in the manufacture of these nitrates, and to use this steam plant as an incidental power to make the whole system dependable and economical; then in that event it would be a good idea for you to have a proposition there submitted that would cover that situation.

Mr. MARTIN. Does your suggestion involve the financing of the construction by the Government?

Senator KENDRICK. No; I had in mind, assuming that you want the benefit of the power in the dam, that you will, if you want that, complete that dam, and the Government would be relieved of that; that the Government would be relieved from making any further investment, and would, as of the date of the completion of this dam and its equipment for use, be ready to proceed immediately on the production of this composition or chemical that enters into fertilizer, as an experiment.

Mr. MARTIN. We will be glad to go into the matter to see to what extent we could meet whatever views the Government might lay down. I might mention

this, Senator, that one thing that is very important here is the use of a large steam plant of that kind in the building up of a load, which would be available in a waterpower when completed. You remember and will bear in mind, of course, that there are large interest charges to be met as the development is completed. We must prepare a load, create a load to meet that interest charge. That is one of the serious reasons why we wanted the right to operate the steam plant.

Senator KENDRICK. Yes, sir; that is all right. My idea was not to deprive you of the use of it until you had replaced it with one of your own, if you found it necessary to do so; but, as I understand it, you are now leasing that plant from the Government?

Mr. MARTIN. Yes, sir; we are leasing that plant to supplement the needs of power in Alabama and to supplement the needs of power in the other South-eastern States during the present year, but that lease is subject to revocation by the Secretary of War at any time.

Senator KENDRICK. It will be very possible for the Government to allow you, under conditions satisfactory that may be included in the contract, to continue the use at least of a part of this power during the time that you require it, if you find it necessary to do so at all in substituting this plant for one of your own.

Mr. MARTIN. There are certain demands for power in the localities which would be reached from Muscle Shoals, running as high as 25,000 to 30,000 horsepower, which must be met within a reasonable time. I have in mind one large community. The operators of the utilities of that community are going ahead—must go ahead—to meet the required needs, to build a new steam plant unless this source of power is made available within some reasonable time, and such operations as that are involved in this whole big problem.

The CHAIRMAN. To what cities do you supply power, or municipalities, for light for houses and for general purposes of lighting, and such power as ironing, washing, etc.?

Mr. MARTIN. There are 63 municipalities in Alabama, Mr. Chairman, that either directly or indirectly receive lighting and power from our system.

The CHAIRMAN. Do you supply them directly through the city systems in Montgomery, for instance?

Mr. MARTIN. No, sir; that community happens to have a local plant, the Montgomery Light & Power Co., in which we have no interest.

The CHAIRMAN. That is another middle man?

Mr. MARTIN. They have their own utilities there.

The CHAIRMAN. And you sell to them?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. And they sell to the city?

Mr. MARTIN. Yes, sir; they sell to the city or, rather, sell to the public.

The CHAIRMAN. Under a charter, I suppose?

Mr. MARTIN. Under a franchise. In other communities we sell to the city as distributors.

The CHAIRMAN. Take one where you sell to the city as distributors.

Mr. MARTIN. Opelika.

The CHAIRMAN. How large a place is that?

Mr. MARTIN. About 10,000.

The CHAIRMAN. What is your charge to the city?

Mr. MARTIN. The standard rate that we charge—I might mention that our lighting rates are 9 cents. That is the highest. In that particular community the charge to the consumer is 12 cents.

The CHAIRMAN. What I am trying to get at is what do you charge? You sell it to the city and the city itself does the distributing?

Mr. MARTIN. Yes.

The CHAIRMAN. And owns the distributing plant, does it?

Mr. MARTIN. Yes.

The CHAIRMAN. Now, then, first what do you charge the city?

Mr. MARTIN. The scale of prices will run on our standard chart of rates something over 1 cent per kilowatt hour. It is somewhere around 8 mills to 1½ cents a kilowatt hour, depending upon use.

The CHAIRMAN. What does the city charge its citizens?

Mr. MARTIN. The city charges for lighting use 12 cents. That is my understanding.

The CHAIRMAN. They must make a tremendous profit?

Mr. MARTIN. The distribution expense is very large.

The CHAIRMAN. I know something about it, but it ought not to cost that. If you sell to them for less than a cent, and they charge 12 cents, they must be making lots of money.

Mr. MARTIN. They are simply making their interest and operating expenses.

The CHAIRMAN. Do you mean to say that the distributing expense of a city of 10,000 people will amount to as much as 10 cents per kilowatt hour?

Mr. MARTIN. I would not like to say, Senator, that it would amount to as much as that.

The CHAIRMAN. Don't you know that it is true that it does not amount to anything like that in cities that large? I can conceive a city scattered over half a State in which that would be true, but the ordinary city, on the average—

Mr. MARTIN. It probably does not. We charge 9 cents as a maximum anywhere.

The CHAIRMAN. Where you sell to the consumer?

Mr. MARTIN. Yes, sir; that is the maximum rate.

The CHAIRMAN. Then it is a sliding scale, is it?

Mr. MARTIN. Nine cents on down; yes, sir.

The CHAIRMAN. When does it commence to go down. How fast does it go down?

Mr. MARTIN. For the first 100 kilowatt hours, as I recollect, it is 9 cents, then it steps down to 7 cents, then it steps down to 5 cents, and finally, for large users, it goes down as low as 5 mills.

The CHAIRMAN. I suppose you are an expert on that. Do you happen to know what the charge in the city of Cleveland in the municipally owned electric light plant, is?

Mr. MARTIN. I can not qualify as an expert, Senator. I don't know.

The CHAIRMAN. I assumed that you were an expert.

Mr. MARTIN. I do not recall those rates. There are a number of cities in Alabama that have their own distribution systems—several cities.

The CHAIRMAN. And do they all charge their own citizens as high as 12 cents and get it from you at less than 1 cent?

Mr. MARTIN. I don't think there are any towns that charge their patrons less than 12 cents. We are under regulation as to our rates of service and municipalities are not, as you understand.

The CHAIRMAN. Well, I assume municipalities being administered by the people would not make a big profit out of it.

Mr. MARTIN. Well, I don't think they do make a big profit out of it.

The CHAIRMAN. There is something wrong if they pay you for their electricity less than a cent and sell it to their people for 12 cents. There can not be any question about that, it seems to me.

Mr. MARTIN. Well, of course, there are certain expenses which in a large system are distributed over the service to a large number of people, and thereby supply service to the consumer cheaper than a municipality could get it to a limited number of people. You will remember that a city may have 500 users, maybe 1,000, whereas we have, directly or indirectly, 60,000 consumers. That makes a vast difference when it comes to a question of distributing the overhead and general expenses.

The CHAIRMAN. I know in a general way about what the cities over the United States pay, what the consumers pay. Is it not true that there are very few of them that pay as high as 12 cents?

Mr. MARTIN. No, sir; I believe not, Mr. Chairman. We have some communities in our State that charge their public as high as 20 cents per kilowatt hour.

The CHAIRMAN. I can conceive of conditions under which that might be justified, but I am speaking in general, where the normal conditions exist, in the ordinary city. Do you know of any? Even in Washington, where we have an underground system, which everybody concedes is much more expensive than an overhead system, they only charge 10 cents, as I remember it.

Mr. MARTIN. That is operated by a public utility company in Washington.

The CHAIRMAN. Yes.

Mr. MARTIN. Of course, I am not definite in this statement, but I think you will find that public service utilities companies upon the whole charge the public less than a municipal corporation throughout the United States.

The CHAIRMAN. Of course, there may be chances for great disagreement in that respect. I don't believe that. You may be right about it. We will not argue that. But it does not make any difference whether it is a municipality

or a private corporation, if they are buying their electricity for less than 1 cent per kilowatt hour and selling it to their people for 12 cents, it seems to me they are profiteering. There is something crooked somewhere in it. It does not seem to be possible without some great loophole, some graft in it somewhere. That is more than it is out in the West where we ship the coal two or three thousand miles and make electricity with coal.

Mr. MARTIN. There are a number of municipalities in Alabama that take service from our system, and I think none of them charge the public less than 12 cents.

Senator HEFLIN. Do you supply any city that in turn supplies other cities around it?

Mr. MARTIN. No, sir.

Senator HEFLIN. For instance, you sell power to Opelika, and does Opelika then resell it to Roanoke or Camp Hill?

Mr. MARTIN. No, sir.

Senator HEFLIN. You sell to the municipality direct?

Mr. MARTIN. We sell it direct to Lafayette, your home town, and Opelika.

Senator HEFLIN. You are supplying Lafayette now?

Mr. MARTIN. Yes, sir; and Piedmont, and Sylacauga, and some other towns in Alabama.

The CHAIRMAN. Senator, do you know what the rate is in your town?

Senator HEFLIN. No, sir; I don't. We had our own power plant which operated for a number of years. I don't know whether this arrangement is cheaper than the power we obtained from our own plant or not.

Mr. MARTIN. I think you will find that it is, because your mayor and council were quite anxious for us to come in there and supply them with service. We extended our line from Roanoke to Lafayette and are supplying the city and supplying your cotton mill, and the erection of the cotton mill last year was the result of our going there and making power available.

Senator HEFLIN. Have you got the figures there? Do you know what the figures are?

Mr. MARTIN. I have not the figures here. I can get them.

Senator HEFLIN. I wish you would do that and put them in the record.

Mr. MARTIN. Going back to House Document 20, Mr. Chairman, that document came to Congress in 1914, with the suggestion that unless the proposed plan of development in cooperation with the Muscle Shoals Hydroelectric Power Co. was adopted, that the sum of \$150,000 be appropriated for further surveys. The plan was not adopted by Congress, but appropriation of that amount was made, which resulted in further and elaborate study of the question, and that again is reported in House Document No. 1262, Sixty-fourth Congress, first session, which is a most complete report on this whole subject, and again the whole plan of cooperation with the Muscle Shoals Hydroelectric Power Co. was favorably reported, but with the further recommendation that action upon that proposal be suspended until it was determined whether the President would select the Muscle Shoals site, or one of them, for development in connection with the nitrate problem.

In that report it was again specifically recommended that this plan of development go forward in cooperation with the storage development in Alabama, subject to the provision that the President should select the site. The President selected the site. I would like to hand to the reporter certain excerpts from these reports which I will not take the time to read.

The CHAIRMAN. All right.

Mr. MARTIN. The following is a brief summary of House Document No. 20, Sixty-third Congress, first session:

The document consists of a letter from the Chief of Engineers dated May 18, 1914, to the chairman of the Committee on Rivers and Harbors of the House, transmitting a report of the Board of Engineers for Rivers and Harbors on that part of the Tennessee River between Browns Island and the railroad bridge below the city of Florence.

Bids were invited by the board for cooperation by water-power companies in the development and the plan of the Muscle Shoals Hydroelectric Power Co. was recommended as the most advantageous to the United States. Among other provisions the board recommended that some suitable provision should be made whereby the United States would have the right to terminate the water-power lease at any time at the end of 50 years.

The plan proposed by the Muscle Shoals Hydroelectric Power Co. was to develop the Muscle Shoals power in connection with storage plants on the Talla-

poosa and Little Rivers, and in the course of a letter from Colonel Black, the senior member of the Board of Engineers for Rivers and Harbors, to the Chief of Engineers, of May 5, 1914, it was said, page 5:

"12. The Muscle Shoals Hydroelectric Power Co. has interests in other power developments on the Tallapoosa, the Coosa, and the Little River. Connecting these developments with the proposed Muscle Shoals development will make up deficiency in power at the latter place during the seasons of low water. This fact alone enables the power company to plan for an ultimate installation at Muscle Shoals of 680,000 horsepower, measured at the switchboards. The special board states that such a combination of power plants, if suitably regulated by State or Nation, will be of far greater public benefit than a number of independent power plants, with incomplete development at each plant."

The question was further discussed in the letter from the board of engineer officers to the Chief of Engineers dated February 23, 1914, in the course of which it was said:

"40. *Relation to other developments.*—The studies of the board indicate that when the Muscle Shoals section of the river is considered separately from developments elsewhere the present economical maximum development of the potential power will not greatly exceed that produced by the installations included in the plans of the board. At 72 per cent efficiency the maximum power produced by the suggested installation is about 215,000 horsepower, measured at the switchboard, and with the 80 per cent efficiency assumed by the power company, is about 237,500 horsepower.

"The Muscle Shoals Hydroelectric Power Co. has either under construction or is interested in other developments, viz, at Cherokee Bluffs, on the Tallapoosa, where it is proposed to construct a high dam with available storage capacity of about 50,000,000,000 cubic feet and with working-power head varying from 93 to 146 feet; on the Little River, where it is proposed to form a reservoir with available storage capacity of about 4,800,000,000 cubic feet and with working-power head varying from 515 to 585 feet; and several developments on the Coosa River in connection with the navigation improvement of that stream, one of which (at Lock 12) is now approaching completion. The large amount of water developable from water stored in the two reservoirs can be called on to make up deficiency in power at the power houses of the Muscle Shoals development during the seasons of low flow. It is this fact alone that enables the power company to plan for a development of the Muscle Shoals potential power to the extent of the ultimate installation proposed, i. e., 680,000 horsepower at the switchboards of the two power houses. It is not believed to be necessary to describe in detail the relation of the different power developments proposed by the power company, but in this connection attention is invited to Appendix G, which is the statement furnished to the board by the power company in connection with its proposal. The board believes that none of the developments when taken singly will be nearly so valuable as a conserver of natural energy as when combined in some such manner as that proposed by the power company. Such a 'combination' of power plants, if suitably 'regulated' by State or Nation, will be of far greater public benefit than a number of independent power plants with incomplete development at each plant."

The proposal of the Muscle Shoals Hydroelectric Power Co. was embraced in its letters of December 10, 1913, and January 1, 1914, which are as follows:

MUSCLE SHOALS HYDROELECTRIC POWER CO.

Nashville, Tenn., December 10, 1913.

Col. W. C. Langftit and Members of the United States Engineer Board on the improvement of the Muscle Shoals section of the Tennessee River, United States Engineer Office, Nashville, Tenn.

SIRs: The Muscle Shoals Hydroelectric Power Co., with further engineering studies and investigations of the joint navigation-power improvement of the Muscle Shoals section of the Tennessee River, conducted during the past six months of extended time granted by your board, by your circular dated 25th of June, 1913, is now pleased and prepared to submit to your board the following suggestions and proposals:

Of the three methods named in your circular as acceptable to you for receiving bids, the Muscle Shoals Hydroelectric Power Co. selects and proposed upon a combination of the first two methods.

The following bid of this company is based upon lease of 100 years, and for the following reasons:

1. The Muscle Shoals Hydroelectric Power Co., in the light of its own experience, feels that a project of this magnitude, involving such large financial negotiations, can not be financed on any successful basis with a period shorter than 100 years.

2. Hydroelectric, more than any other class of industrial investments, must bear a trying interest burden over a longer nonrevenue initial period of construction.

3. The hazards of a hydroelectric investment are greater than in any other class of investments.

4. In proportion as the lease period is shortened, in like proportion bond issues on such development are with greater difficulty and more expensively negotiated.

5. Electrochemical and electrometallurgical operations, upon which power developed at Muscle Shoals must rely for consumption, require and must secure power at extremely low rates covered by long-period contracts.

In the final preparation of this proposal the Muscle Shoals company has, at its expense, added to the earlier engineering investigations and reports covering a period of six years prior to your circular of June 25, 1913, further studies, surveys, soundings, and estimates, and transmits the result thereof to your board in the form of maps and drawings, trying in its work with the surveys of the Corps of Engineers, United States Army, wherever practicable. The result of the engineering studies and investigations by the Muscle Shoals company during the past six months has confirmed the conclusion suggested to your board of June 24, 1913, that the most feasible and economical plan for the joint improvement of navigation and development of power at Muscle Shoals is with two power dams instead of three, the lower dam being located on the site designated by your board as "No. 2" and the upper dam on the site designated by your board as "No. 4"; the lower dam site, No. 2, to have a crest elevation of 500, with the tail-water at 400.5; the upper dam, at site No. 4, to have an elevation of 540 for the top of the movable crest and 528 for the top of the fixed portion of the dam.

Our engineering studies and investigations, now running over six years, and especially the investigations we have made during the past six months, support the estimate which we have made that the cost of lands, dams, locks, power-house substructures, and miscellaneous and engineering expenses, in connection with these items, together with a contingent and interest fund of \$1,000,000, will be \$17,349,100. Our plans are based on the gravity dam, sections, adopted by your board for Dams Nos. 2 and 4, and upon unit prices, which we believe, in the light of our recent experience, are more than ample, and which we hope and believe will commend themselves to you as safe.

The Muscle Shoals Hydro-Electric Power Co. respectfully submits to your board the following proposals based upon the conditions therewith stated:

1. That the Government shall complete the dam at site No. 2 and the appurtenances thereto mentioned above and permanently raise the waters behind the said dam to the level of the spillway thereof within four years after the date of the first appropriation made for the carrying out of the project and not later than the 1st of January, 1919, and for a sufficiently long period of time prior to that date give entrance to the Muscle Shoals Co. for the completion by it at its expense of the power-house superstructures and the initial hydraulic and electrical equipment by that time.

That the Government shall complete the dam at site No. 4 and the appurtenances thereto mentioned above and permanently raise the waters behind the said dam to the level of the spillway thereof within five years after the date of the first appropriation made for the carrying out of the project and not later than the 1st of January, 1920, and for a sufficiently long period of time prior to that date give entrance to the Muscle Shoals Co. for the completion by it at its expense of the power-house superstructures and the initial hydraulic and electrical equipment by that time.

2. The Muscle Shoals Co., upon the completion of the dam at site No. 2 and the appurtenances mentioned above and the permanent raising of the waters behind said dam to the level of the spillway thereof, will pay to the Government the sum of \$3,000,000 in cash as its first contribution to the cost of the lands, docks, dams, and substructures.

3. The Muscle Shoals Co., within a period of 100 years from the completion of the dam at site No. 2 and appurtenances thereto mentioned above and the

permanent raising of the waters behind the said dam to the level of the spillway thereof, will repay to the Government as its second contribution for lands, locks, dams, and substructures \$7,000,000 by an annual payment of sinking fund and interest, taken at the approximate rate of 3 per cent per annum and in specific amounts, to be paid as follows:

At the end of the first year after the completion of the dam at site No.

4 and the appurtenances thereto mentioned above and the permanent raising of the water behind said dam to the level of the spillway thereof -----	\$75,000
At the end of the second year-----	125,000
At the end of the third year-----	150,000
At the end of the fourth year-----	175,000
At the end of the fifth year-----	200,000
And each year thereafter to the close of the 100-year period-----	240,000

4. The Muscle Shoals Co., as its third contribution in aid of navigation, will pay to the Government each year an amount equivalent to 30 cents per horsepower of installed capacity measured on the switchboards of the power house. Such payments shall begin at the end of the first year after the said installed capacity shall exceed 200,000 horsepower, but not later in any event than at the end of 20 years from the beginning of the said 100-year period, and shall continue to the end of the said period.

5. The Muscle Shoals Hydro-Electric Co., upon the invitation of the United States Government at any reasonable time prior to the expiration of the said period of 100 years, will undertake negotiations with the Government looking to a renewal of this lease. In the event of failure to agree upon terms this lease shall terminate at the end of said period of 100 years, and the Government shall then take possession of all the property of the Muscle Shoals Co., the value of which may be dependent upon the right to develop water power under this lease, and shall pay to the Muscle Shoals Co. a price which may have been previously agreed upon between the parties, or in the event of failure to so agree the Government shall pay for such property a fair value, to be determined by condemnation proceedings usual in the States wherein the property is located. The Government, furthermore, on taking possession shall assume all the contract of obligations of the Muscle Shoals Co. that may have been previously submitted by the Muscle Shoals Co. to the Government for approval and which within a reasonable time after such submission have not been disapproved of by the Government.

6. Repairs, maintenance, and operation of dams, power houses, substructures, superstructures, machinery, and appliances shall be at the expense of the Muscle Shoals Co. during the 100-year period. Repairs, maintenance, and operation of the locks shall be at the expense of the United States Government during the 100-year period.

7. The Muscle Shoals Co. will furnish the United States, free of charge, delivered to the lock grounds, electric power not to exceed 100 horsepower.

The board has asked that each bidder shall inclose with his proposal sufficient evidence to show what financial backing he may have, in order to enable the board to give proper weight to his proposal. The financial interests which are the support of the Muscle Shoals Hydro-Electric Power Co., and the owners of its securities, are engaged on a large scale in the development and operation of water powers in South America, Mexico, United States, and Canada, and as large investors in industries requiring great amounts of hydroelectric energy. Their developments of this nature going forward at the present time involve an investment of about \$15,000,000. Representatives of the company will be pleased to state verbally to your board on presentation of this proposal such additional definite information as can not properly be conveyed in a document of a more or less public nature.

We believe it is proper and pertinent to call the attention of the board to what we conceive to be the three factors of exceptional strength involved in this company's proposal.

1. It is a plan by which, through the development of water power, the United States Government is repaid all of its expenditures for navigation and water-power development and becomes the sole possessor of all the things for which that expenditure was made.

2. It is a plan by which the normal high-water flow of the stream is conserved to an extent which makes feasible the development of two or three times as

much power at Muscle Shoals as could otherwise be developed. This is possible only through combining with the Tennessee River development, subject each hour of the day to the vagaries of the flow of that stream, this company's proposed water-power developments on the Tallapoosa and Little Rivers, with their extraordinary storage reservoirs. It is estimated that the maximum installed capacity practicable by these combined developments will be approximately 680,000 horsepower, while that practicable by the use of the waters of the Tennessee River at Muscle Shoals alone would be approximately 200,000 horsepower. Under this plan of combination the normal high-water flow of the Tennessee River at Muscle Shoals is conserved, which under any other plan of development would reduce the available developed power to dependence upon the low-water flow.

3. This plan contemplates the application of a material part of the power to be thus developed to the manufacture of an agricultural fertilizer through the fixation of atmospheric nitrogen, an industry in which there has been in four years of commercial life approximately \$80,000,000 invested, and for the development of which the fundamental requirement is cheap, continuous power and plenty of it.

If the joint navigation-power development at Muscle Shoals can be accomplished so that there will result a large volume of continuous cheap power, the manufacture of agricultural fertilizers through the fixation of atmospheric nitrogen should be possible on a scale adequate to afford the farmers of this great country advantages comparable to those enjoyed by European farmers.

If the board feels possibly that the Muscle Shoals Hydro-Electric Power Co. has in its proposal gone beyond the limitations of the resolution passed by Congress under which the board is working, we rest our excuse, if any be needed, upon purpose No. 2 of the joint resolution passed by Congress authorizing the creation of your board by the War Department.

Respectfully submitted.

MUSCLE SHOALS HYDRO-ELECTRIC POWER CO.,
J. W. WORTHINGTON, *President*.

MUSCLE SHOALS HYDRO-ELECTRIC POWER CO.,

Nashville, Tenn., January 1, 1914.

Col. W. C. Langfitt and Members of the United States Engineer Board on the Improvement of the Muscle Shoals Section of the Tennessee River, United States Engineer Office, Nashville, Tenn.

SIR: This communication is proposed to your board as an addendum to the proposal made to your board by the Muscle Shoals Hydro-Electric Power Co. under date of December 10, relative to cooperation between the United States Government and the Muscle Shoals Hydro-Electric Power Co. for the joint navigation power improvement of the Muscle Shoals section of the Tennessee River.

The estimates submitted by the Muscle Shoals Hydro-Electric Power Co. accompanying its proposal of December 10 did not include, and we did not intend our proposal to include, the cost of the navigation dam designated by your board as Dam No. 1, with location just above the Florence Bridge, estimated to cost approximately \$1,000,000.

In submitting this amendment to our proposal of December 10, the Muscle Shoals Hydro-Electric Power Co. proposes as follows:

1. That if Dam No. 1 may be used in a dual capacity, chiefly and necessarily for navigation, and contingently establish a regulation pool below the navigation and power dam at site No. 2, the Muscle Shoals Hydro-Electric Power Co. may have the right to use such regulating pool.

2. In consideration of the use of the pool to be formed behind Dam No. 1, the Muscle Shoals Hydro-Electric Power Co., at its third contribution in aid of navigation, will pay to the Government each year an amount equivalent to 35 cents per horsepower of installed capacity measured on the switchboards of the power houses, instead of 30 cents per horsepower as provided in our original proposal of December 10.

3. The Muscle Shoals Hydro-Electric Power Co. will furnish to the United States free of charge, delivered to the lock grounds of Dam No. 1, electric power not to exceed 50 horsepower, for the operation of the navigation facilities at Dam No. 1. All repairs, maintenance, and operation of Dam No. 1 and the lock appurtenant thereto shall be at the expense of the United States Government.

In all other respects this addendum to our proposal of December 10 shall subscribe to all of the conditions set forth in that proposal.

Respectfully submitted,

MUSCLE SHOALS HYDRO-ELECTRIC POWER Co.,
J. W. WORTHINGTON, *President*.

Congress having provided funds for a further survey of the situation, the reports of such survey were transmitted to the House in Document No. 1262, Sixty-fourth Congress, first session, being a letter from the Secretary of War to the Speaker, as follows:

[House Document No. 1262, Sixty-fourth Congress, first session.]

TENNESSEE RIVER BETWEEN BROWNS ISLAND AND FLORENCE, ALA.

WAR DEPARTMENT,
Washington, June 28, 1916.

The SPEAKER OF THE HOUSE OF REPRESENTATIVES.

SIR: I have the honor to transmit herewith a letter from the Chief of Engineers, United States Army, dated 26th instant, together with copies of reports from Maj. H. Burgess, Corps of Engineers, dated April 5, 1915, and March 22, 1916, with maps, on preliminary examination and survey, respectively, of Tennessee River, between Browns Island and the railroad bridge below the city of Florence, Ala., made by him in compliance with the provisions of the river and harbor act approved March 4, 1915.

Very respectfully,

NEWTON D. BAKER, *Secretary of War*.

WAR DEPARTMENT,
"OFFICE OF THE CHIEF OF ENGINEERS,
Washington, June 26, 1916.

"From: The Chief of Engineers, United States Army.

"To: The Secretary of War.

"Subject: Preliminary examination and survey of Tennessee River between Browns Island and the city of Florence, Ala.

"1. There are submitted herewith, for transmission to Congress, reports dated April 5, 1915, and March 22, 1916, with maps, by Maj. H. Burgess, Corps of Engineers, on preliminary examination and survey, respectively, authorized by the river and harbor act approved March 4, 1915, of 'Tennessee River between Browns Island and the railroad bridge below the city of Florence.'

"2. The part of the river covered by these reports is generally known as the Muscle Shoals section. The improvement of this section by the United States in cooperation with water-power interests has been under consideration for some years; and an exhaustive report, published as Committee Document No. 20, Sixty-third Congress, second session, contains favorable recommendations for such an improvement at an estimated cost of \$18,701,000, of which approximately \$8,575,000 was considered as representing the value of the improvement to navigation, the remainder being chargeable to power development and to be reimbursed to the United States. The information then available was considered sufficient for a general estimate of cost and a determination of the advisability of the United States adopting the project, but was not sufficient for the final selection of sites and the making of detailed estimates of cost.

"As a result of the present survey, the district officer suggests a few minor changes in the plans, the most important being the selection of a new site for Lock and Dam No. 2. The estimate of cost is increased from \$18,701 to \$19,000,000. He also submits an alternative plan which would permit the development of about 82 per cent of the power that would be available under the first proposition. This plan is estimated to cost \$16,000,000, but is not favored by the district officer if flowage rights for the original plan can be secured at a reasonable cost. His recommendations are as follows:

"1. That provision be made by Congress for the improvement of the Muscle Shoals section of the Tennessee River for the combined purpose of providing suitable navigation facilities and for the development of power in cooperation with the Muscle Shoals Hydro-Electric Power Co.; (2) that a cash appropriation of \$5,000,000 be made, and that the Secretary of War be authorized to contract obligations for such material and work as may be necessary to com-

plete the proposed improvement, to be paid for as appropriations may from time to time be made by law, not to exceed in the aggregate \$11,000,000, exclusive of the initial appropriation of \$5,000,000; (3) that the Secretary of War be authorized to adopt either the plan of improvement first described or that designated as the alternative plan, depending upon whether satisfactory terms can be reached with the riparian owners in Basin No. 3; (4) that the Secretary of War be authorized to enter into a contract with the Muscle Shoals Hydro-Electric Power Co. for cooperation in the proposed work of improvement and for a lease of the power developable at the proposed power houses, under terms proposed by the company in its offer of December 11, 1913, or under such modified terms as may be agreed upon which are equivalent in value to the United States or which may be made necessary by reason of the selection of the alternative plan; (5) that the Secretary of War be authorized to enter into a contract with the Muscle Shoals Hydro-Electric Power Co., under such terms, as may be agreed upon, or to do the work by the hired-labor method; and (6) that the Secretary of War be authorized to retain in the service until the completion of the work all satisfactory employees who may be appointed because of lack of civil-service eligibles at the time of employment, without regard to the subsequent establishment of a register of eligibles.

"The division engineer concurs in the opinions and recommendations of the district officer.

"3. These reports have been referred, as required by law, to the Board of Engineers for Rivers and Harbors, and attention is invited to its report herewith, dated May 24, 1916. The board states that while the results of the detailed survey and the further study based thereon suggest some minor modifications in the project already before Congress, the report is in all essentials corroborative of the earlier one and presents nothing to change the opinion expressed therein that it is advisable for the United States to take this opportunity of entering into an arrangement with the Muscle Shoals Hydroelectric Power Co. whereby this serious obstruction to navigation on the Tennessee River will be overcome and at the same time one of the greatest natural resources of the country will be conserved. The board invites attention, however, to the provisions contained in section 124 of the act to increase the efficiency of the Military Establishment of the United States approved June 3, 1916, respecting the establishment of nitrate plants to supply Government needs in the manufacture of explosives for military uses, and in view of this legislation it recommends that action on the proposed contract with the Muscle Shoals Hydroelectric Power Co. be suspended until it has been determined whether the Muscle Shoals power will be utilized for such a nitrate plant. If this question is decided in the negative, the board is of opinion that the proposed improvement for combined navigation and the power purposes is advisable substantially as proposed by the district officer.

"4. After due consideration of the above-mentioned reports, I concur in the view of the Board of Engineers for Rivers and Harbors, and therefore recommend that action on the proposed contract with the Muscle Shoals Hydroelectric Power Co. be suspended until it has been determined whether the Muscle Shoals power will be utilized for a nitrate plant. If this question be decided in the negative, and the improvement by the United States of "Tennessee River between Browns Island and the railroad bridge below the city of Florence," is deemed advisable in cooperation with the Muscle Shoals Hydroelectric Power Co. at a total estimated cost of \$19,000,000, substantially in accordance with the recommendations of the district officer as given above, and in this case it is recommended that the first appropriation be \$5,000,000 and that continuing contract be authorized covering the balance necessary to complete the project.

"W. M. BLACK,

"Chief of Engineers, United States Army."

The subject was again reviewed at great length by the district engineer and the Board of Engineers for Rivers and Harbors and the cooperative plan recommended in document 20 reaffirmed, the following quotation being from the letter of Maj. H. Burgess, the district officer, to the Chief of Engineers, of April 5, 1915 (p. 11):

"15. The question of the development and utilization of water power in connection with this improvement is its essential feature, and since this has already been fully treated by the board's report of February 23, 1914, it would seem unnecessary to discuss the matter further. It will suffice to state here that the radical improvement of this section of the river appears to rest on the economical

practicability of cooperation between the power interests and the navigation interests."

The report on the preliminary examination of the Tennessee River, made by Major Burgess, was forwarded to the Chief of Engineers, by Col. (now General) Lansing H. Beach, the division engineer, with his indorsement, dated April 17, 1916, "concurring in the opinions and recommendations of the district officer," which in part are as follows:

"Excerpts from report on preliminary examination of Tennessee River, between Browns Island and Florence, Ala., dated April 5, 1915, from Maj. H. Burgess, Corps of Engineers, district engineer's office, Chattanooga district, to the Chief of Engineers, United States Army, forwarded, concurring in the opinion and recommendations of the district engineer, by Lansing H. Beach, colonel, Corps of Engineers, division engineer (pp. 40-41, 43):

"82. The benefits to result, then, from combining the Muscle Shoals power development with the storage plants on the Tallapoosa and Little River systems is the increase of primary power from 100,000 to 280,000 horsepower, and of 10 months' secondary power from 115,000 to 210,000 horsepower; and of being able to use the potential energy at Muscle Shoals, a total of about 3,330,000,000 horsepower hours per year, as against a probable utilization of only about 2,020,000,000 horsepower hours per year for the independent plants (assuming that 9 months' secondary power is developed).

"83. The importance of the combination of power plants may possibly be emphasized by showing the annual expenditure of coal required for producing an equivalent amount of electrical energy. The latest and most efficient type of steam-power plants show a consumption of coal of approximately 1½ pounds per horsepower hour. It may be assumed that improvements will reduce this to 1 pound per horsepower hour. On this assumption, the annual output of electrical energy for the independent development of Muscle Shoals is equivalent to the consumption of 1,010,000 tons of coal per year, and the annual amount of potential power at Muscle Shoals utilized under the combination of power plants is equivalent to an annual consumption of 1,665,000 tons of coal per year. The waste of the coal supply of the United States resulting from the failure to utilize to the greatest practicable extent the potential water power at Muscle Shoals would, therefore, be approximately 650,000 tons per year.

"84. It does not seem reasonable that such great benefits should be lost for the fear of possible evils to result from large power combinations. There is no doubt that either the United States Government or the State government should control such combinations of power for the purpose of regulating rates to consumers; but combinations that produce enormous saving of energy, which otherwise would be wasted, ought to be encouraged rather than forbidden. True conservation requires the utilization without waste of all natural resources, and here at Muscle Shoals there will be enormous wastage if this run-of-the-river power can not be combined with plants having facilities for storing great quantities of water to make up for the shortage at Muscle Shoals during times of low water.

"85. Another great benefit from the combination of power plants which is sometimes lost sight of is the elimination of duplications of expensive transmission lines, transformers, and other equipment necessary for distribution of power. Since interest must needs be paid by some one on the extra capital invested in the duplication of equipment, it follows that the actual cost of placing power on the switchboard of the consumer is greater for separate developments than for combined plants. It is true that competition may result in the consumer paying less for power under the supposition of separate developments than in the case of combinations, and it is for this reason that it is desirable to so regulate rates of power combinations that most of the benefit of cheap production of power shall revert to the consumer rather than to the stockholder of the power company.

"93. It is not true conservation of natural sources which forbids their development on the plea that the State or General Government is not obtaining full value for the grant of privileges. There is little doubt that franchises for power developments should be for limited periods, so that the people may again take over their property and provide for its future operation under conditions suitable to the time when the limited franchise has ended. It is equally certain that the interests of the people demand a regulation of rates to the consumer, so that the company which has been granted the franchise for operat-

ing a property belonging to the people may not obtain an undue profit at the expense of the owners. Assuming such regulation, it is unimportant whether or not any payment is required to be made to the State or General Government, or what the size of such payment shall be. In any event, under the assumed regulation of rates, whatever amount is charged to the power company is paid by the consumer, and the collection of such amount is merely an exercise of the taxing power of the Government. It seems reasonable, therefore, that the present plan, which contemplates the navigation improvement of this section of the river and a more complete utilization of the potential power than seems practical by any other combination of plants, and which can be secured under fair and reasonable terms, ought to be adopted, rather than to have this power continue to be wasted for many years and to have through navigation remain unobstructed by these shoals, on the ground that delay may result in securing somewhat better terms from some other power company proposing to cooperate.'"

Mr. MARTIN. The President selected these Wilson Dam sites, and thereupon, on February 18, 1918, the Alabama Power Co., which was the owner, through the Muscle Shoals Co., of the Wilson Dam site, addressed the following to Col. C. Keller, of the Corps of Engineers, in which it agreed to donate the Wilson Dam site to the Government for development in connection with the nitrate problem:

ALABAMA POWER CO.,
Birmingham, Ala., February 18, 1918.

Col. C. KELLER,
Corps of Engineers, United States Army, Washington, D. C.

SIR: Following the several interviews which I have had with you recently on the subject of the desire of the Government to acquire from the Muscle Shoals Hydroelectric Power Co. the dam site and certain other properties at Muscle Shoals, I have conferred fully not only with the directors of that company but also with the representatives of the security holders of the Alabama Traction, Light & Power Co. (Ltd.). As I believe I explained to you the last-mentioned company is interested by reason of its stock holdings in Alabama Power Co., which latter company owns the stock of the Muscle Shoals Hydroelectric Power Co.

The properties in question represent a very heavy investment by our company and have occupied an important position in our plans for securing power for the future. For several years we have worked on plans for ultimately developing these water powers as an integral part of the hydroelectric system which will be required by our companies to meet the needs of the communities which they serve. Much of this work was done by us in collaboration with the Army engineers looking toward a development in cooperation with the Government on some such plan as was favorably reported on by the Army engineers in House Document No. 1262, Sixty-fourth Congress, first session.

I am adverting very briefly to these features as I judge from the several interviews which I have had with you and with other representatives of the Government that you are fully aware of what the company has done in preparation for the ultimate development of this waterpower, and I believe you appreciate that it should receive consideration in the disposition of any surplus power not required for the needs of the Government.

From our recent interviews it is obvious that our respective views as to the value of our property and the price which you would agree to pay are quite irreconcilable. As directors of a large public-service corporation we have always believed that in addition to the development of our waterpowers at Muscle Shoals being a very valuable and necessary complement to our system throughout the State, the large industrial community which would grow up at Muscle Shoals would add a special value to that power plant. In times like these, however, such considerations must be secondary to the urgent need of the Nation to secure these properties immediately for the carrying out of the Government project for the production of war nitrates, and we have accordingly determined to donate our lands to the Government for this purpose. I have already given instructions to the company's attorneys for the preparation of the necessary deeds of conveyance.

It is our understanding from you that the Government only desires to acquire the site at Dam No. 2 and adjacent properties, with flowage easement on such of our other properties as may be affected by this development.

I need hardly assure you of the desire of the company to cooperate with the War Department to the fullest extent in placing at your disposition the benefit of all our engineering studies and records relating to the projected development.

I trust that this disposition of the matter meets with your views.

Yours very truly,

JAMES MITCHELL, *President.*

That letter was acknowledged by the Secretary of War, Mr. Baker, on February 20, 1918, as follows:

WAR DEPARTMENT,
Washington, February 20, 1918.

Mr. JAMES MITCHELL,
President Alabama Power Co., Birmingham, Ala.

DEAR SIR: Referring to your letter of the 18th instant, addressed to Colonel Keller, in which you express the willingness of your company to donate to the United States certain properties and flowage easements needed for the proposed Federal power development at Muscle Shoals, I beg to acknowledge with thanks the company's generous and public-spirited action.

The further steps necessary in regard to the matter will be given immediate attention.

Very respectfully,

NEWTON D. BAKER,
Secretary of War.

That site is now the Wilson Dam site, and while we received from the Government its check for \$1, we had expended in our various efforts to make the development slightly less than \$500,000.

The CHAIRMAN. You mean that you gave to the Government for \$1 property that cost you \$500,000?

Mr. MARTIN. Yes, sir. We were in negotiation with Colonel Keller and other officers of the Army with respect to the terms of the donation, terms of the conveyance to the Government. We were unable to agree promptly upon terms. The War Department was desirous of going forward with this development in connection with the war program, and that was the basis on which the negotiations were proceeding. We were asked not to delay the war program, but to aid it. We did it. We agreed to aid the war program, and waive the question of compensation, and we conveyed it to the United States without any compensation outside of the \$1.

The CHAIRMAN. And without any agreement that it should be taken up afterwards?

Mr. MARTIN. Yes, sir; there was no agreement about it.

Following the conveyance to the Government, under date of April—

The CHAIRMAN (Interposing). I wish you would, in a general way, not directly, but in a general way, outline now what this property consisted of that you donated to the Government.

Mr. MARTIN. The lands at either abutment site which you saw, and certain overflowed lands.

The CHAIRMAN. About how much was there of that?

Mr. MARTIN. I can not give you the acreage right now.

The CHAIRMAN. You say you had expended \$500,000. Was that in acquiring this property?

Mr. MARTIN. Not only of the acquired lands, but we had spent a good deal of money in engineering and investigation, borings, plans, and general overhead charges.

The CHAIRMAN. Did your company make the borings at Dam No. 2?

Mr. MARTIN. Some of them. The Government made most of them.

The CHAIRMAN. Did the Government utilize or rely on the borings that you had made?

Mr. MARTIN. Well, yes. We turned over to the Government all our plans, investigations, and everything we had done.

The CHAIRMAN. What I am trying to get at, Mr. Martin, is just what the value of the property was to the Government that it acquired of you for this \$1.

Mr. MARTIN. Well, it is a difficult matter to get at the value.

The CHAIRMAN. Yes; it would be to get it definitely, but I would like to get it in round numbers, as near as I can.

Mr. MARTIN. I could only say this: This Muscle Shoals Hydro-Electric Power Co. was formed by citizens of Alabama in 1906. They worked in an effort to develop the property until they sold it out in 1912, and the purchasers continued in their efforts to develop it, putting more money into lands, investigations, general expenses, salaries of men and officers, in connection with the whole subject, until at the time of the donation in 1918 there was charged against this development slightly less than \$500,000 as the cost from 1906 to date.

The CHAIRMAN. Do you know how many acres of land was conveyed to the Government?

Mr. MARTIN. I do not know. The question of acreage of land is not so important, because, the property the company owned was the abutment sites.

The CHAIRMAN. I understood when we were there that you owned the abutment sites. That is the land on each side of the river where the dam is located. How much land did you own there?

Mr. MARTIN. Several hundred acres. I don't recall, Senator, now, without looking it up.

The CHAIRMAN. For instance, on the south side, where the buildings are and where the railroad track was built, you owned all that land, did you?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. Did your company make any of the improvements back on the river where they had borings to ascertain the condition of the rock?

Mr. MARTIN. We made no improvements, Senator; no construction in the way of buildings.

The CHAIRMAN. In the work there back from the river quite a ways, some places there are borings made. It seems that at the abutments crevices were discovered in the rock, some of them quite large, that you could plainly see, that a man can walk in, big holes in the rock. That work had not been done by your company, had it?

Mr. MARTIN. No, sir.

The CHAIRMAN. It was necessary to fill those all up, to go far enough in until you got solid rock?

Mr. MARTIN. Yes, sir. You will find on investigation of the plans and specifications under which this work began that we turned over to the Government, that they bear the signature and approval of the chief engineer of our company, and many of which the Government made use of, and many of which were changed. We had worked out very definite plans, and in negotiation with the Government engineers they were all presented to the Government. While changed oftentimes, many of them were accepted as the basis on which development would go ahead.

Senator HEFLIN. Mr. Martin, at the time you conveyed this property to the Government, did you not have it specified in the contract that if the Government at any time decided to get rid of it, it would give you an opportunity to get it back?

Mr. MARTIN. No, Senator. We discussed the matter fully with Senators Bankhead and Underwood and with the Government engineers and it was understood and discussed that we naturally would want to negotiate if the Government should want to put the power in commercial use. The form and terms of the deed were also fully discussed, but our future connection with the situation was left in the form of mere discussion.

Senator HEFLIN. I may have it confused with some of the other property.

The CHAIRMAN. You may have it confused, Senator, with the Gorgas plant. There there was such a plan put in writing.

Senator HEFLIN. That was the Gorgas plant and not the Wilson Dam?

Mr. MARTIN. Yes, sir.

Senator HEFLIN. Well, that is it. I had it confused.

Senator KENDRICK. Do you recall, Mr. Martin, whether you transferred to the Government absolute title to all the lands in the neighborhood of the abutments of the dam, the ends of it?

Mr. MARTIN. Yes, sir; in connection with Dam No. 2 we did. We went over the subject fully and elaborately and prepared deeds, and that was under discussion for some time as to just exactly the terminology of the deed. It was over a year before we got the formal deed satisfactory to the Government. and—

Senator KENDRICK. And without reservation?

Mr. MARTIN. Without reservation. Of course we have the Dam No. 3 site.

Senator KENDRICK. That is 35 miles up the river?

Mr. MARTIN. Yes, sir; and we have some other properties in those communities which do not constitute a part of the No. 3 development. Wherever there was any property needed for development purposes we conveyed it.

Senator KENDRICK. At Dam No. 3, according to a map shown us while we were there on the bank of the river, it has been thoroughly drilled, apparently clear across the river, and as I remember, two rows of drill holes. Did the Government do that drilling or did you do it?

Mr. MARTIN. The Government did all of it under the \$150,000 appropriation in 1915.

The CHAIRMAN. That is about the extent to which the Government has gone, as far as Dam No. 3 is concerned, is it not?

Mr. MARTIN. Yes; except plans have been made.

The CHAIRMAN. Plans, I presume, have been made. Borings have been completed clear across the river?

Mr. MARTIN. Yes, sir; the plans which were made in cooperation with our company in 1915 and 1916 are the plans that we understand are the present plans for that development.

Now, there is one other letter that I would like to call attention to, and that is our letter to the Chief of Engineers in reply to the letter which the Chief of Engineers wrote us under date of April 2, 1921. He wrote us, as he wrote to many others, to know what arrangements could be made to derive a reasonable return upon the investment if the United States completed the dam and hydroelectric power plant at Muscle Shoals.

We replied to the letter of the Chief of Engineers under date of May 28, 1921, which reply I would like to file in the record, in which we reviewed our connection with this project and stated that we regarded the undertaking as economical and profitable under the conditions under which we made our former proposal, and stated that we were prepared to go forward and work out a plan of cooperation with the Government if it was desired to place a part of this power in commercial use. We did not in that letter fix any definite basis on which we would proceed, but we left it in general terms.

(The letters referred to are as follows:)

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, April 2, 1921.

ALABAMA POWER Co.,
Birmingham, Ala.

GENTLEMEN: 1. The Secretary of War has directed me to ascertain what arrangements can be made to derive a reasonable return upon the investment if the United States completes the dam and hydraulic power plant at Muscle Shoals, Tennessee River.

2. If you are interested, I would be pleased to discuss the matter with you at this office at the earliest date that may be mutually determined.

3. It is desired to develop the matter and come to a conclusion at as early a date as possible.

Very truly yours,

LANSING H. BEACH,
Major General, Chief of Engineers.

ALABAMA POWER Co.,
Birmingham, Ala., May 28, 1921.

Maj. Gen. LANSING H. BEACH,
Chief of Engineers, Washington, D. C.

DEAR SIR: We duly received your communication of April 2, 1921, inquiring what arrangements can be made to derive a reasonable return upon the investment if the Government completes the dam and hydraulic power plant at Muscle Shoals, Tennessee River, and you invite a discussion of the matter if we are interested.

We have given the subject of your letter careful consideration since its receipt and wish to make a reply as follows:

1. The site at which the dam is being constructed on the Tennessee River was purchased by our company in 1906, and from that time until 1918, a period of 12 years, we expended large sums of money in making studies, exploring foundations, and in the purchase of reservoir lands, with the view of its development as an integral part of the hydroelectric system which would be required to meet the needs of the communities which the company proposed

to serve from time to time. It was our plan to construct storage reservoirs and to connect them with the proposed Muscle Shoals development to make up the deficiency in power at the latter place during seasons of low water. This fact alone would have enabled this company to plan for an ultimate installation at Muscle Shoals largely in excess of the installation that should be made as an independent, separate development. In short, our plans were adapted to fully conserve and utilize in the public interest the navigation and water resources of the region.

2. In the meanwhile we acquired other power sites in Alabama, and under an act of Congress of 1907 constructed a dam and power plant on the Coosa River, a smaller hydro plant on a nonnavigable stream, and several steam plants at different points on our system, with a total capacity of 177,400 horsepower (not including the Government steam plant at Warrior). This system embraces about 1,500 miles of high-tension lines, over which we are distributing energy to the public in more than two-thirds of Alabama, including one of the greatest industrial and mining districts in the country.

3. During the same period the engineers of the United States were investigating the project pursuant to the direction of Congress. A special board of engineers was created for the purpose of obtaining information and estimates relative to the coordination of proposed improvements for navigation and water power, and that board invited bids for cooperation by water power interests in the proposed development. This company, through its subsidiary, Muscle Shoals Hydroelectric Power Co., submitted a plan in response to that invitation of the United States Engineers. Plans were also submitted by others, but upon careful investigation the special board recommended that Congress undertake the improvement in cooperation with this company, and that recommendation was concurred in by the Board of Engineers for Rivers and Harbors and by the Chief of Engineers. Believing that this was an economical and profitable undertaking, we were prepared under the conditions then existing to proceed with our share of this undertaking and if this recommendation had been favorably acted upon, the project would have been available for the manufacture of nitrates during the war period, and many millions of dollars would have been saved.

4. A further examination and survey of the project was made by the engineers of the United States in compliance with the provisions of the river and harbor act, approved March 4, 1915. Recommendation was again made that the improvements be undertaken in cooperation with this company, but the engineers further recommended that action be suspended until it should be determined whether the Muscle Shoals power would be utilized for a nitrate plant under the act of Congress of June 3, 1916. (Doc. No. 1262, 64th Cong., 1st sess., 1916.)

5. We are adverting to these matters in order that you may see that we were for a number of years interested in working out a feasible plan for the development of the Muscle Shoals power for general industrial use on lines of coordination with improvements for navigation. However, in 1918-19, this particular site was selected for development by the United States to supply power for a nitrate plant; and as it seemed that the United States needed to go forward quickly in its war program to make provision for nitrates, we concluded as the result of various conferences with representatives of the Government to donate to the United States the dam site and other lands owned in fee by this company, leaving entirely to the Government the question of any plan for future cooperation with the United States. This donation was made and we received from the United States its voucher for the sum of \$1, being the nominal consideration expressed in the deed. As you may recall, the donation was accepted in behalf of the United States by the Secretary of War, under date of February 20, 1918, who expressed the thanks of the Government for the company's action in so donating the property. The property thus donated represented on our books a total investment by this company, to the time of the donation, of approximately \$476,000, but we desired to be helpful to the Government in its war program and made the donation in that spirit. From that time until the receipt of your letter, we have taken no action with regard to the Muscle Shoals project other than the interest common to every patriotic citizen to encourage the progress and development of the Tennessee River Valley and the contiguous country.

6. We do not wish to suggest a course contrary to the expressed purpose of Congress that all of the Muscle Shoals power shall be used in the manufacture of nitrates or other products needed for munitions of war and useful in the

manufacture of fertilizer and other useful products. Practically all of the electrical power used in industrial and mining operations in Alabama is furnished by this company, in addition to which we supply the lighting and other municipal requirements in more than two-thirds of the State; and if, in the wisdom of Congress all of the power at Muscle Shoals should be reserved for nitrate purposes, or applied to any other use considered to be of greater benefit than the public service rendered by this company, we will continue our program to develop other water powers as the public may require.

7. We therefore wish to mention the following difficulties in the way of making any suggestion at this time which will be of substantial assistance to the Government in dealing with its problem at Muscle Shoals:

(a) Section 124 of the national defense act, of June 3, 1916, under which the Muscle Shoals dam and power plant are being constructed, contains the following clause:

" * * * The plant or plants provided for under this act shall be constructed and operated solely by the Government, and not in conjunction with any other industry or enterprise carried on by private capital * * * "

This, of course, presents a serious legal question as to the authority of the Secretary of War, the Federal Power Commission or other agencies of the Government to deal with the project without further legislation by Congress. In addition, funds must be provided and the delay and uncertainty of action by Congress is a very serious element in any proposal.

(b) This company is not advised as to the extent to which the Government is disposed to consider a portion of the investment as being due to war emergency; or what portion may properly represent its power supply for nitrate purposes, in addition to which it is assumed that a portion will be charged to the improvement of navigation of the Tennessee River. These are vital considerations, inasmuch as excessive costs would burden the entire future of the power development, increase the cost of power to consumers and tend to discourage industrial enterprises which, with low power costs, should supply a market for a part of the Muscle Shoals power.

(c) This and other power companies engaged in public service are in duty bound promptly to find and develop sources of power at the lowest practicable cost to supply the rapidly increasing demands of the communities served. These demands are at this very moment most insistent. To fulfill its immediate requirements this company has applied to the Federal Power Commission for a license and is about to construct an important additional hydroelectric development on the Coosa River. While it is true that the power thus secured will be completely absorbed and new sources required by the time the Muscle Shoals dam could be completed, yet the difficulties above mentioned and the doubt which arises from the apparent reluctance of Congress to sanction an arrangement of cooperation, as shown by the clause of the act of 1916 above quoted, suggest that this company would scarcely be justified in depending upon Muscle Shoals to take care of even more remote demands which are certain to arise and which must be prepared for well in advance.

8. If the above difficulties and uncertainties can in any manner be cleared up and excessive costs avoided by fair charges to war emergency, power for nitrate purposes, and improved navigation, this company is of the opinion that the development can go forward and be completed with the view of the sale and distribution of a sufficient volume of power therefrom by this company and other companies engaged in public service in the territory adjacent to this development to enable the United States to derive a reasonable return upon such part of the investment as may be properly allocated to the power feature of the project.

9. Our company, together with adjacent power companies, possesses the necessary organization for the distribution of the power to the public; and while the principal markets in the South are now served by those companies, their transmission systems would have to be supplemented by new lines and other equipment to market this power. The power systems in the southeastern States are now interconnected, and the advantage to the public of such interconnection was the subject of a careful survey by eminent engineers acting under your direction, and the subject is thoroughly discussed in a report prepared in the office of the Chief of Engineers by Col. Charles Keller and now printed as an official document, entitled "The Power Situation During the War."

We are inclosing with this letter further excerpts from that report which discuss at length the Muscle Shoals development.

10. It will require much consideration and study to enable us to present any definite commitment, and would, furthermore, require a more definite statement as to when the power would be available and as to just what portion of the cost would be accepted as the investment in the power project, these being elements which you will appreciate are vital in determining a course in the matter so far as our ability is concerned to take the power at a price affording the United States a reasonable return.

We may add, however, that during our connection with the project, as shown by our formal proposals in response to the Government's invitation (Docs. Nos. 20 and 1262), we regarded the construction of a power dam (at reasonable costs and on commercial plans) at this locality as both a practicable and profitable undertaking; and if there is a possibility that the Government will wish to have any part of the power used in a practical way for commercial purposes, then we would like to urge now that some disposition of the matter be made as early as possible, as you can appreciate that in its present status it is a disturbing feature in the industrial situation in this section.

If, therefore, authority is conferred by Congress to conclude a contract for the use of any part of the power by power companies, we wish to assure you that we are ready to work out a mutually satisfactory arrangement looking to the completion of the dam and the disposal of such part of the power as Congress wishes to place in commercial use, desiring now, as at all times in the past, to cooperate in every way desired by the United States in working out the matter.

Yours very truly,

ALABAMA POWER CO.,
By THOS. W. MARTIN, *President*.

APPENDIX.

EXCERPTS FROM THE REPORT PREPARED IN THE OFFICE OF THE CHIEF OF ENGINEERS ENTITLED "THE POWER SITUATION DURING THE WAR."

The following is from Appendix E, entitled "Electric-Power Problems in the Southern States," pages 237-238 of that report:

"The great advantages of the interconnection and joint operation of power systems, and the economies in the building for increase in generating capacity, as herein stated, apply equally to a combination of the privately owned power companies with the Government powers now building at Muscle Shoals. The characteristics of this Government power and the gain, both to the Government and to the privately owned powers, that would result from interconnection and exchange of facilities was an important consideration in the recommendation of the Tallapoosa River project, inasmuch as the interstate combination, with other power substituted for Tallapoosa, might be quite as favorable as the Tallapoosa powers in a combination without Muscle Shoals.

"21. Under the present laws, the Government Muscle Shoals hydropower now building can not be connected to or operated in conjunction with private interests. * * *

"25. The proposed interstate-power system above described, including the proposed Tallapoosa River developments, and capable, as stated, of producing 2,100,000,000 kilowatt hours of prime power annually, if combined and operated in conjunction with a hydro plant at Muscle Shoals with 300,000 kilowatts ultimate installed capacity as proposed, would be capable of producing, in years of normal river flow, 2,800,000,000 kilowatt hours annually of prime hydropower without any steam generation."

The following is also from Appendix E, entitled "Electric-power Problems in the Southern States," pages 264 to 267, inclusive, of the report entitled "The Power Situation During the War":

"140. The proposed hydro development at Muscle Shoals authorized by the Government and now being built under the direction of the Chief of Engineers, United States Army, provides for a high dam in the Tennessee River and the installation of electric machinery for the generation of power. The river flow and other natural conditions at the site selected will permit the generation of 60,000 kilowatts during stages of low water in an extreme low year, and 300,000 kilowatts can be generated during five months in years of normal river flow.

"141. By act of Congress (39 Stat. 215) it is provided that 'the plant or plants provided for under this act shall be constructed and operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital.' The terms of the act are such that it would be unlawful

to interconnect this plant with central-station power systems of the Southern States and use even a portion of this power for other than Government industries.

"142. This report on the power resources of the Southern States has been prepared to point out the most economic and reliable source of power that can be utilized for serving the industries of the South with a view to securing maximum economy in generation, and the resources in water and steam power thus far considered have excluded the Muscle Shoals project by reason of the existing law prohibiting the use of this power for private purposes.

"143. The procedure is illogical and unreasonable, because in order to provide cheap power it is necessary that the best sources of power be used, whether they are hydroelectric developments using the natural flow of the rivers, or whether they are hydroelectric powers with storage reservoirs that conserve the water during high-water stages for use during low-water stages, or whether they are sources of steam power, and further it is necessary to operate these powers jointly to obtain maximum economy, reliability, and conservation of resources in fuel, labor, and materials.

"144. The best economy and reliability can not be secured by any one development, whether it is hydro power by flow of stream or by storage or steam power, but will be obtained by a suitable combination of these different sources and by the interconnection of the systems supplied by them. Muscle Shoals has been selected by the Government as a favorable location for the production of cheap power. The proposed design will furnish 100,000 kilowatts of prime power and 200,000 kilowatts of second-class power in an average year. The steam plant of 60,000 kilowatts which the Government has installed at Muscle Shoals is capable of converting a portion of the second-class power to prime power. But this combination with a steam plant at Muscle Shoals, regardless of whatever economy may result, can not be, broadly speaking, as favorable for all interests, either the Government interests or private interests, as a combination of the group of public-utility systems as described in this report. To segregate the Muscle Shoals power facilities from the other systems of the country is contrary to the policy recommended and strongly advocated; that is, of interconnecting all of the efficient going power systems and jointly operating them for maximum economy. The same principle which works for increased economy by interconnecting the public-utility power systems of the Southern States applies to a further interconnection including the Muscle Shoals plants, and in the interest of cheap and reliable power the law should be changed and the interconnection and joint operation of all of the development power should be provided for.

"145. It is important that the law should be modified and the plants perfected at an early date for the joint operation of all southern electric utilities and the Muscle Shoals power, since the recommended future construction for development of power facilities for the Southern States must depend, in a large measure, on whether or not Muscle Shoals will be available for other than Government work. For instance, if Muscle Shoals power is to constitute an important source of the generating capacity of an interconnected system for the Southern States, the logical procedure for other developments by the public-utility companies will be to build hydro plants with large storage reservoirs and steam plants, both of which will work economically in conjunction with the second-class power of Muscle Shoals, instead of developing additional flow of stream hydro power, which they might otherwise do if Muscle Shoals will not eventually be available in a few years, their own resources will not be of a nature to advantageously supplement Muscle Shoals and turn its second-class power into prime power should the Government policy be later changed. Even if a Government demand is built up for the entire use of Muscle Shoals, the Government would be handicapped in having a large amount of second-class power, which is not as valuable as prime power, and for which it would not have the most effective source of conversion of second class to prime power.

"146. It is especially desirable that the interconnection of the combined southern power system be available for the purpose of distributing the Muscle Shoals power immediately upon its completion, and at least until its own market can be obtained, and that the developments of the next 5 to 10 years be directed toward the construction of such plants as will advantageously supplement Muscle Shoals. By this is meant that by the time Muscle Shoals is completed it is perfectly practicable for the power system of the Southern States to acquire a connected load that will absorb a large part of the Muscle Shoals output and to

have installed such plants of their own creation as will be useful to turn Muscle Shoals second-class power into prime power.

"147. It is argued that the Government steam plant can be used, when the hydro plant at Muscle Shoals is finished, to turn a large part of the second-class power into prime power. This is true; it can be used, but it is not the best plan available. There are large steam plants already built, and others will probably build before Muscle Shoals is completed, which, because of their more advantageous location for fuel, can make steam power more cheaply than the Government steam plant at Sheffield. Also, if the future load for Muscle Shoals is in a large part located at industrial centers in Alabama instead of in the Muscle Shoals-Sheffield district, the existing steam plants and prospective future steam plants will be more favorably located than the Muscle Shoals steam plant for joint operation with Muscle Shoals hydro power. This feature is important from standpoint of reliability of service and transmission cost as well as in economy of generation. In fact, if Muscle Shoals is interconnected with the other southern power systems and generally operated with them for maximum economy, the steam plants in the industrial sections of Alabama, and favorably located at the mines for cheap fuel, would be put into operation in case of low water before the Muscle Shoals steam plant would be started.

"148. If interconnection between Muscle Shoals and the big public utility power companies of the Southern States is not planned for in the near future and eventually carried out under favorable conditions, the Government development at Muscle Shoals is liable to result, not in cheapening power for the industries of the South, but rather in increasing the cost. It is a matter of common knowledge that one of the large private interests acquired the water-power site at Muscle Shoals and spent a large sum of money in preparation for a hydro development similar to the one now built by the Government, with the intention of distributing this power to the industries of Alabama, which would logically later on, through interconnections, be extended to service in Georgia and Tennessee. The Government has come into the situation and taken over this source of power and is building the plant, as provided by law, exclusively for Government use, and if this is carried out, it will result in private industries being deprived of this natural resource, which, by reason of the Government's own action in selecting this power for its use, may be regarded as a cheap source of power.

"149. We have no figures as to what the Government estimates the cost of Muscle Shoals power will be, either primary power or second-class power, since the undertaking at this place is for the joint purpose of improving navigation and for creating power, and we are not informed as to the proportionate charge that goes to these two purposes. It is, however, obvious that if a big power load is to be built up about Muscle Shoals, it must be done either by direct Government operation, or else the attraction in the way of low-priced power must be very marked to divert manufacturing from the present industrial centers and favorable locations for raw materials and transportation, to the district adjacent to Muscle Shoals, which is sparsely developed industrially. If the inducement in the way of cheap power is sufficient to overcome the natural conditions as established by the superior industrial progress in other sections, the power at Muscle Shoals must be made available at a relatively low rate, which also, without the modification of the present law, would have to be wholly for Government purposes.

"150. It therefore appears that a broad and well-founded judgment would dictate that the Muscle Shoals development should be interconnected for exchange of power with the existing power systems of the Southern States, and that this interconnection and exchange should be arranged for without delay, so that future construction, both at Muscle Shoals and elsewhere, can be directed for the production of plants which will supplement each other for economy of construction and operation."

Senator KENDRICK. It may be premature to the question at this time, but we must, as fast as possible, get to an understanding in order to reach a proper conclusion.

I want to ask in case we come to seriously or favorably look upon the proposition of the Alabama Power Co. would you be interested in a plan by which you would take the property that you ask us to transfer to you not at its cost, but its actual value, subject, of course, to all the deterioration, and then guarantee to the Government—take over the dam and complete it and guarantee to the Government the 100,000 secondary horsepower, just as you propose, at an income on the amount already invested in the dam? Would that sort of a proposition interest your company?

To make the question plain, as I understand it you have said you would give so much for this property, take over the dam and complete it, and give in lieu of the investment or as an income on the investment already made in the dam \$5,000,000, payable in installments. Now, the question in my mind is would you consider or would you be interested in a proposition under which the Government sat down with you to estimate the actual value of the property?

Mr. MARTIN. The steam-plant property, Senator?

Senator KENDRICK. The transmission line at the Gorgas plant and transfer it to you at, we will say, 80 per cent or 90 per cent of its actual value. Not the original cost, but what it would cost to replace it now.

Mr. MARTIN. We naturally would be interested in trying to solve this question. When it comes to negotiating the actual value of the plant there are various elements on which we would expect business men on both sides to differ. We, you understand, Senator, have suggested a plan by which we will undertake a very large financial obligation. That is to be considered when it comes to the question of how much we should pay for the property to the Government. All of those elements are entitled to be considered, and we are prepared to consider them, and we have felt that we have made a proposition which is fair under the conditions named. If the proposition is not acceptable, we will be prepared to negotiate.

Senator KENDRICK. As one member of the committee I just want to say, in explanation of the question, as one member of the committee I have not lost faith in the Government or the company, and I do not want to see the Government sacrifice all of this property, because I consider it absolutely unnecessary.

Mr. MARTIN. It is unnecessary.

Senator KENDRICK. If the Government went forward and completed that Wilson Dam there is not a chance in the world but that every building that it has constructed there of a permanent character would be in immediate demand for manufacturing purposes, and would bring a fair value on not the full cost, because we built them under war conditions, but certainly on the basis of their fair value.

Mr. MARTIN. There are values there that the Government can realize.

Senator KENDRICK. They have a permanent value because they are built permanently, and they are built wisely and well, and I do not believe in the whole United States there is a steam power plant like the one at the Muscle Shoals Dam.

Mr. MARTIN. It has one serious handicap, Senator; it is located over 100 miles from the coal field.

Senator KENDRICK. Yes, but we are going to overcome that with water transportation.

Mr. MARTIN. That is one of the serious questions.

Senator KENDRICK. That will eliminate a large part of that difficulty.

Mr. MARTIN. Of course in any case in a steam plant located away from the coal field it always has the handicap of freight rates, or rates, at any rate, to get coal there.

Senator KENDRICK. Yes. I want to ask you a question about that, Mr. Martin. These are questions I am asking myself in connection with the solution of this problem.

If you were locating the steam plant to-day and you had open navigation from the coal mines to that plant, would it not in your judgment form a more economical unit to operate to have the steam plant right there by your power plant, if you had cheap transportation for coal?

Mr. MARTIN. No. Senator, if we had to locate a steam plant there—

Senator KENDRICK. Does it not cost like the dickens to maintain a power line?

Mr. MARTIN. No, sir. It costs, yes, but—

Senator KENDRICK. I should think it would be much like maintaining the cost of any other kind of a transportation line.

Mr. MARTIN. You visited the situation recently, didn't you, Senator, with the committee? Didn't you go South with the committee?

Senator KENDRICK. Yes. I was along.

Mr. MARTIN. You see the advantage of the steam plant at Warrior, as that plant is right at the mouth of the mine.

Senator KENDRICK. Yes.

Mr. MARTIN. You see the great advantages there, with coal operations that can be speeded up or retarded to meet the needs of the plant, delivering coal

from the mouth of the mine to the steam plant without any transportation charges.

Senator KENDRICK. Yes; that is all true, but here is your investment in the transmission line. That is the first thing. Your maintenance of the transmission line. Then your increased lost motion and cost of administration because your business is scattered.

Mr. MARTIN. If you are going to locate large steam plants to serve any large area it is better to put them in the coal fields rather than to depend upon transporting coal by freight.

Senator KENDRICK. That is a question I wanted to develop.

The CHAIRMAN. Mr. Martin, this is a question that I also asked Colonel Barden. Maybe you know. If you do I wish you would tell us. Why did the Government build the steam plant right there by nitrate plant No. 2 instead of building it over there at Warrior River or some other place at the mouth of a coal mine? There are coal mines everywhere along there. You could build one any place.

Mr. MARTIN. Of course, I should qualify my statement to you, Senator. The problem of the war was the one that settled the location of the steam plant at Sheffield, because at that time it was deemed wise to have a source of power immediately under the control of that plant rather than at the end of a transmission line. That was the reason that caused it to be located at Sheffield, as I understand. Aside from that, it was not located on a commercial basis.

The CHAIRMAN. Exactly; but the primary object of the whole thing there when we began was as a war proposition entirely.

Mr. MARTIN. Yes, sir.

The CHAIRMAN. And I suppose if the Government retains it it will be with that idea in the future, that we may have another war. The idea is that in case of war we should have a plant that is best suited for all conditions?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. While it would be a little more expensive, the power plant located 100 miles away from the machinery would necessitate the guarding of a transmission line in time of war.

Mr. MARTIN. That was the theory.

The CHAIRMAN. And the whole thing could be put out of business by some man cutting the wire, could it not?

Mr. MARTIN. Yes. Of course, we did not have any trouble. We operated the line seven months during the war.

The CHAIRMAN. Yes; that is true.

Mr. MARTIN. But that led to the location, principally, of the plant where it was located.

Senator KENDRICK. I have a question, Mr. Martin, that I wanted to ask. Have you any idea as to the approximate distance between the power plant and the nearest dependable supply of coal?

Mr. MARTIN. The Muscle Shoals steam power plant?

Senator KENDRICK. Yes. We have heard a good deal about coal mines in every direction there, and my idea was to ascertain how near coal is that can be reached by water transportation.

Mr. MARTIN. The nearest coal is in the Warrior coal fields, in the locality of Cordova, where you took the boat going down the river.

The CHAIRMAN. That coal can not be transported to Muscle Shoals except by railroad?

Mr. MARTIN. By railroad.

The CHAIRMAN. The Senator's question is where is the nearest coal on the Tennessee River?

Mr. MARTIN. I can not answer.

The CHAIRMAN. Is not that your question?

Senator KENDRICK. Yes; or by water; whether it be on the Tennessee or a tributary of the Tennessee.

The CHAIRMAN. By water means the Tennessee River.

Senator KENDRICK. Yes.

The CHAIRMAN. In other words, how far is it from Muscle Shoals to the coal fields?

Mr. MARTIN. I can not answer that question. While we were operating the steam plant there we were getting the coal in that district in the neighborhood of Cordova.

Senator KENDRICK. That would have a bearing on the cost of fuel, whether you could secure water navigation?

Mr. MARTIN. Undoubtedly water transportation will have a serious effect upon the value of that plant.

I want to mention one other question. The whole matter of this Muscle Shoals received a still further review by Government engineers at the conclusion of the war in a volume entitled "The Power Situation During the War," which was prepared by Gen. Charles Keller, Corps of Engineers, and published by authority of the Secretary of War in 1920, excerpts of which I would like to hand to the reporter for the record.

In the course of that report it was again recommended by the engineers that this Muscle Shoals development should be interconnected with the other power systems of the South. The concluding paragraph reads as follows:

"It therefore appears that a broad and well-founded judgment would dictate that the Muscle Shoals development should be interconnected for exchange of power with the existing power systems of the Southern States, and that this interconnection and exchange should be arranged for without delay, so that future construction, both at Muscle Shoals and elsewhere, can be directed for the production of plants which will supplement each other for economy of construction and operation."

(The excerpts from the report referred to are as follows:)

ELECTRIC-POWER PROBLEMS IN THE SOUTHERN STATES.

Preface.—1. The following report has been prepared to summarize the power situation in the States of Alabama, Georgia, Tennessee, North Carolina, and South Carolina (hereinafter referred to as the Southern States), as developed by the investigations of the Army engineers assigned to service in the power section of the War Industries Board. It completes the information and conclusions reached in directing power service for war industries prior to the armistice on November 11, 1918, during which time they were informed concerning the power resources and limitations in this district, and contains recommendations for increasing the annual power supply for industries in these States to meet anticipated future requirements to an aggregate increase of 1,000,000,000 kilowatt hours within the next five to seven years.

This report covers the central station electric power generating and distributing systems and gives no details of the generation by isolated plants not connected to central station systems, concerning which there is no authoritative summary as to aggregate amounts of power or costs. The report recognizes that further centralization of the power supply in these States, with the discontinuance of isolated plants, is the economic and practical end to which power service should tend. This is now, and has been for some years, the trend of the times, and the power diverted from isolated plants to central systems will constitute a considerable portion of the estimated increase of central station service contemplated for the future as discussed in this report.

It is recognized that the resources in water, power, and fuel differ in the several States, that the demand for power in the various States is diversified as to nature and amount, and that the most economical and reliable service will be attained by developing the different resources according to their relative value and interconnecting these to make a unified and balanced system, utilizing in each instance the most available source of power without regard to existing individual ownership or State lines.

4. In preparing this report and the herein contained recommendations it has been borne in mind that power delivered to points approximately central to the industrial power-consuming sections is of greater value and economic importance than power located remote from the industrial centers, which power requires for its utilization either long-distance transmission lines or the creation of new industries to be built up around the centers of cheap power. Such new industries would be mostly of an electrochemical or metallurgical nature and would afford only a relatively small return per unit of power used compared with the diversified and established industrial operations in the Southern States.

5. Central-station systems have met the war needs in a superior way and have strikingly demonstrated the advantages of centralized service as compared with isolated-plant service. In cases of increased power requirements for war production the central systems have—far more rapidly than isolated plants, and with less demand on labor and material resources—increased their capacity to meet growing needs. Also they were better able to deliver their output to those particular points where the requirements of the war industries neces-

sitated, since, for any additions to power supply for war needs in specific sections, they could draw upon the central system even when necessary by the reduction of power supply to less essential users. This could not be done in the case of isolated plants equipped to serve only the specific factories and establishments for which they were constructed.

6. This report will consider only the question of power generation by inter-connected power systems in the States above mentioned and will not concern itself with the matter of distribution of customers beyond the main generating plants, substations, and the center connecting trunk lines. The problem herein discussed has to do with steam and hydroelectric generation and the essential interconnection of generating stations to secure minimum capital cost and operating costs for power on main trunk-line systems connecting the generating plants and industrial centers. It is to be noted that a very large additional expenditure, not included in this discussion, is necessary to distribute power from these generating plants and trunk lines to power consumers, and it is observed that frequently the cost of distribution from the trunk lines to the consumers exceeds the cost of generation and the trunk-line expenses.

7. Uncertainty exists concerning the future cost of labor and material for engineering works necessary for developing power. For the purpose of comparing the cost of these developments in the different States the cost has been figured as near as may be upon the pre-war cost, plus 40 per cent. This is much less than the cost of such works during the past year and at the present time, but for comparative purposes, and as the result of careful examination, is adopted as a reasonable estimate for future work covering a period of five years.

8. The report first describes the power systems of the Southern States as they existed prior to the armistice, and the conditions under which service was rendered during the war; second, there are mentioned certain additions and improvements which are now being made, contemplated, or recommended for better economy and reliability of supply and service to the existing industries; third, recommendations are made for additional power developments to meet the future demand of 1,000,000,000 kilowatt hours, more or less, over the present demands, and also for complete interconnection of the existing power systems and future developments; and last, there is included a discussion of the power systems, of the advisability of joining the Muscle Shoals power with that of the combined system, and of the effect of interest charges on the cost of power.

Summary.—9. This report states briefly the power requirements of the Southern States and the conditions under which this power is now supplied, and makes recommendations for improving and increasing power generation to provide for public and private needs. The requirements are now supplied partly by central station electric systems, which serve diversified industries, and partly by isolated steam or water power plants built and operated individually for specific factory or other needs. In the interest of economy, reliability, and conservation isolated plant generation should be discontinued and central power substituted. Industrial development in these States and the conservation of isolated plant service and improvement of power supply will require within the next five to seven years, according to approximate estimates, 1,000,000,000 kilowatt hours increase in annual production, of which 300,000,000 kilowatt hours is allocated to the Carolinas and 700,000,000 kilowatt hours to the States of Tennessee, Alabama, and Georgia.

10. The investigation made for the purpose of this report does not include a conclusive investigation of the power resources in the Carolinas. With the data at hand we are unable to indicate that the Carolinas have any natural resources in hydropower or other sources that are suitable for the creation of this new power on a basis that would compare favorably with the production by a proposed tri-State interconnected system as described for Alabama, Georgia, and Tennessee, and it appears probable that a large part of the additional power required in the Carolinas could be more economically derived from the interconnected system of these three States. If the anticipated increase for the Carolinas is derived from these three States, the developments recommended for the latter will have a sufficient excess generating capacity to supply the Carolina requirements.

11. There are certain large hydrodevelopments that have been constructed and others that are projected in Tennessee and North Carolina by private interests for the purpose of manufacturing aluminum. These developments and projects have not been considered in this report as part of the proposed

interstate power system for the reason that the resources and requirements of the private aluminum manufacturing interests are not set forth with sufficient assurance regarding future conditions to permit of establishing a measure of the value of their resources in combination with interstate transmission lines. Unquestionably, if an interstate combination is built up as described and recommended in this report, benefit will accrue both to the aluminum manufacturing concern and to the interstate systems if interchange of power is arranged for.

12. In estimating the additional power service that can advantageously be rendered by the central station systems account has been taken of the established central station business and the reasonable expected increase in going industries. Provision has not been made in these recommendations for extraordinary additions to the power service to provide for a large, new electromechanical undertaking or for railroad electrification. One billion kilowatt-hours' increase, as described, is the foreseen requirements without these new industries of electromechanical and railroad electrification.

13. The major central station systems at present in operation in the States of Alabama, Georgia, and Tennessee have an aggregate prime generating capacity estimated at 1,230,000,000 kilowatt-hours annually, and it is estimated that the central station output should be increased by 700,000,000 kilowatt-hours annually to provide for the conversion to central station service of power now being generated by isolated plants and for normal industrial growth anticipated within the next five to seven years.

14. As the best means of increasing the aggregate capacity of the central power systems of the three States and to improve economy and reliability it is recommended that the major power systems now in these States be effectively interconnected by transmission lines and the best available resources for hydro and steam power be developed to increase the interstate combined system.

15. An examination of the central power systems for 1919 conditions shows that these systems, when operated individually, have an aggregate generating capacity capable, under commercial conditions, of producing 1,230,000,000 kilowatt-hours of prime power annually, of which 13 per cent, or 163,000,000 kilowatt-hours, in seasons of normal river flow would have to be produced by steam plants, requiring a consumption of 190,000 tons of coal annually. By effectively interconnecting these systems and operating them for the best joint economy the capacity of the combined systems would be increased to 1,370,000,000 kilowatt-hours annually, requiring in years of normal river flow the production of 132,000,000 kilowatt-hours by steam, with a consumption of 140,000 tons of coal. An increase of 140,000,000 kilowatt-hours in the generating capacity is effected by complete interconnection and joint operation, as above, which in itself is an important reason for interconnection.

16. In building for increased power production needed to convert isolated plant service to central station operation and to provide for industrial growth, the proposed interstate interconnected power system affords a marked advantage over the present plan of independent disconnected or inadequately interconnected systems, particularly as the interconnected systems would permit the use of the most economical sources of power within the area of the proposed interstate system, regardless of the relative location of these sources to localized market centers.

17. Contemplating the adoption of this plan, and in order to provide increased power facilities for the production of 700,000,000 kilowatt hours annually (the estimated requirements for isolated plant conversion and industrial growth within the next five to seven years), it is recommended that the hydroelectric plants be built on the Tallapoosa River, Ala., near Cherokee Bluff, together with a large storage reservoir. The present power systems combined with the proposed Tallapoosa plants would have a generating capacity of 2,100,000,000 kilowatt hours annually, which is an increase of 730,000,000 kilowatt hours over the capacity of the present systems if interconnected and jointly operated.

18. Building for increased power production in the three States under consideration should not, and will not, cease with the installation of 700,000,000 kilowatt hours increase in annual capacity. It is anticipated that with this increase provided for during the next five to seven years still further increased capacity should be undertaken for growth following the five-year period; and the recommendation of Tallapoosa is made with a view to later additions to the generating capacity of an interstate power system for Alabama, Georgia,

and Tennessee, and possibly the Carolinas. Developments which compare favorably with the Tallapoosa project have been examined and considered:

(a) On the Chattahooche River, at Bartlett's Ferry, in western Georgia, for increasing the capacity of the interstate system by 170,000,000 kilowatt hours annually.

(b) Two developments, referred to as Tugaloo and Mathis, on the Tugaloo River in northeastern Georgia, for increasing the capacity of the system by 240,000,000 kilowatt hours annually.

19. A large number of other developments, including steam plants at coal-mine centers, were examined and compared, but considered less favorable than those mentioned above as components of the power system composed of the present central-station systems adequately interconnected.

20. The great advantages of interconnection and joint operation of power systems, and the economies in building for increase in generating capacity, as herein stated, apply equally to a combination of the privately owned power companies with the Government power now building at Muscle Shoals. The characteristics of this Government-owned power and the gain both to the Government power and to the privately owned powers that would result from interconnection and exchange of facilities was an important consideration in the recommendation of the Tallapoosa River project, inasmuch as the interstate combination, with other power substituted for Tallapoosa, might be quite as favorable as the Tallapoosa powers in a combination without Muscle Shoals.

21. Under the present laws, the Government Muscle Shoals hydropower now building can not be connected to or operated in conjunction with private interests.

22. The Government hydropower at Muscle Shoals will be on a variable river, with opportunity for the development of a vast amount of second-class, or nine-months power, and a relatively small proportion of twelve months, or primary power. A Government-owned steam plant being built at Muscle Shoals will be capable of converting a portion of the second-class power into prime power, but it can not do so as economically as the combination with the proposed interstate power system, because if steam-plant auxiliary power is to be used with the Muscle Shoals power, other steam plants already constructed are more favorably situated than the Government steam plant for furnishing the bulk of this supplementary steam power.

23. Still further, if the Government needs do not require the entire output of the Muscle Shoals plants, it would be a criminal waste to deprive the industries of Alabama and adjacent States of this supply of power. We want to emphasize that an interconnected power system, as herein recommended, is the best possible vehicle for taking over such part of Muscle Shoals power as the Government may not require for its own uses, and delivering it to the Southern States industries, and that to make provision for doing this efficiently such use of the surplus power should be arranged for at a very early date, and considered in connection with private-plant developments to the end that these developments may be of a character that will advantageously supplement Muscle Shoals.

24. It is recognized that the resources for cheap power in the Southern States are one of their most valuable assets industrially and Muscle Shoals hydropower has long been looked upon as a favorable project, particularly in combination with Tennessee River improvements for navigation, and prior to the war a private corporation even went so far as to spend some hundreds of thousands of dollars in securing property rights and exploring foundations and making designs. It appears that with an exchange of power between the Government interests and private power systems, maximum economy will result to both interests, whereas, if the present law is enforced, the Government will lose the economic advantage of interchanging power with existing privately owned systems and the southern industries will be deprived of the benefit of Muscle Shoals power.

25. The proposed interstate power system above described including the proposed Tallapoosa River developments, and capable, as stated, of producing 2,100,000,000 kilowatt hours of prime power annually, if combined and operated in conjunction with a hydroplant at Muscle Shoals with 300,000 kilowatts ultimately installed capacity as proposed, would be capable of producing, in years of normal river flow, 2,880,000,000 kilowatt hours annually of prime hydropower without any steam generation.

Mr. MARTIN. That is a full treatment and the most recent printed treatment by the department.

On June 18 last we received another letter from General Beach, and replied under date of July 14, 1921, with regard to the question of power market, which

I would like to file for the record. He inquires the amount of power we would take from Muscle Shoals, and when we could take it. That is on the theory of the Government giving us certain advance notice of the actual date when power would be delivered. We advised General Beach that we were in the midst, then, of a power development which, however, would be absorbed completely by the market when it was completed, and that by the time the Muscle Shoals power could be completed further large demands for power in territories served by our company and immediately adjacent territory must be met, and while we did not go into details as to what the market was in that letter, I am prepared, if the committee wishes to hear it, to go fully into the question of the available power market now and as it will be by the time the Muscle Shoals development can be completed.

The CHAIRMAN. All right. Go ahead. I think that ought to be in the record whether we are directly interested now or not, because that is one of the things that will have to be considered, no matter what is done.

Mr. MARTIN. First, I would like to have these letters go into the record.

(The letters referred to are as follows:)

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, June 18, 1921.

Mr. T. W. MARTIN,

President Alabama Power Co., Birmingham, Ala.

DEAR SIR: I would like to inquire what power the Alabama Power Co. would desire or be willing to take from Muscle Shoals two years from this date, and also three years from this date, if one year's advance notice of actual date at which power could be delivered could be given and a satisfactory price is guaranteed?

Very truly yours,

LANSING H. BEACH,
Major General, Chief of Engineers.

ALABAMA POWER CO.,
Birmingham, Ala., July 14, 1921.

Maj. Gen. LANSING H. BEACH,

Chief of Engineers, United States Army, Washington, D. C.

DEAR SIR: We wish to acknowledge receipt of your letter of the 18th ultimo, inquiring what power this company would desire or be willing to take from Muscle Shoals two years from that date, and also three years from that date, if one year's advance notice of actual date power could be delivered, could be given, and a satisfactory price guaranteed.

We wrote you under date of May 28 last regarding certain aspects of this problem, to which we beg to refer in connection with our answer to your letter. As therein stated, we have insistent demands for power; that to fill its immediate requirements this company has applied to the Federal Power Commission for a license to construct an important additional hydroelectric development on the Coosa River and added:

"While it is true that the power thus secured will be completely absorbed and new sources required by the time the Muscle Shoals Dam could be completed, yet the difficulties above mentioned and the doubt which arises from the apparent reluctance of Congress to sanction an arrangement of cooperation, as shown by the clause of the act of 1916 above quoted, suggest that this company would scarcely be justified in depending upon Muscle Shoals to take care of even more remote demands which are certain to arise and which must be prepared for well in advance."

We concluded our letter in this language:

"If, therefore, authority is conferred by Congress to conclude a contract for the use of any part of the power by power companies, we wish to assure you that we are ready to work out a mutually satisfactory arrangement looking to the completion of the dam and the disposal of such part of the power as Congress wishes to place in commercial use; desiring now, as at all times in the past, to cooperate in every way desired by the United States in working out the matter."

Since that letter was forwarded to you, the Federal Power Commission has issued to this company a license to construct the Coosa development. We are planning to install 60,000 horsepower, and preliminary construction is now be-

ginning. It is our purpose to prosecute the work with all diligence with the view of having power available therefrom in the spring of 1923. While the initial installation as now planned is 60,000 horsepower, the ultimate installation will be 120,000 horsepower. In going forward with this development we considered that we were in duty bound to proceed because it did not seem at all possible that the Muscle Shoals hydro development could produce any power during 1923 or 1924. Our power demands are at present in excess of our water-power capacity, but the power which will result from the new Coosa development will fulfill our immediate requirements, i. e., will enable us in 1923 to greatly reduce our steam running and we will thus be enabled to meet the public demands during 1923, and for the most part in 1924, with the output of our hydro plants.

However, we wish to say that study of the power markets in the territory served by our company convinces us that the demands for power will require further sources which should be available during 1926 at the latest.

We must make our plans for several years in advance of actual power needs and longer notice than one year in advance of actual date at which the Muscle Shoals power could be delivered would be necessary for this company to commit itself for the taking of definite amounts of power; and unless a commitment can be made not later than March, 1922, by the United States Government for delivery of definite amounts of power, we will find it necessary to proceed with another hydro development in Alabama to meet our requirements. We will be glad meanwhile to discuss the subject with you in a definite way if desired.

Waiting for your further suggestions, we are,

Yours very truly,

ALABAMA POWER CO.,
By THOMAS W. MARTIN,
President.

Mr. MARTIN. Naturally, Mr. Chairman, if we were to assume, as we propose, an obligation to complete the Wilson Dam, there must be a market which we will find for the power, and we have gone into the question at great length.

The CHAIRMAN. You have, with a view of making this proposal, of course, studied the question. The committee would be very glad to have the result of your investigation.

Mr. MARTIN. This document prepared by the Government engineers discusses that question and what could be done immediately.

Going to our statement which we filed in the House committee hearings, it is our view that in Alabama and contiguous territory there will be a market by January 1, 1926, for additional power, part of which can be supplied from Muscle Shoals, approximately 580,000 horsepower. Now, I will give you the details of that. I will file this statement in that connection.

(The statement referred to is as follows:)

"(1) The present power and lighting load of Alabama Power Co. can be considered as 135,000 horsepower; (2) the maximum load established in December, 1921, due to urgent needs for power in Georgia and Carolina, was 160,000 horsepower; (3) with a return to normal business conditions in coal, iron, and textile industries in 1922, the power and lighting load, exclusive of requirements in Georgia and Carolina, will be 160,000 horsepower; (4) assuming 10 per cent per annum as a measure of natural growth of load, due to increased use by present customers plus new industries that will be attracted into the State by low-priced power, the load in 1926 will be 210,000 horsepower; (5) there is an available power load in territory adjacent to present transmission lines of Alabama Power Co., exclusive of railway electrification, of 160,000 horsepower; (6) there is a power load available to Alabama Power Co. by extension of lines to Memphis, New Orleans, Mobile, Meridian, etc., of 200,000 horsepower; (7) the Tennessee Power Co., the Georgia Railway & Power Co., the Columbus Power Co., the Central Georgia Power Co., in order to supplement existing plants, will absorb 70,000 horsepower; (8) railway electrification in Alabama alone offers a potential market for 240,000 horsepower; (9) the total load in 1926, inclusive of present load plus prospective load, may reasonably be 880,000 horsepower; (10) Alabama Power Co. present generating capacity, 190,000 horsepower; (11) additional generating capacity from Muscle Shoals steam plant, 80,000 horsepower; (12) additional generating capacity from Mitchell Dam, 110,000 horsepower; (13) total generating capacity available

under present program, without Muscle Shoals, in 1926, will be 370,000 horsepower; and (14) deficit to be supplied by Muscle Shoals, 580,000 horsepower."

Mr. MARTIN. The present power and lighting load of Alabama Power Co. can be considered at 135,000 horsepower.

The maximum load established in December, 1921, due to urgent needs for power in Georgia and Carolina, was 160,000 horsepower.

We have a connected load to-day of 370,000 horsepower. With a return to normal business conditions—

Senator KENDRICK (interposing). What do you mean by connected load?

Mr. MARTIN. That is customers on the line whose machinery and power using equipment amounts to a total of about 370,000 horsepower, but that does not mean that all of that load is using power at once. There is a diversity factor that enters into it and the result of that is that approximately one-half or a little more of that load calls on us at one time. That would establish what we call the peak load.

With a return to normal business conditions in the present year we will have on our system a peak load of 160,000 horsepower, according to the business which is now in sight. We assume that business will increase 10 per cent, that the normal load of our consumers will increase 10 per cent annually—

The CHAIRMAN (interposing). Without any new customers?

Mr. MARTIN. Yes, sir. That is the history of the business. A manufacturing company, satisfied with the service, will ordinarily increase its consumption 10 per cent.

Assuming 10 per cent per annum increase in the load, by increased consumption of our present customers, and some new industries which normally come into the territory, his load will approximate 210,000 horsepower by 1926.

Senator KENDRICK. Is not your estimate 520,000 horsepower in 1926?

Mr. MARTIN. Yes, sir.

Senator KENDRICK. Is not that rather conservative?

Mr. MARTIN. Yes. We excluded certain territory, certain loads which we have not taken into consideration; but the details of this sheet, which I will hand to the reporter, show step by step the loads, as I have stated, the territory embracing Memphis, New Orleans, Mobile, and Meridian, and the communities within transmission distance of Muscle Shoals, as you can see from the map on the wall. Those circles are placed at a radius of 50 miles, beginning with Muscle Shoals. You will notice New Orleans is about 450 miles, but if a system such as the Alabama Power Co. were serving New Orleans, it would run a line from the development in and around Montgomery and supplement the load from Muscle Shoals.

Senator KENDRICK. Would you expect to go as far away as New Orleans?

Mr. MARTIN. It is quite practicable. And Mobile offers a very substantial market. Many of the towns and cities in Mississippi, as you will see, are within easy transmission distance.

Senator HEFLIN. What is the distance, direct, of your power line from Montgomery to Muscle Shoals?

Mr. MARTIN. That is 175 miles.

I will not worry you with the details of this power load, gentlemen. I have placed it in the record.

Now, the committee requested us yesterday to give them some figures as to the estimated cost of completing Wilson Dam.

Our proposal contemplates, as we stated yesterday, that we will take up the construction of Wilson Dam in its present state and complete it, subject, as I stated, to the inspection of the engineers of the United States, and under the water power act, just as we are now doing at the Mitchell Dam on the Coosa River, of course, following standard lines of engineering practice. We estimate that for the 18 units proposed to be completed the cost would be about \$26,354,000. For eight units to be installed at the time of completion the cost, according to our estimate, is \$18,854,000.

To our figures, of course, we add whatever amount we pay the Government for the steam plant and whatever we expend for lines.

Senator KENDRICK. \$26,354,000 does not include all the units? That is eight units?

Mr. MARTIN. No; that is the 18 units.

Senator KENDRICK. Then the \$18,000,000 includes what?

Mr. MARTIN. Eight units.

Senator KENDRICK. The completion of the dam and eight units?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. That means how much horsepower? What is the capacity of one of those units? It is 30,000 horsepower per unit, is it not?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. The Government plan is for the installation of eight units only to begin with, is it not? That is as I remember Colonel Barden's testimony.

Major BURNS. I think he figures only on four units.

Mr. MARTIN. He figures eight units, as I recall.

The CHAIRMAN. The four units, Major, the Government has already bought the machinery for, as I understand.

Major BURNS. My recollection is that he said four units. To supply power to complete the nitrate plant requires the product of about four units.

The CHAIRMAN. About 120,000 horsepower.

Senator KENDRICK. Do you recall, Major Burns, what estimate of cost Colonel Barden put on the completion of the dam and those four units?

Mr. MARTIN. \$23,177,000 for eight units.

Senator KENDRICK. About \$5,000,000 in excess of that you place it?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. He counted on eight units, although they have only four units purchased. I think he figured, when it is completed, on putting in eight units.

Mr. MARTIN. That completes what I wish to say on direct, I believe.

The CHAIRMAN. Mr. Martin, there are a great many questions I want to ask you; but, as I understand it, you have somebody else who will take up the Gorgas plant, and you do not care to discuss it?

Mr. MARTIN. I will do it myself, though Mr. Dent should be present, but I am at your service.

The CHAIRMAN. If you want him present we will not go into it now. Will he be here to-morrow?

Mr. MARTIN. No, sir.

The CHAIRMAN. As I understood you, it was your intention, after you had explained your bid, to wait until some time later in the proceedings, when Mr. Dent will go on and take up the legal explanation of the proposition. Is that right?

Mr. MARTIN. There was only this point, Senator—

The CHAIRMAN (interposing). The committee is perfectly willing for you to take that up now and go right on, or we will go on with the next proposition.

Senator HEFLIN. Mr. Chairman, I spoke to you about Mr. Dent taking up the legal phases of the situation. He represented the Alabama Power Co. with reference to the Gorgas plant, and he proposes to argue the legal phases of it to the committee. Muscle Shoals and those projects were not connected with what he was to appear before the committee about. Is not that right, Mr. Martin?

Mr. MARTIN. Yes, sir. So far as the Gorgas plant is concerned, there is another proposal that undertakes to have the Government turn that over. Until that proposal is taken up, we did not intend to discuss that situation, but we are at your disposal.

The CHAIRMAN. You mean that in your contract that you have with the Government that is provided for?

Mr. MARTIN. Yes, sir; and until that issue is presented it is Mr. Dent's idea we would not be called upon, but we are subject to your wish. If you wish us to go ahead with that now, we are ready to do so.

The CHAIRMAN. I do not want to interfere with your plans.

Senator HEFLIN. My understanding about that is that the Alabama Power Co. claims that under contracts it would have the right to bid first, would have the first opportunity to take over the Government's interest in the Gorgas plant. The Judge Advocate General of the Army has rendered an opinion that that contract is not binding. Is that right, Major Burns?

Major BURNS. That is correct.

Senator HEFLIN. And that presents the issue that Mr. Dent will want to argue.

The CHAIRMAN. Of course there will be other parties. I assume, or other bidders will be interested in that legal phase of the proposition. It will not only be the Alabama Power Co., because where a bid is made that includes the Gorgas plant it means that it brings on a contention right away with the Alabama Power Co. because they are claiming, as I understand it, under a

contract made with the Government when the Government made the improvement that they are entitled to buy the Government's interest in it.

Mr. MARTIN. Which we think is a valid, legal, subsisting contract, the Judge Advocate to the contrary notwithstanding.

The CHAIRMAN. For instance, the Ford offer includes Gorgas. If the Ford offer is accepted, the Government must take all of Gorgas. It must take what the Alabama Power Co. has. I suppose his lawyer would argue that we have a right to do that, and the Alabama Power Co.'s attorneys will argue the other way. So in any other man's offer who includes Gorgas in his proposition.

Senator HEFLIN. Mr. Dent said he would come back when the committee wanted him to appear.

Senator KENDRICK. With this difference, Mr. Chairman, I think, that Ford's offer is that that is one of the conditions named in his proposed deal with the Government, and he cites this opinion of the Judge Advocate General as authority, while the Alabama Power Co. has it written into a contract, has this provision written into a contract. That is a real difference.

The CHAIRMAN. That is a contract that Mr. Ford would claim, I assume, is nul and void, in accordance with the decision rendered by the legal officer of the Army.

Mr. MARTIN. The legal officer probably made his decision without full knowledge of the facts.

The CHAIRMAN. That is one of the disputed questions that will be before the committee. I am not expressing any opinion on it whatever, because I want to keep my mind open until the lawyers have argued it, if I can. There are two questions involved in it. The first is the legal question: Can we avoid the contract if we want to, and, second, assuming that we could do that, do we want to? As I understand it, both those questions will be presented for the committee to decide. If we decide first that we could not avoid it if we wanted to, that the Government is bound by it as a matter of law, that is ended, and there is no use in considering any proposal in which that is involved.

Mr. MARTIN. I might mention, Mr. Chairman, that the question is before the Department of Justice.

The CHAIRMAN. It is pending before the Department of Justice now?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. I suppose the committee, if it decides to take up and pass on these offers, and leases this property to somebody, will summon before it the Attorney General or his assistants, and perhaps submit it to other lawyers and get their opinions, if they have any doubt as to what the law is. It may be that the committee will decide that we do not want to accept any offer. If we do, we do not care what the legal question involved is; we do not need to go into it.

I have introduced a bill here providing for the Government operation of this whole thing, by a governmental corporation. I would like to ask if you have examined that bill?

Mr. MARTIN. Yes, Mr. Chairman.

The CHAIRMAN. Do you care to express any opinion on it or to say anything about it?

Mr. MARTIN. Does it involve the Government furnishing the funds, all the money, and also distributing the power?

The CHAIRMAN. Well, it provides a governmental corporation. First, that the Government shall complete the dam at its own expense, and that it shall be turned over to a governmental corporation, which shall have complete control of the power, and that they shall proceed to operate these plants and make fertilizer, if they can, and sell the power if they do not want it all, to anybody who wants to buy it.

Mr. MARTIN. So far as the Alabama Power Co. is concerned, we will be very glad to cooperate in any plan that the Government works out. We feel that a greater volume of power would be available by the development of other watersheds, and other agencies, possibly, might want to take the power. We will be glad to cooperate in any Government plan that is worked out.

The CHAIRMAN. Do you care to discuss the Ford proposition?

Mr. MARTIN. Well, Mr. Chairman, I—

The CHAIRMAN. We will ask Mr. Ford to discuss yours. If you want to discuss Mr. Engstrom's proposition, I think it is perfectly proper for you to do so.

Mr. MARTIN. The answer that I would make is embodied in our statement published in the State of Alabama, on this whole question, in which we ex-

plain the differences between and the advantages of our proposal over that of Mr. Ford.

The CHAIRMAN. That is one of the things the committee is going to consider— if it is going to let this out to anybody. We want to get the best advantage we can to the Government without doing any injury to the people anywhere. We are not requiring you to do that and not requiring anybody else, but it is going to be open, and you can discuss anybody's proposition that is going to be before us, and so they can discuss yours.

Mr. MARTIN. Leaving aside the whole question of whether the bid is before the committee—

The CHAIRMAN. There is, of course, only one bid before the committee, but, of course, we believe there are going to be several other bids, and you know what they are, and you can discuss any of them now if you want to.

Mr. MARTIN. The whole question, as it seems to us, is whether the power at Muscle Shoals is to be devoted to private or public use. In our plan we propose to devote it to public use. Under the plan which is proposed by the Ford offer it will be devoted to private use. The testimony before the House committee was to the effect that there would be no power for public distribution under the plan proposed by Mr. Ford. That plan was in and of itself a contract which in its terms does not embrace the terms of the Federal water power act, hence those restrictions and conditions which the licenses under that act subject themselves to are not part of the terms and conditions under which Mr. Ford would develop the power. The license period is fixed at 50 years under the Federal water power act, with the right of the Government to recapture at the end on the basis of the investment.

There is the further question of the regulation of rates, service, and security issues; and, further, Mr. Chairman, the duty of that licensee to pay to the Government excess profits earned over the return stipulated in the license. That is one of the restrictions and obligations of the licensee under that act which is one of the very important terms that is not found in the proposal of Mr. Ford.

The CHAIRMAN. We will have to adjourn until 10.30 to-morrow morning.

(Whereupon, at 12.15 o'clock p. m. the hearing was adjourned to 10.30 o'clock a. m., Wednesday, April 19, 1922.)

MUSCLE SHOALS.

WEDNESDAY, APRIL 19, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in Room 224 Senate Office Building, Senator George W. Norris (chairman) presiding.

Present: Senators Norris, Capper, Ladd, Norbeck, Harrison, Heflin, and Caraway.

The CHAIRMAN. The committee will come to order. Mr. Martin may proceed.

STATEMENT OF MR. THOMAS H. MARTIN—Resumed.

Mr. MARTIN. All of the licensees under the Federal water power act are now subject to the restrictions and obligations to which I have referred, and I would like to insert at this point in my statement a brief memorandum with regard to some of the principal features of the Federal water power act which we feel are important to consider in the public interest in the consideration of this question.

The CHAIRMAN. Suppose you read it. The committee would like to hear it.

Mr. MARTIN. I call attention, Mr. Chairman, to certain provisions of the Federal water power law, safeguarding the public's interests, preserved by the offer of the Alabama Power Co. for the Muscle Shoals project:

"1. As a part and condition of any license issued to develop water power the project adopted, its plans, and specifications must be such in the judgment of the Power Commission that are 'best adapted to a comprehensive scheme of improvement and utilization for the purposes of navigation, of water power development, and of other beneficial public uses.' (Sec. 10 (a).)

"2. Excess profits of the licensee from the water must be paid to the United States, whether they are profits of a public utility or a private user. (Reg. 18, Sec. 106.)

"3. The franchise is limited to 50 years conditioned upon acceptance of all the terms and conditions of the act. (Sec. 6.)

"(a) The right of the United States or any State or municipality is expressly reserved to take over by condemnation proceedings and maintain and operate the project at any time during the 50 years license period upon payment of just compensation to the licensee therefor." (Sec. 14.)

That is, during the 50 years there is the right reserved in the United States to take over the property on paying just compensation.

"(b) At the end of 50 years, the right is reserved to the Government to take over the project upon payment of the net investment by the licensee, but not to exceed its fair value, and excluding any consideration for good will, going value, or prospective revenues. (Sec. 14.)

"(c) At the end of 50 years, in event the Government does not exercise the right to take over the project, preference is given to applications by States or municipalities. (Sec. 7.)

"(d) No preference right for renewal of the franchise or any proprietary claim for power is secured to the licensee. If a license is renewed, it must be under the then existing law and regulations. (Sec. 15.)

"4. The licensee can not execute a transfer of any right secured under the license or of property under license without the written approval of the power commission. All transfers or assignments, whether by judicial sale or foreclosure, must be subject to the conditions of the act. This provision is

construed by the present power commission to extend to a lease of any property under license. (Sec. 8.)

"5. The licensee is required at its own expense, under the supervision of the power commission at all times, to maintain the project adequately for purposes of navigation and efficient operation in the development and transmission of power, must make all necessary renewals and replacements and maintain adequate depreciation reserves. (Sec. 10c.)

"6. The licensee is required to provide, free of cost, power for operation of all navigation facilities (sec. 11c), and authority is reserved in the Government at all times to prescribe regulations in the interest of navigation including control of the pool level and installation of necessary lights and signals. (Sec. 18.)

"7. A licensee which is a public utility corporation must abide by such reasonable regulation regarding the services rendered its customers and its rates and charges of payment therefor as may be prescribed by the State; and if there be no laws of the State regulations, rates, services or security issues, then the Federal Power Commission exercises such regulation (sec. 19), and if the power enter into interstate commerce and the States can not agree, then the Federal Power Commission makes such regulations. (Sec. 20.)

"8. All power sold in public service entering into interstate commerce must be 'reasonable, nondiscriminatory, and just to the customers, and all reasonable discrimination and unjust rates or service are hereby prohibited and declared unlawful.' (Sec. 20.)

Even where the licensee sells to another company for resale to the public, the act undertakes to regulate rates, service, and security issues of that purchaser from the licensee, in the event there is no local regulation.

"9. After 20 years of operation amortization reserves are required out of surplus earned thereafter; if any in excess of a specified reasonable rate or return upon the actual, legitimate investment to be held until the termination of the license or applied, in the discretion of the power commission, in reduction of the net investment of the licensee. (Sec. 10d.) This rate has been fixed by the rules and regulations of the power commission.

"10. The licensee is required to make equitable contribution for benefits accruing to it from headwater improvements either by storage reservoirs or otherwise, whether done by other licensees or by the Government." (Sec. 10f.)

An important provision, Mr. Chairman. That is one of the more or less uncertain obligations assumed, but which the licensee must assume.

"11. 'Combinations, agreements, or understandings, expressed or implied, to limit the output of electrical energy, to restrain trade, or to fix, maintain or increase prices for electrical energy or service are prohibited.' (Sec. 10h.)

"12. The right is expressly reserved to the United States at any time, in the opinion of the President, to take over the project when the safety of the United States demands, for 'manufacturing nitrates, explosives, or munitions of war, or for any other purpose involving the safety of the United States,' involving a liability only for just and fair compensation for use of the property taken, to be determined by the power commission upon a basis of a reasonable profit to the licensee in peace time, plus the cost of restoring the property to as good condition as when taken, less a reasonable value for improvements made by the United States that are serviceable and valuable to the licensee." (Sec. 16.)

The offer of Mr. Ford requires the Government to protect the company from losses by such use and to return the property in as good condition as received, plus reasonable compensation for the use thereof.

"13. The United States court is vested with authority to revoke for violation of its terms any licenses issued thereunder, or to remedy or correct by injunction, mandamus, or other process any act or order of commission or omission promulgated thereunder, in violation of the act or of any lawful regulation issued thereunder."

Now, Mr. Chairman, it appears from the first annual report of the Federal Power Commission that to November 1, 1921, licenses were issued for power developments totaling 1,280,055 horsepower, and that applications were pending as of that time for an additional installed capacity of 16,826,255 horsepower.

Since November last certain applications have been granted and licenses issued increasing the total power development now in progress and under construction under license to approximately 1,500,000 horsepower.

During the period beginning November 1, 1920, and ending February 1, 1922, there were issued and sold high-grade investment securities of lighting and power companies in the total amount of \$472,450,000, of which total \$145,493,000

were issued and sold by hydroelectric companies. An examination of these securities issues shows that the bulk of them were sold during the period of November and December, 1921, and January, 1922.

It is estimated that for 1922, and for the next several years, \$733,000,000 per year will be required to maintain electric-light and power facilities equal to the growing demand throughout the country.

The output of electrical energy during 1921 totaled 43,100,000,000 kilowatt hours, of which 26,000,000,000 kilowatt hours of energy was derived from fuel and 17,100,000,000 kilowatt hours of energy was derived from water power.

Of this total output the privately owned companies generated slightly more than 97 per cent of the total electrical energy produced in the country.

Now, I have recited these statements for this reason. When it is considered that a large amount of steam energy being used can be produced by water power, and that if the great burden of meeting the growing demands in this country from year to year for power is to be met by the privately owned companies, it is apparent that the national policy of the Government, as expressed in the Federal water-power act, is of great public importance to the end of obtaining continued, consistent development of the hydro resources of the country. In no other way can the great volume of funds be raised than by following this consistent policy.

I am led to make this statement because the Muscle Shoals situation is by one plan proposed to be developed for the benefit of one of the proposers under a plan which amounts virtually to a great Government subsidy, and, in fact, it will seriously handicap the developments which ought to be made in that great territory by others unless there is a purpose in behalf of the Government to go forward and undertake all of the hydro developments. When it is considered that upward of \$700,000,000 per year should go into the hydroelectric industry over this country, you can appreciate the great burden which the Government would be under if it were planning a consistent policy to supply the further needs of the country.

The companies engaged in power development are making their plans in many parts of the country to go forward under licenses granted by the Federal Power Commission. This law is restrictive in many respects, but it is quite possible to finance and develop many of the greatest projects in this country under the law.

The CHAIRMAN. Let me see if I understand you now. I was interrupted, and would like to follow you all the way through.

Your contention is that the Government ought not to go into the business of developing this hydroelectric energy unless it covers the whole field. Is that the idea?

Mr. MARTIN. My contention is more directed to the consideration of the question of development in the interest of one of the proposers using Government funds and under conditions which amount virtually to a Government subsidy for the benefit of one individual. Our position is simply that licensees under the Federal water power act must provide their own funds, make their own development, assume numerous obligations, which we have briefly referred to; and in fairness to all who undertake power development in this country it seemed that all should be upon the same basis of development.

Senator HARRISON. May I ask you when did you make your proposal to complete the work at Muscle Shoals?

Mr. MARTIN. Our first proposal was made, Senator, in 1913.

Senator HARRISON. 1913?

Mr. MARTIN. Then again in 1916. We donated the property of the Wilson Dam site to the Government in 1918. Our next correspondence after those years was in 1921.

Senator HARRISON. Are those proposals much the same as your present proposal?

Mr. MARTIN. No, sir.

Senator HARRISON. They were quite different?

Mr. MARTIN. They were different. They were set up on a different principle.

Senator HARRISON. Were you influenced in making this proposal by the proposal of Mr. Ford?

Mr. MARTIN. We have always been interested in the situation.

Senator HARRISON. I understand you have, and you have made the great development down there; but was it Mr. Ford's offer that caused you to make this particular proposal?

Mr. MARTIN. When it became apparent that the Congress proposed to go forward and complete the project, and devote at least a part of the energy to public service, it was that, together with the fact that important parts of our property were involved, that caused us to submit the proposal. We advised the Chief of Engineers in May, 1921, that we were prepared, whenever the Government desired to place any part of this power in commercial service, to work out a plan that was satisfactory to the Government, so far as we could. That letter has been placed in the record.

The CHAIRMAN. Was that before the Ford offer was made?

Mr. MARTIN. Yes, sir. We had numerous discussions with the Chief of Engineers, and which resulted in our letter of May 28, 1921, followed by another letter to the Chief of Engineers in July, 1921, both of which were placed in the record on yesterday.

Senator HEFLIN. Was any mention of those suggestions ever made by the Secretary of War that you know of?

Mr. MARTIN. Yes; he mentions them in his testimony.

Now, I wish, Mr. Chairman, to place in the record a very brief summary of classes of service our company is rendering the public in Alabama. Our company, from five customers in 1914, with a load of 7,500 horsepower derived from two municipalities, one cement plant, one brick plant, and one cotton mill, has increased that load so that at the end of the past year our connected load was 370,000 horsepower, with an electrical output of 500,000,000 kilowatt hours annually.

At the present time the Alabama Power Co. is rendering service to 158 major industries, or classes of users, consisting of:

<i>Ratio to total consumption.</i>		Per cent.
2 brick plants.....	-----	0.25
2 cement plants.....	-----	6.67
46 coal mines.....	-----	7.46
30 cotton mills.....	-----	21.50
7 cotton gins and oil mills.....	-----	.52
11 foundries and machine shops.....	-----	.70
5 graphite plants.....	-----	.04
7 ice plants.....	-----	.61
9 ore mines.....	-----	2.16
1 manganese plant.....	-----	6.84
3 municipal lighting systems.....	-----	.46
3 municipal pumping plants.....	-----	.31
18 public utilities.....	-----	37.85
8 lime and marble quarries.....	-----	2.02
4 steel plants.....	-----	12.10
1 United States Government—nitrate.....	-----	.49
1 United States Government—camp.....	-----	.02

158

100

These various classes of industries will consume approximately 70 per cent of the total power output; that is, the industries, notwithstanding the fact that from this system there is furnished the house lighting, street lighting, and street railway operation to a total of 63 municipalities, these industries will consume 70 per cent. In other words, the greater part of this energy goes to industries throughout the State.

The CHAIRMAN. Are all of those customers in the State of Alabama?

Mr. MARTIN. Yes, sir. Now, I wish to mention one typical example—

Senator HARRISON (interposing). Will you put in the record the names of the directors of the Alabama Power Co.

Mr. MARTIN. Yes, sir. They are as follows:

Board of directors of Alabama Power Co., Birmingham, Ala.: Thomas W. Martin, Birmingham, Ala.; W. N. Walmsley, Birmingham, Ala.; Lawrence MacFarlane, Montreal, Canada; W. H. Hassinger, Birmingham, Ala.; C. E. Groesback, New York City; R. M. Hobbie, Montgomery, Ala.; W. J. Henderson, Montreal, Canada; F. M. Moody, Tuscaloosa, Ala.; Harold S. Swan, New York City; Gerhard M. Dahl, New York City; W. H. Weatherly, Anniston, Ala.; S. Z. Mitchell, New York City; R. A. Mitchell, Gadsden, Ala.; Walter M. Hood, Birmingham, Ala.

The CHAIRMAN. What is your capital stock?

Mr. MARTIN. \$18,751,000 of common stock.

The CHAIRMAN. Paid up?

Mr. MARTIN. Yes, sir; plus various issues of preferred stock.

The CHAIRMAN. You have issues of preferred stock?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. How do you happen to have preferred stock?

Mr. MARTIN. We sell preferred stock and bonds to raise new capital for additions and extensions to our system. There is one important point which must always be kept in mind in dealing with this subject, viz: That public utilities are subject to regulation by public-utility commissions of the State in which they operate, other business enterprises are not. Our company being a large enterprise, is called on constantly to enlarge its service. It must, of necessity, therefore, seek a broad field for the sale of its securities because it is not permitted to earn a return sufficient to enable it to meet these requirements for funds. State regulation of rates and securities does not permit this company, nor any other regulated utility, to accumulate money for improvements and extensions. It is a fundamental principle of public-utility regulation as laid down by the courts and commissions that the earnings shall be sufficient only to pay operating expenses, taxes, provide for depreciation, and, in addition, a fair return on the property employed in the service of the public. This limitation of earnings to a fair return makes it necessary that the utility make additions and extensions to its property out of new capital. Obviously, we can not sell bonds secured by mortgage to provide the entire amount of this new capital. The present-day investor will not purchase a bond unless part of the funds for the work are provided from stock or some other similar source. Therefore, our company, and many others, have worked out the plan of selling bonds to provide the principal part of the money needed, the balance to be provided by the sale of common or preferred stock.

The reason for this principle of rate regulation is obvious. The utility can not make the customer of to-day pay (in his rates for service rendered) for the cost of improvements or extensions from which only the coming generation of customers may benefit. In other words, the customer of to-day should pay only the cost of serving him to-day, including depreciation, and a fair return upon the property; but he can not be required to contribute, in addition to his rate, money for improvements and extensions. This must always come from new capital.

This new capital for new work in the way of extensions and additions does not, of course, weaken the position of previous investors in the company securities, because these extensions and additions serve to add to the value of the property and its ability to handle a greater volume of business. The rule that the company is entitled to a fair return upon the value of its property applies to the new capital as well as to the old. As an extension or improvement is made, that investment becomes a part of the value of the property, upon which the company is entitled to a fair return.

The CHAIRMAN. Is there any water in any of the stock?

Mr. MARTIN. No, sir.

The CHAIRMAN. Some of the stock was issued for property?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. How was the value of the property appraised?

Mr. MARTIN. That has been some years ago, Senator.

The CHAIRMAN. Where is the majority of the stock held?

Mr. MARTIN. The majority of the stock is about something in excess of 40 per cent. 40 to 45 per cent, owned in Alabama and other States of this country. There is a small percentage owned by various citizens of Canada.

Senator HARRISON. What percentage of the stock?

Mr. MARTIN. Well, possibly 5 to 8 per cent in Canada. The balance is owned in foreign countries, principally England.

The CHAIRMAN. That would mean about 50 per cent in European countries?

Mr. MARTIN. Foreign countries. Possibly. That was due to this situation: When these developments were projected in 1912, and prior to that, the citizens of our State sought everywhere in this country and in foreign countries to find people with money to make developments. Captain Lay, a citizen of our State, who is well known to Senator Heflin, was possibly the prime mover in getting capital. He interested, after many years of effort, Mr. James Mitchell, a citizen of this country, and in 1912 Mr. Mitchell undertook to take up this power de-

velopment. He financed the development principally in England and other foreign countries.

I am frank to say there was a lack of confidence—I am afraid that there was a great lack of confidence in these developments in this country. Mr. Mitchell obtained money from abroad and went forward with a policy of development.

When the war began in 1914 it became necessary to alter the entire plan of financing. Whereas prior to 1914 the securities were principally held abroad, since 1914 and down to the present time the situation has been reversed because of conditions which have been developed in these hearings. More confidence became evident on the part of investors in this country, and since our pioneer developments, and as a result of the pioneer developments, the investing public has come to look with favor upon the development, and our company has gradually been able to sell its securities on a better basis from year to year, and has found ready markets and is finding ready markets for its securities now. So that out of our total issue of securities at the present time there is in excess of 60 per cent. approximately 63 to 65 per cent. of all the securities held in the United States—all classes of securities. The balance are held—35 per cent or possibly just a little more—in Canada and other foreign countries.

Those foreign-owned securities, or a part of the securities originally held abroad, have returned to this country since 1914 in large volume, due to conditions which you gentlemen are familiar with, namely, exchange conditions and war conditions; the fact that the market value of such investment went down, and for one reason and another they have been returning to this country in large volume.

Senator HARRISON. Is your stock listed on the stock exchange?

Mr. MARTIN. No, sir.

Senator HARRISON. Are the securities held pretty generally, or are they—

Mr. MARTIN. Yes, sir; they are widely owned.

Senator HARRISON. The business has been and is fairly successful?

Mr. MARTIN. To this extent. Our company has paid all of its fixed charges. There have been no dividends on stock except on the issues of preferred stock sold in the last few years, which we have sold entirely to the public in this country—in Alabama and other States. Dividends have been paid on those issues, but earlier issues of securities, preferred and common, have never had any dividends. The company has been successful in extending its business, and what surplus the company has been able to make has gone back into improvements and extensions from year year instead of into dividends.

Senator HARRISON. Your operation is pretty well localized in that State?

Mr. MARTIN. Our operations are localized entirely in the State, from Montgomery on the South—

Senator HARRISON. That is, you have none in any other part of the country?

Mr. MARTIN. No other interest, except in Alabama.

Senator CARAWAY. Mr. Martin, how much of your power is developed or generated by water?

Mr. MARTIN. At the present time, about 85 per cent.

Senator CARAWAY. That is capable of being increased?

Mr. MARTIN. We are developing a new hydroelectric station now which will supply, we hope, 95 per cent of the time, all the power we need for the next year or two, supply all the hydro power for all development.

Senator CARAWAY. You have a market now for all the power you generate and will take on at those two projects?

Mr. MARTIN. We are taking on new consumers.

Senator CARAWAY. Have you got the power to do it?

Mr. MARTIN. We have not, and for that reason, anticipating the demands for power, we obtained from the Secretary of War last fall a lease of the Sheffield steam plant, subject to termination at the pleasure of the Secretary of War to enable us to supply demands arising during the present year and which, after the present year, we will carry on the new hydroelectric plant on the Coosa River.

Senator CARAWAY. Are there any additional sites for water-power development on the river?

Mr. MARTIN. Yes.

Senator CARAWAY. Do you own that site, or your company?

Mr. MARTIN. We own two additional sites; one additional site and some holdings at another site.

Senator CARAWAY. Does that give you a complete control over the water-generated power in that country, or are there other sites?

Mr. MARTIN. We have some other sites in our storage developments on two other rivers.

Senator CARAWAY. Are there any that are not controlled by your company except Muscle Shoals? About how much power can they develop besides Muscle Shoals? I don't want you to go into a big long statement.

Mr. MARTIN. We have estimated somewhere between five hundred thousand and a million horsepower in various developments in Alabama in which we have no interest.

Senator CARAWAY. A million horsepower?

Mr. MARTIN. Five hundred thousand to one million horsepower.

Senator CARAWAY. Five hundred thousand to a million that could be developed at power sites that you do not own?

Mr. MARTIN. Yes, sir; and outside of Muscle Shoals.

Senator CARAWAY. Are there consumers enough to absorb that much power?

Mr. MARTIN. Not at the present time. Well, I won't say at the present time.

Senator CARAWAY. You pretty well cover the field now?

Mr. MARTIN. Well, we are endeavoring to meet the demands in the territory which our lines reach, and endeavoring to meet other demands in other sections, but we can not meet them.

Senator HEFLIN. Do you serve any municipalities outside of Alabama and Tennessee or Georgia?

Mr. MARTIN. No, sir. We have no service outside of Alabama.

Senator CARAWAY. You spoke of serving 18 public utilities. Does that mean street car lines?

Mr. MARTIN. Several street car lines.

Senator CARAWAY. And what other that you class as public utilities?

Mr. MARTIN. I have reference to other concerns that are classed as public utilities, other companies engaged in public service.

Senator CARAWAY. What kind of public service?

Mr. MARTIN. For instance, the Birmingham Railway & Power Co.

Senator CARAWAY. What is that company?

Mr. MARTIN. They have a street railway and also supply the light and power in the district known as Greater Birmingham. All of their electric energy is provided by our company.

Senator CARAWAY. Do you furnish all of the electric energy to Birmingham?

Mr. MARTIN. We do.

Senator CARAWAY. If Muscle Shoals is developed and you do not have control of it, will it be in direct competition with your company?

Mr. MARTIN. Well, I don't know how that will work out, Senator.

Senator CARAWAY. Apparently it would?

Mr. MARTIN. Well, Mr. Ford's engineers have figured on not engaging in any public service. On the other hand, there is some intimation that he would. I don't know.

I want to mention one example of growth and increased use of power in our State.

Some time prior to 1911 the communities of Anniston and Talladega having a population of 18,648, had a combined power load of say 2,000 horsepower. It was planned by the citizens of the State of Alabama to serve those communities from what is known as the Jackson Shoals power development with electric lighting and power by erecting a hydro plant at what is known as Jackson's Shoals on Chocologoco Creek. Sufficient local capital could not be obtained for this purpose and foreign capital was sought. After much delay the owners of the company succeeded in financing it. The water-power plant was constructed with 2,000-horsepower capacity in 1911. It soon appeared, however, that the increased demand for power was such that it could not even supply one of these communities and arrangements were made by which the Alabama Power Co. came into the situation in 1913 and purchased that power development at Jackson Shoals, combining it with its present system. Those two communities of Anniston and Talladega were at that time supplied from that small power development, and from a demand of something less than 2,000 horsepower in those communities in 1911 the demand increased for lighting and power to 45,000 horsepower at the peak of the war demand in 1918, which the power company supplied from its system. It will be seen, of course, at once, that no such development as was originally planned, 2,000 horsepower, would in any way have met the local needs. There are now located in Talladega and Anniston cotton mills, pipe plants, foundry and machine shops, and a variety of businesses which are dependent upon power such as our system supplies for their efficient operation.

This community's greatly increased use of electrical energy is typical of the growth and use of many communities in our State, though not as large as that.

The CHAIRMAN. Mr. Martin, is not that always dependent upon the price at which power is supplied?

Mr. MARTIN. Absolutely.

The CHAIRMAN. If your company in those communities where this wonderful development has taken place had not supplied power at a cheaper price than it could be obtained elsewhere that development would not have taken place?

Mr. MARTIN. That is correct, Senator.

The CHAIRMAN. So that it must always follow, if there is to be development from the building up of hydroelectric stations, that the power furnished must be cheaper than the existing power or there will be no development?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. And that development always follows where cheap power is generated. Is not that true?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. And developments of that kind, locally, in a radius of five or six hundred miles, are going to depend upon what they have to pay for this energy. Is not that true?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. It will not develop unless they can get cheap power.

Mr. MARTIN. Yes, sir; that is quite true, Senator.

The CHAIRMAN. If they can not get it cheaper than other communities can supply it, naturally the development of machine shops and all other kinds of users will go into that other community?

Mr. MARTIN. Yes, sir. I might mention that the Department of Commerce publication, issued in 1920, shows in table No. 28 that the average cost per horsepower year to consumers of electric power in Alabama had decreased 70 per cent in the decade between 1907 and 1917.

Senator HARRISON. Have you there the figures that show the decrease at Buffalo, say, and Niagara?

Mr. MARTIN. May I just complete this, Senator?

Senator HARRISON. Yes.

Mr. MARTIN. On the other hand, the cost per horsepower year to consumers of electric power in the State of Mississippi had decreased only 4 per cent in the same period, thus evidencing the great influence on power costs of hydroelectric development. The fall line vanishes when you get down into Alabama. There are no further developments possible west of Alabama.

The CHAIRMAN. There is not fall enough in the river?

Mr. MARTIN. No. That 70 per cent decrease in the cost of power is reflected in the increase of industries in our State. Here is a chart which will indicate to you how industries have developed in various Southern States as a result of the increased use of power or as a result of the availability of power. You will see the difference in such States as Mississippi and Alabama. Alabama shows a variety of industries greater than any of the States shown.

The CHAIRMAN. This map shows great increases have taken place in Alabama, Georgia, South Carolina, and North Carolina?

Mr. MARTIN. And in Tennessee.

The CHAIRMAN. And in Tennessee, yes; and no development seems to have taken place near the coast line. I presume that is because the country gets flatter as it goes down toward the river?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. There is no fall in the river?

Mr. MARTIN. Yes, sir.

Senator HARRISON. It may be that this is already in the record. I am not sure. But I think it would be well if we could get a comparison of the prices of electric energy at Niagara and Buffalo, so as to compare it with what you have in Birmingham and other cities.

Mr. MARTIN. I will have to get you that later, Senator.

Senator HARRISON. Do you know whether or not it compares favorably in price?

Mr. MARTIN. Yes.

The CHAIRMAN. There has been a great reduction in price up there since the Niagara development?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. I can not give the figures, but I have read them.

Mr. MARTIN. Of course, you must bear in mind that at Niagara there is a great reservoir of water and there is no variation in the stream flow.

The CHAIRMAN. Then at Niagara they have what you would have in the Tennessee River if we were able to build storage reservoirs that were practical?

Mr. MARTIN. Without the expense of storage.

The CHAIRMAN. Without the expense of building the storage. That is true.

Senator HARRISON. Some four or five years ago, in the investigation of the Niagara Falls project, it appeared that the prices were very high, and the people up there were up in arms against the company, against the company's charging such high prices. I wish you would put into the record, if you can, a comparison of the price that we charged at Buffalo, say, and Niagara, and then compare it with Birmingham and Anniston.

The CHAIRMAN. Senator, some of the prices that he gave yesterday that consumers paid down in Alabama were outrageously high, I think.

Senator HEFLIN. He mentioned Opelika particularly.

The CHAIRMAN. The consumers paid as high as 12 cents per kilowatt hour for electric light in their homes.

Senator HARRISON. Of course, the greater the distance of transmission of energy the higher the price, is it not, generally?

Mr. MARTIN. That is true, Senator, in some systems. I would like to say, however, that the prices mentioned by the chairman as being high were the prices charged the public by municipally owned lighting systems. Take the Ontario power system, which has been developed by the government of Ontario. There the price varies with distance for all classes of users. It is the policy, however, of all central-stations companies of this country, such as ours, to endeavor to maintain a schedule at all points of the system the same.

Senator HARRISON. The prices in Canada are much cheaper than the price over in the United States for the same power?

Mr. MARTIN. I don't know that I want to say that, Senator.

Senator HARRISON. It was some years ago, unless it has been changed.

The CHAIRMAN. The witness may not be informed on the subject, and I may be wrong about it, but my understanding has been that the prices to consumers in Canada as compared to the prices to consumers on this side of the line for power developed from Niagara in both cases are very much cheaper.

Mr. MARTIN. There is a very wide variance between prices paid by consumers in different localities in Ontario. You will find a very elaborate treatment of this question in a recent publication by Mr. W. S. Murray, in which he made a survey of that whole question, comparing prices on the Canadian side with prices on the American side, and also the prices in California.

The CHAIRMAN. Where did you say we will find that?

Mr. MARTIN. I will hand you a volume of it, if you wish to have it.

The CHAIRMAN. I think it would be a good idea to put that in the record.

Mr. MARTIN. It is a volume of 500 pages, Senator, but I will put a synopsis of the report in the record at this point.

EXHIBIT A.

Memoranda of facts and conclusions contained in the report of Messrs. Murray and Flood of March, 1922, on the development and operation of the electric light and power utilities of the Hydro-Electric Power Commission of Ontario:

The engineering firm making the report is comprised of Mr. W. S. Murray, who conducted the superpower survey on the Atlantic seaboard between Boston and Washington for the Department of the Interior of the United States Government and who, in addition, is conversant with Canadian conditions, having acted in a consulting engineering capacity for municipal and provincial bodies, and Mr. Henry Flood, Jr., formerly engineer-secretary of the United States Government superpower survey organization.

Government ownership and operation of electric light and power utilities, as exemplified by the Hydroelectric Power Commission of Ontario, is not a success from the viewpoint of either service or low cost, as compared to privately owned and publicly regulated electric light and power companies in the United States and Canada.

This in effect is the outstanding conclusion in the report made to the National Electric Light Association by Messrs. Murray and Flood. It is buttressed by a mass of contributory evidence gathered first-hand by the engineering firm in an

exhaustive investigation begun on August 22, 1921, and covering the period up to February 10, 1922, when the report was presented.

The printed report contains more than 225 pages of printed matter and charts. In it the engineers trace the development of the Hydroelectric Power Commission of Ontario since its inception. They compare its growth and operation with the growth and operation of electric public utilities in the Province of Quebec and in sections of the United States, and give comparative and pertinent statistics on the bonded debt, revenue, operating expenses, taxes, wages, etc., of municipally owned and privately owned Canadian electric utilities.

The investigation was made for the purpose of obtaining complete economic data from which to draw a comparison between governmentally owned and privately owned utilities. This naturally led to a consideration of the political and economic structure of the Hydroelectric Power Commission of Ontario, which operates the largest Government-owned system in existence, and to a comparison between that system and others privately owned and operated, but subject to public regulation both in the United States and Canada.

In the report Mr. Murray is careful to state that it is not intended to dim the glory of the achievements of the Hydroelectric Power Commission of Ontario, which, he says, has replaced certain unregulated private utilities whose operation was far inferior to it. The principal problem was to determine whether there was anything in the Ontario plan to commend it for application in the United States.

In summarizing the results of the investigation the report asserts that no system of electric service such as that operated by the Hydroelectric Power Commission of Ontario is applicable in the United States, for the reason that it is subversive of American policy and custom, and in addition is inefficient, expensive, and wasteful. It shows that the service rendered by privately owned utilities under public regulation is cheaper and better than that rendered by governmentally owned utilities, and that even in Ontario, which has what is generally looked upon as the most successful example of Government owned utilities, private capital and enterprise have contributed more to the upbuilding of civic, industrial, and commercial life than has the Government owned project.

In the summary of conclusions at the front of the report appears the following:

"After careful analysis of the governmentally owned, controlled, and operated electric utility structure as represented in the Hydroelectric Power Commission of Ontario, I am of the opinion, firstly, that the principles of its application can find no place in the United States; secondly, that to attempt the substitution of its principles of control and operation within the States would be to strike a blow at economic structures, the present existence of which are not only far better equipped to protect the public interests in their conjunctive relation with the public service commissions of the States regulating their rates, but it would also be to strike an equal blow at the shareholders of the electric utilities which are now serving the American public; and, thirdly, that the Hydroelectric Power Commission owes its being only to the fact that a public service commission on the order of those operating in the States was not in existence in the Province of Ontario at the time of its creation."

In support of the above statement the report recites that in order to be superior in kind to that supplied by the privately owned electric utilities of the United States, power as applied in Ontario from the governmentally owned and controlled system, in associate relationship with the Hydroelectric Power Commission, must be more adequate, more reliable, and cheaper. "The facts show, however, that the electric utilities of the States hold more power in reserve and sell more energy per capita served," says the report, "that, by that token they can claim a greater reliability of supply and that the supply is cheaper to the consumer."

Also in support of the statement of conclusions the report asserts that at the end of the fiscal year 1920 only 23 per cent of the total power-plant capacity operated by the Hydroelectric Power Commission was constructed by the commission, the remainder representing plant capacity, was constructed at the initiative and risk of private investors and acquired from those investors by the commission. The report states that in acquiring ownership of it, intangibles, such as franchise rights and good will, were included in the purchase price. This intangible cost, therefore, being represented in power "at cost," such intangibles also necessarily would be included in the cost

of any governmental plan of like characteristics which might in the future be inaugurated in the United States.

"The building of new power-plant facilities under the auspices of governmental ownership, as shown in the cases of Nipigon and Chippewa, both in respect to policy and to cost, is not to the economic interest of the people," continues the report.

"The advocates of Government or municipal ownership of electric utilities claim reduction in the cost of power in virtue of: (a) Elimination of taxes; (b) elimination of dividends; (c) elimination of high-salaried executives; and (d) more economical wages and higher efficiency in labor scale.

"With regard to (a) the taxes are not eliminated. Just as much money in taxes is paid. The difference is in their distribution. In the case of private ownership only the users of service pay the tax bill, while in the case of Government owned utilities all the people pay the bill.

"With regard to (b), (c), and (d), notwithstanding dividends, high-salaried executives, and the wage and labor claims, the answer is, when the total operations are summed up, the people receive the power at less cost through private ownership under regulations.

"The investment of capital in electric utilities under private-interest control is far better protected from extravagance than when that capital is governmentally owned for the reason that plans and estimates for such capital expenditures not only must gain the approval of a trained engineering and managerial staff and an experienced board of directors of the companies, but it also must have the critical review of the bankers and the private financial investors. In the case of Government owned utilities the directing heads are seldom specially trained in the business under their jurisdiction and the value of securities is not based upon the value of the property or the efficiency of the management but upon the taxing power of the Government.

"Arms, legs, and body are useless without the head. A high-salaried executive usually saves many times (his salary included) the losses incurred by the cheaper and less efficient executive. Accomplishment by individuals in control of private enterprises is under keener observation than is the case when those in charge are governmental or municipal officers.

"Governmental ownership eliminates all incentive for gain and throttles initiative. This is evidenced by the far greater growth of privately owned utilities.

"The Hydroelectric Power Commission is the judge of its own acts. A commission can not fairly be the judge of its own (and others) rights in contentions."

Further, in support of the conclusions drawn the report calls attention to the fact that "honesty of purpose does not necessarily reduce the power bill," but that so far as price is concerned the structure under which it is administered is what really counts. The report says that American companies in the Niagara district are supplemented by steam power far more than are those on the Canadian side, but that in spite of this increased cost for the benefit of the consumers and the public generally power is being furnished at a lower cost on the American side than upon the Canadian side under the direction of the Hydroelectric Power Commission.

In discussing the relative value of the governmental structure as represented by the Hydroelectric Power Commission of Ontario and the regulatory bodies of the several Commonwealths of the United States the report says:

"The commissions of the States fully realize that protection to the people lies in protection to the electric utilities from which they are receiving power. The authority delegated to them to regulate rates and the constitutionality of the law standing behind any action on their part or upon the part of the electric utilities provides a structure constructively balanced to do justice to all parties."

Throughout the report Messrs. Murray and Flood praise the personal integrity and honesty of purpose of Sir Adam Beck, chairman of the Hydroelectric Power Commission of Ontario, and his associates and staff. They also accord Sir Adam Beck and Mr. F. A. Gaby, chief engineer of the commission, for their fair and unbiased attitude in furnishing facts upon which the report, including its summary of conclusions, is predicated. Throughout the report copies of correspondence between Mr. Murray and Sir Adam Beck and Mr. Gaby show that the figures and other statistical material used as a basis for the report are most conservative, and were furnished by those two officials of

the commission with full knowledge of the fact that they were to be embodied in a report.

In a letter dated September 9, 1921, Mr. Murray addressed Sir Adam Beck, and after explaining the commission given him by the National Electric Light Association, stated:

"The report I am to render, while having much to do with the two former subjects (engineering and construction features of the commission's projects with which Mr. Murray was conversant because of his previously having been retained for a period as consulting engineer) is more particularly related to the political and economic structure as existing in the States and in Ontario, and you, therefore, will understand that I would take an impossible position to refuse to attempt collecting the complete facts of both situations, and be governed in my conclusions by them."

In the same letter Mr. Murray inclosed a set of questions prepared by him. The answers to these questions form the real basis for the subsequent investigation conducted by the engineering firm.

The Murray and Flood report, which consists of 226 printed pages, including 41 color plates and diagrams visualizing the statistics given, details the history of the origin and development of the Hydro-Electric Power Commission, stating that—

"The plan of governmentally owned and operated electric utilities grew out of the belief by seven municipalities lying within transmission distance of the Niagara Falls that power therefrom could be generated and transmitted to them at a cost far less than that being paid for the supply received from private companies"—

and that later the plan spread through the Province of Ontario until to-day more than 200 municipalities are receiving Hydro-Electric Commission power. The movement started in 1900, when the Ontario Power Commission estimated that a generating plant at Niagara, with contemplated capacity of 30,000 to 100,000 kilowatts, could be constructed upon a basis which would make possible the delivery of electric energy at a cost of \$4.95 per horsepower year. Following the report of this commission, its successor, the Hydro-Electric Power Commission, was created in 1906, and was given almost unlimited authority and power, even to the extent of the making of contracts for, and the issuance of, bonds in any amount which should be valid claims against the municipalities and the Province. Additional powers have been granted since the original organization of the commission.

At the outset the commission elected to purchase power from existing companies rather than to construct generating plants and distribution systems. In line with this decision it contracted with the Ontario Power Co. of Niagara Falls for power to be supplied to municipalities of Ontario at a cost of \$9.40 per horsepower year for the first 25,000 horsepower, and \$9 per horsepower year for all power in excess of that amount. This was a 10-year contract, to expire in August, 1917, but in 1916 the commission's requirements had grown to such an extent that it was necessary to purchase additional power from the Canadian Niagara Power Co., at the rate of \$12 per horsepower year. Under this contract the company was selling an average of about 68,000 horsepower per year to the commission.

Under the Hydro-Electric Power Commission act all electric power must be sold at cost. Naturally, the power produced at Niagara is produced at the lowest cost, not only within the Province of Ontario, but upon the entire American Continent. This power is transmitted to municipalities, frequently within the same zone as other municipalities receiving electric light and power service from other generating sources. The result is a wide variance of costs because of the difference in generating costs. Under the system of rate making and public regulation in the United States (California is used as a typical State), as well as in Quebec, it is the aim of electric light and power companies and of regulatory commissions to equalize costs so that as far as possible all communities will be upon an equal basis so far as power costs are concerned, and will not be favored nor penalized because of geographic adjacency to or distance from natural power resources. In making its charges the commission uses an "interim," or estimated annual rate. At the end of a fiscal year the municipality purchasing power is either credited or debited with the difference between the estimated rate and the actual cost of producing and delivering the power. The highest "interim" wholesale rates quoted in the 1920 annual report of the commission were between \$80 and

\$90 per horsepower year. The highest actual rates paid were between \$150 and \$160 per horsepower year. Nine municipalities paid a rate higher than the maximum rate quoted, which rate, says the report, generally is the one given for public information.

Further, in comparing costs of power to the people of Ontario with the costs of power received by the people of the States, in the Province of Quebec, the report says: "It is important to remember that Niagara Falls, combining its continuing flow of water with its high head, should make the production of continuous power the cheapest for any part of the American continent. This should be kept in mind especially when comparison is drawn for the California situation, where the hydroelectric power developments are small in capacity and are subject to variation in stream flow, thus requiring that their systems be supplemented with steam-electric plants"; also, that Ontario had only 35 per cent as many miles of transmission lines as California and that California transmissions served only 483 inhabitants per square mile, as against 587 inhabitants per square mile in Ontario.

Commenting upon this comparison, the report says that in the Niagara district of Canada the Government-owned electric utilities furnish power at an actual average cost of 9.25 mills per kilowatt-hour generated, while the private electric utilities of the same district furnish it at 7.6 mills per kilowatt-hour generated. The weighted average of these two is 8.78 mills per kilowatt-hour. Also, that in the United States for a comparable zone supplied by Niagara Falls power, the average price of power to the consumer is 7.65 mills per kilowatt-hour generated. The report does not contain data with regard to power costs in Alabama, but the comparable figure for power generated by Alabama Power Co. was 7.45 mills per kilowatt-hour.

"In the Province of Quebec, where power to the extent of 96 per cent is generated by private electric utilities and where the general zone of transmitted power is not unlike that of Ontario, the average cost to the consumer is 6.6 mills per kilowatt-hour generated."

The report further points out that existing contracts for the purchase of the Ontario Power Co. by the Hydro-Electric Power Commission included existing contracts to supply power to American and Canadian companies at 2.53 mills per kilowatt-hour generated, which results in Canadian municipalities of the Niagara system of the Hydro-Electric Power Commission paying 11.1 mills per kilowatt-hour, instead of the purchase price of 9.25 mills.

From these figures it is apparent, says the report, that both in Quebec and the United States the average price of power to the consumer is less per kilowatt hour when produced by private companies than when produced by Government-owned utilities. In the several considerations taxes have been deducted, but the price of power to the consumer in the case of the privately owned companies, whether in the Province of Quebec or in the United States, has included such profits or dividends as may have resulted from the conduct of their business.

"Whatever may have been the high salaries paid for executives, or whatever may have been the profits or dividends accruing in the conduct of the business affairs of the companies, it is manifestly plain that inclusive of these the price of power to the consumer has been less. This makes it very apparent that a far higher order of organization and administration exists in private than in governmentally owned electric utilities."

"The revenue per kilowatt hour generated for the American Niagara power district, which is comparable with the Ontario power district, is 17 per cent less than that from the total operations of the Hydroelectric Power Commission and the municipal commissions for wholesale power delivered in the Canadian Niagara district. It is about 13 per cent less than that for all the electric utilities in that district, whether governmentally or privately owned." In other words, the report says that the average cost of retail power to people residing within the municipalities served by the Hydroelectric Power Commission is 4.45 mills per kilowatt hour, or 40 per cent higher than the average cost of power to people in the American district. In addition the report points out that the American-Niagara district has a capacity 65 per cent in excess of that in Canada for each 1,000 population, thus maintaining a greater reserve against interruption of service and resulting in more efficient and more continuous service.

In spite of the higher costs of generation and less advantageous transmission and distribution conditions, privately owned companies in California are shown to serve the public at an average cost of power 4 per cent lower than the cost to the people served by Ontario systems other than the Niagara system. In

Quebec the report states that privately owned electric light and power companies serve the people of that Province at a cost 32 per cent, or approximately one-third less than the cost of similar service to residents of Ontario, and that the cost in Quebec is 27 per cent less than to even those consumers residing in the Canadian-Niagara district. In addition private companies in Quebec deliver 84 per cent more energy per capita than does the Hydroelectric Power Commission to its customers in Ontario, while the generating capacity available for Quebec is 89 per cent greater than that available upon the lines of the Hydroelectric Power Commission in Ontario.

In this connection the report states that "privately owned and operated companies in every case are delivering power to their customers at a considerably lower average cost per kilowatt hour than is the case for government electric utilities; that the number of kilowatt hours generated per capita served is greater and that the number of customers taking service for each 1,000 of population is greater; also that standing behind the privately owned service is a larger reserve equipment to insure continuity of service."

With respect to the question of taxation, the report cites the fact that all property held by the Government electric utilities in Ontario is tax free with the exception of taxes upon land, so that taxation in Ontario is insignificant in so far as it affects the cost of power, but by the presentation of statistics it is shown that this does not make for a reduction of the cost of power to the people, but merely amounts to a redistribution of an equal amount of money which is collected from all the people of the community instead of only from those using power. On the other hand, taxes received from the principal private companies in the Province of Ontario amount to 7.1 per cent of their annual incomes, and in the Province of Quebec, this tax is 6.53 per cent of the annual revenues, while in the Niagara district of the United States taxes amount to 10.6 per cent, and in California to 7.7 per cent of the annual revenues.

It is asserted in the report that the erection of the huge hydroelectric station at Queenstown below Niagara Falls, which, when completed, will be the largest in the world, is not to the economic interest of the people of Canada.

When the Queenstown plant was started, it was expected that power would be developed very cheaply because of the fact that the full drop of the water from Lake Erie to Lake Ontario would be utilized, thereby enabling the turbines in the Queenstown station to develop twice as much horsepower per cubic foot of water per second as is developed by the turbines of those stations located at Niagara Falls. In spite of this immense advantage the report states that because of the enormous cost of constructing the Chippewa-Queenstown system the Hydro-Electric Power Commission can not produce electricity there as cheaply as it is produced in the less efficient plants. The report shows that although the commission was able to purchase from the Ontario Power Co. 100,000 horsepower for \$9 per horsepower year, it will cost the commission \$31.10 to produce each horsepower year of electrical energy at the Chippewa-Queenstown development, and that even then there is some question whether under the existing international treaty, sufficient water is available to permit the use of all units eventually to be installed at Queenstown. Should this deficit of water power be found to be actual and not merely apparent, the cost per horsepower year will be materially increased.

Dominion Government statistics which are cited in the report show that the cost of power to the people of the Province of Quebec is less than that to the people of Ontario. The revenue per dollar of salary paid employees of electric light and power plants is almost 32.5 per cent greater in Quebec than in Ontario, and the revenue per employee earned by private electric companies in Ontario is 31.5 per cent greater than that earned from the government-owned utilities, whereas the revenue per employee earned in the Province of Quebec is 42 per cent greater than that for the governmentally-owned and operated properties of Ontario.

During 1920, states the report, the average cost of power delivered to consumers in Toronto from the local hydroelectric power system was 29 per cent greater than that to the people of Montreal, and 25 per cent greater than to the people of Buffalo. The increase in the average cost of electricity in the several cities, which was brought about by the increase in cost of labor and material since 1917, has been 25 per cent for Montreal, 27 per cent for Buffalo, and 44 per cent for Toronto. In connection with the operations of the Hydroelectric Power Commission and those of the municipalities in Ontario the capital addition in per cent of revenue, according to Mr. Murray, is greater by

200 per cent than that for the American companies in the Niagara district, and by 350 per cent than that for the Quebec companies.

Further detailed data contrasting American rates with those that obtain in Ontario shows, in the opinion of Messrs. Murray and Flood, that the rate structure of the Hydroelectric Power Commission is fundamentally wrong in that it functions only to specific points in the Provinces where power is available at minimum cost, and that the American method of equalizing rates throughout the area eliminates premium on location, brings about decentralization, and offers better opportunity for industrial expansion and for healthier inter-state and intrastate relations.

The report points out that the borrowing of the Hydroelectric Power Commission of Ontario, and the guaranties of the securities issued by the commission, form a large part of the Province's total liabilities, both direct and indirect. Approximately 70 per cent of the total liabilities of the Provincial Government of Ontario comprise investments for electric utilities. The investments made by the Hydroelectric Power Commission on behalf of the municipalities at the end of the fiscal year of 1920 totaled \$51,514,183. The investments made by the municipalities on their own behalf total \$26,172,894. The investments made by the Province total \$11,036,229. The investment of all the governmental agencies in electric utilities in the Province of Ontario at the end of the fiscal year of 1920 was \$121,232,011, or \$48 per capita, indicating to what extent both the provincial and municipal governments in Ontario are interested in the business of generating and distributing electricity, rather than with the direct functions of Government.

The CHAIRMAN. Let me ask you this: Is it true that on the Canadian side the development is made by municipalities instead of by corporations?

Mr. MARTIN. Partly. There the policy was to vary the rates with the distance of transmission. As the distance increases the rate increases. In the system which we operate in Alabama there is no difference in our rate at any point. In that way is equalized the advantages among communities. One community would have a great advantage over another in the matter of hydroelectric development if one community had one rate and another community had another rate.

The CHAIRMAN. You operate it like the postal system?

Mr. MARTIN. We are maintaining it on that system at present. Sooner or later, as we extend it hundreds of miles, possibly beyond the State, we can not, of course, maintain that basis. There is a limit to which that can be maintained.

The CHAIRMAN. A system of that kind can only be maintained, comparatively speaking, in a small radius?

Mr. MARTIN. The radius in which we operate is now about 25,000 square miles.

Senator HARRISON. Does the Public Utilities Commission of Alabama have jurisdiction over your rates?

Mr. MARTIN. Yes, sir.

Senator HARRISON. Have you had any controversies with them over your rates?

Mr. MARTIN. Well, we have had some. Every now and then we have controversies. That is what the commission exists for—to try to adjust the differences.

In response to a question asked by Senator Hefflin yesterday, I have obtained the lighting rates charged to the public by municipalities owning lighting systems in Alabama where power is furnished those municipalities for distribution by the Alabama Power Co.

In those five communities which I have mentioned the average rate they paid the Alabama Power Co. is 14 cents per kilowatt hour, and their rates per kilowatt hour are: Opelika, 12 cents; Lafayette, 15 cents; Piedmont, 15 cents; Auburn, 15 cents; Sylacauga, 13 cents.

The Alabama Power Co. supplies lighting service direct to the public in 36 cities and towns in Alabama. The highest lighting rate is 9 cents per kilowatt hour.

Senator HEFLIN. Why does Lafayette, 18 miles from Opelika, have to pay 3 cents more per kilowatt hour than Opelika?

Mr. MARTIN. Well, I can not tell you, Senator.

The CHAIRMAN. You are speaking, Senator, of the consumers located there?

Senator HEFLIN. Yes.

The CHAIRMAN. Of course, the municipality, I suppose, fixes the rate, and in one case it is 15 and in another one 13 and another 12.

Mr. MARTIN. Those municipalities own their own distribution systems.

Senator HEFLIN. I understand.

Mr. MARTIN. Opelika has a population of about 10,000.

The CHAIRMAN. They are paying 12 cents?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. And they buy from you at 1½ cents?

Mr. MARTIN. Not to exceed 1½ cents. Of course you must bear in mind these communities must maintain their systems, and they have a limited radius in which they distribute, and their consumers are limited.

The CHAIRMAN. Exactly, but in a town of 10,000 people the consumers will be limited only by the population unless they charge fabulous prices, which they seem to have done there. They may charge so much that they won't have any consumers.

Senator LADD. How long has Opelika been using power from your company?

Mr. MARTIN. About five or six years.

Senator HEFLIN. Lafayette has been using it for about two years?

Mr. MARTIN. No, sir; Lafayette only a few months. I obtained these rates by telegraph on yesterday in response to questions by the committee.

You understand, Senator, at Buffalo there is a steam plant erected a few years ago at a cost of \$10,000,000 in order to supplement the hydroelectric service. The hydroelectric power available has been absorbed entirely by industries which might be classed as private users of power. The question has become so serious in New York State that the governor, in his message to the legislature on January 24, 1922, made this recommendation:

"The State should grant licenses for the development of power for the general distribution, not for private use. With a general distribution assured, with the power to fix rates and to regulate service, capitalization, and secured debts of the licensee safeguarded, the maximum public benefit from the development of the potential water power within the State will unquestionably be secured through private enterprise."

That was the result of the experience of the grant of licenses for private use at Niagara Falls.

Senator HARRISON. Well, during the war it is my recollection we gave 4,400 cubic feet per second additional—I do not know how much horsepower—to be utilized as much as possible for war industries, so called. That is my recollection. There may be some controversy now that others should have the power except those war industries.

Mr. MARTIN. I would like to place in the record the following excerpt from the bulletin of the Alabama Manufacturers' Association of April 1, 1922:

"*Muscle Shoals*.—Does Ford's offer for Muscle Shoals contemplate a distribution of power throughout the State of Alabama, or does it contemplate the use exclusively in Ford's industrial interests, confining it to North Alabama? This State's development depends upon industry's ability to operate as cheaply as any other State, and in the distribution of power it is decidedly to the people's interests that it be distributed through the State and not confined to any one section."

Senator HEFLIN. Mr. Chairman, on yesterday Mr. Martin stated that they had expended at the Muscle Shoals Dam about \$500,000.

Congressman Wright, of Georgia, asked Mr. Martin this question:

"That property was acquired—that is, the site and the flowage rights—at an expense of about a half million dollars?"

"Mr. MARTIN. We had expended about a half million dollars on No. 2 site."

I have here a copy of a letter from the North Alabama Abstract Co., Tusculum, Ala., dated April 7, 1922, signed by O. B. Clark, general manager, in which he says:

"This report shows that for the lands and rights conveyed by said company to the United States, the original owners thereof receive from the company or those who bought on behalf of said company, the following amounts:"

Then he gives the amounts, and then says, "Total for all, \$23,501.50."

Now, I wanted to ask Mr. Martin what this other money was spent for. You said on yesterday, Mr. Martin, about \$500,000 was spent. This Abstract Co. says about \$23,501 was spent for land, etc., in Alabama.

Mr. MARTIN. I am aware, Senator, of the affidavit and statement to which you refer. It has been printed in the papers in an effort to discredit our company.

It is obviously made without any knowledge of many of the facts and conditions which exist.

This property was acquired over a period of years from 1906 on to possibly 1914. Prior to 1912 the project was owned by citizens of Alabama who, having acquired the lands, expended many thousands of dollars in their effort to develop the project, and you will find numerous reports on this table, numerous plans bearing date prior to 1912, and which have been put into the official records and surveys and plans made by the Muscle Shoals Hydroelectric Power Co. and which, of course, represent an expenditure of a great many thousands of dollars. Those owners sold their properties and interests in 1912 to Mr. James Mitchell and associates and received from Mr. Mitchell cash and securities representing not only the original cost of those lands but the expenditures, and doubtless some profit, which those people had incurred over a period of the preceding years.

Since 1912 the Muscle Shoals Hydroelectric Power Co. has, through its officers, principally Mr. J. W. Worthington, spent many years in Washington in an effort to obtain congressional authority for development of that project. It has incurred other expenses, has employed engineers, made plans, borings, investigations, and various expenditures, both prior to and since 1912, which represented on our books at the time of the donation of this property, in February, 1918, approximately \$476,000. It is, of course, obvious that an abstract company making a record from deeds filed of record had no access to records of this character, and it may also be true that deeds frequently cite one consideration when another is paid.

I think you will find \$1 stated in some of those deeds.

I can only answer the statement in that way.

Senator HEFLIN. You could not give us an itemized statement, then, covering the amounts that go to make up that amount of \$476,000?

Mr. MARTIN. I could only give it to you as I stated.

Senator LADD. Mr. Mitchell purchased those rights himself.

Mr. MARTIN. Yes, sir.

Senator LADD. What did he pay?

Mr. MARTIN. At that time my recollection is that the company had outstanding \$252,000 in common stock. Mr. Mitchell purchased that common stock by paying cash and assuming other obligations representing that amount of money in 1912.

Senator HEFLIN. Mr. Chairman, at this juncture, I would like this entire letter from the North Alabama Abstract Co. to appear in the record, also a schedule of purchases of lands and flowage rights, and, if the committee would like, here are the two copies of deeds from the Alabama Power Co. to the Government. You might include them.

The CHAIRMAN. All right. Just hand them to the reporter.

(The letter, schedule, and deeds referred to are as follows:)

NORTH ALABAMA ABSTRACT CO.,
Tusculum, Ala., April 7, 1922.

Hon. C. W. ASHCRAFT,
Florence, Ala.

DEAR SIR: Re lands and flowage rights conveyed by Muscle Shoals Hydro-Electric Power Co. to the United States.

Complying with your request, we have examined the records of Colbert, Lauderdale, and Lawrence Counties, Ala., and herewith report to you the number of conveyances, dates, amounts paid, and the rights conveyed to and from the Muscle Shoals Hydro-Electric Power Co. in connection with Wilson Dam.

First. Attached hereto are copies of two deeds from Muscle Shoals Hydro-Electric Power Co. to the United States, both dated July 28, 1920. One conveys certain parcels of land including or adjacent to the site of Wilson Dam. The other conveys the right to overflow several tracts of land above the said dam.

Second. Also attached hereto is a schedule of purchases by or for the Muscle Shoals Hydro-Electric Power Co., with dates and amounts paid, as stated in the deeds.

In the copies of the deeds from the company to the United States you will note we have placed numbers opposite each parcel of land or overflow right. Then in our schedule of purchases by or for the company we have numbered the items therein. This is for your convenience, and signifies that, for instance,

parcel No. 1, as numbered in margin of the deeds, was bought, as stated in remark No. 1 in our schedule of purchases.

This report shows that for the lands and rights conveyed by said company to the United States the original owners thereof received from the company or those who bought on behalf of said company the following amounts:

Colbert County:

Lands at dam site.....	\$3,972.50	
Flowage rights	1,555.00	
		\$5,527.50

Lauderdale County:

Lands at dam site.....	2,064.00	
Flowage rights	15,150.00	
		17,214.00

Lawrence County:

Flowage rights		760.00
----------------------	--	--------

Total for all..... 23,501.50

Yours truly,

O. B. CLARK, *General Manager.*

A SCHEDULE OF PURCHASES OF LANDS AND FLOWAGE RIGHTS.

Below are listed the conveyances to the Muscle Shoals Hydro-Electric Power Co., or those who bought on behalf of said company, covering lands at the site of Wilson Dam, in Colbert and Lauderdale Counties, Ala., and flowage rights above the dam site in Colbert, Lauderdale, and Lawrence Counties, Ala.

The numbers below refer to the numbers of description in the two deeds from said company to the United States, copies of which are attached hereto.

Lands at dam site:

Colbert County—

No. 1. Andrews, Malone, et al., 17.9 acres, Dec. 1, 1906.....	\$447.50
No. 1. E. C. Sadler, 29.9 acres, Sept. 11, 1906.....	775.00
No. 2. E. C. Sadler, ———, May 7, 1914.....	2,750.00

Total..... 3,972.50

Lauderdale County—

No. 3. A. D. Bellamy, 41.28 acres, Sept. 21, 1906.....	2,064.00
--	----------

Total..... 6,036.50

Flowage rights above dam:

Colbert County—

No. 1, Henry Gargis, Oct. 2, 1906.....	\$360.00
No. 2, J. P. Hennigan, Sept. 16, 1907.....	10.00
No. 3, B. H. Carter, Sept. 12, 1912.....	10.00
No. 4, Carter heirs, Nov. 30, 1912.....	375.00
No. 5, C. D. Carter, Sept. 13, 1912.....	350.00
No. 6, R. W. Hennigan, Sept. 23, 1912.....	400.00
No. 7, J. H. Brown, Sept. 20, 1907.....	50.00

Total for flowage in Colbert County..... 1,555.00

Lawrence County—

No. 8, Charles McDonald, May 28, 1908.....	130.00
No. 9, O. H. Bynum et al., Aug. 26, 1907.....	600.00
No. 10, O. H. Bynum et al., Sept. 28, 1907.....	30.00

Total for flowage in Lawrence County..... 760.00

Lauderdale County—

No. 11, Douglass & Jackson, May 7, 1914.....	150.00
No. 12, F. E. Jackson, May 1, 1915.....	15,000.00

Total in Lauderdale County..... 15,150.00

Total paid for in rights and lands in this deed..... 17,465.00

Total for lands and rights in both deeds..... 23,501.50

Know all men by these presents, That the Muscle Shoals Hydroelectric Power Co., a corporation organized and existing under the laws of the State of Ala-

bama, for and in consideration of the sum of one dollar (\$1.00) to it in hand paid by the United States of America, the receipt whereof is hereby acknowledged, does hereby give, grant, bargain, sell and convey unto the said United States of America the following lands situated in the Counties of Colbert and Lauderdale, State of Alabama,—

The lands situated in Colbert County being described as follows, to-wit:

No. 1. A part of fractional section eighteen, township three south, range ten west of Huntsville principal meridian, more particularly described as follows, to-wit: Beginning at the northeast corner of said fractional section eighteen; running thence south along the section line for a distance of eight hundred (800) feet to a point; running thence southwesterly in a straight line for a distance of twenty-seven hundred ninety-seven and eight-tenths (2797.8) feet to a point eight hundred (800) feet from the south bank of the Tennessee River at low water mark; running thence north for a distance of eight hundred (800) feet to the south bank of the Tennessee River at low water mark; running thence along the south bank of the Tennessee River at low water mark to the point of beginning; containing forty-seven and eight-tenths (47.8) acres, more or less.

No. 2. Also a strip or parcel of land situated, lying, and being in fractional section eighteen, township three south, range ten west of Huntsville principal meridian, described as follows, to wit: Beginning at the point of intersection of the section line between section thirteen, township three south, range eleven west, and section eighteen, township three south, range ten west, and the low-water mark of the Tennessee River; running thence south along the section line for a distance of six hundred and thirty (630) feet to a point; running thence in a northeasterly direction to a point on the half-section line, said point being six hundred and thirty (630) feet south of the point of intersection of the half-section line and the low-water mark of the Tennessee River; running thence north along the half-section line for a distance of six hundred and thirty (630) feet to the point of intersection of the half-section line with the low-water mark of the Tennessee River; running thence along the low-water line of the Tennessee River in a southwesterly direction to the point of beginning, subject to the agreement relative to the houses and fences of said tract contained in the deed of Elizabeth C. Sadler and husband, W. H. Sadler, to Wiley Alford, bearing date of May 7, 1914, and recorded in the office of the Judge of Probate of Colbert County, Alabama, in volume 16 of deeds, page 551, and as modified by the agreement between Elizabeth C. Sadler and husband, W. H. Sadler, to Wiley Alford, bearing date of May 7, 1914, and recorded in the office of the judge of probate of Colbert County, Alabama, in volume 16 of deeds, page 551, and as modified by the agreement between Elizabeth C. Sadler and husband, W. H. Sadler, and Wiley Alford, bearing date of May 12, 1914, and recorded in the office of the judge of probate of Colbert County, Alabama, in volume 16 of deeds, page 552.

And the lands situated in Lauderdale County being described as follows, to wit:

No. 3. Fractional northwest quarter of the southeast quarter of section seven, and the fractional northeast quarter of the southeast quarter of said section seven, township three south, range ten west of Huntsville principal meridian, lying north of Tennessee River, and containing forty-one and twenty-eight hundredths (41.28) acres, more or less.

To have and to hold the aforegranted premises, with all the rights, easements, and appurtenances thereunto belonging, to the said United States of America, its successors and assigns, forever.

In witness whereof the said grantor, Muscle Shoals Hydro-Electric Power Co., has caused this conveyance to be executed in its name and under its corporate seal by Thos. W. Martin, its president, and attested by Lamar Aldridge, its secretary, on this the 28th day of July, 1920.

[SEAL]

MUSCLE SHOALS HYDRO-ELECTRIC POWER CO.,
By THOS. W. MARTIN, *President*.

Attest:

LAMAR ALDRIDGE, *Secretary*.

STATE OF ALABAMA,
County of Jefferson:

I, W. R. Loyd, a notary public in and for said county, in said State, hereby certify that Thos. W. Martin, whose name as president of the Muscle Shoals Hydro-Electric Power Co., a corporation, is signed to the foregoing conveyance,

and who is known to me, acknowledged before me on this day that, being informed of the contents of said conveyence, he, as such officer, and with full authority, executed the same voluntarily for and as the act of said corporation. Given under my hand this 28th day of July, 1920.

[SEAL.]

W. R. LOYD,

Notary Public, Jefferson County, Alabama.

My commission expires June 21, 1921.

Know all men by these presents, That this indenture, made and entered into this the 28th day of July, 1920, by and between the Muscle Shoals Hydroelectric Power Co., a corporation organized and existing under the laws of the State of Alabama, party of the first part, and the United States of America, party of the second part.

Witnesseth:

That the said party of the first part, for and in consideration of the sum of one dollar (\$1.00), to it in hand paid by the party of the second part, the receipt whereof is hereby acknowledged, does hereby give, grant, bargain, sell, and convey under the said party of the second part, the United States of America, the perpetual right and easement to permanently overflow, by means of the construction, maintenance, and operation of the Wilson Dam across the Tennessee River, that part of the following-described lands in the counties of Colbert, Lawrence, and Lauderdale, State of Alabama, lying and being below the 505-foot contour, as referred to the precise level survey made by the United States engineers in 1895, as described in the report of the Chief of Engineers, United States Army, for the year ending June 30, 1896, and which 505-foot contour was actually staked out on the ground by the survey made by the United States engineers in 1919 under the direction of D. A. Watt, assistant engineer—

The lands lying and being in Colbert County, State of Alabama, being described as follows, to wit:

No. 1. All of the fractional southeast quarter of fractional section 6, township 3 south, range 9 west, of Huntsville principal meridian, lying south of Tennessee River.

No. 2. Also that certain strip or parcel of land lying along the south bank of the Tennessee River in fractional northwest quarter of northwest quarter of fractional section 8 and in fractional southwest quarter of southwest quarter of fractional section 5, township 3 south, range 9 west, of Huntsville principal meridian, which would be submerged if the level of the water of the Tennessee River should be raised to an elevation of sixty (60) feet above low-water mark.

No. 3. Also that certain strip or parcel of land lying along the south bank of the Tennessee River in the fractional east half of the northwest quarter of fractional section 8, township 3 south, range 9 west, of Huntsville principal meridian, which would be submerged if the level of the water of the Tennessee River should be raised to an elevation of sixty (60) feet above low-water mark.

No. 4. Also that certain strip or parcel of land lying along the south bank of the Tennessee River in fractional sections eight and nine, township three south, range nine west, of Huntsville principal meridian, which would be submerged if the level of the water of the Tennessee River should be raised to an elevation of sixty (60) feet above low-water mark. Said strip or parcel of land to include the entire frontage on the south bank of said river, lying and being in the following-described tract of land, to wit: Beginning at a point nine hundred seventy-three and five-tenths (973.5) feet west of the northeast corner of the southeast quarter of the southwest quarter of said fractional section nine; running thence north to the Tennessee River at low-water mark; running thence in a westerly direction along the south bank of the Tennessee River at low-water mark to the northeast corner of the lands claimed by and in possession of W. H. Gargis on the 30th day of November, 1918, in said fractional section eight; running thence south to the northern boundary of the southeast quarter of southeast quarter of said fractional section eight; running thence east to the point of beginning.

No. 5. Also that certain strip or parcel of land lying along the south bank of the Tennessee River in fractional northeast quarter and north half of southeast quarter of fractional section nine, township three south, range nine

west, of Huntsville principal meridian, which would be submerged if the level of the water of the Tennessee River should be raised to an elevation of sixty (60) feet above low-water mark.

No. 6. Also that certain strip or parcel of land lying along the south bank of the Tennessee River in fractional section ten, township three south, range nine west, of Huntsville principal meridian, which would be submerged if the level of the water of the Tennessee River should be raised to an elevation of fifty (50) feet above low-water mark. And also the entire fractional southwest quarter of southwest quarter of fractional section eleven, township three south, range nine west, of Huntsville principal meridian, containing four (4) acres, more or less. Also all right, title, and interest of the grantor in and to the islands or towheads in the Tennessee River north of and contiguous to the above-described tract of land in said fractional sections ten and eleven.

No. 7. Also that certain strip or parcel of land lying along the south bank of the Tennessee River in fractional northeast quarter of northwest quarter of fractional section fourteen, township three south, range nine west, of Huntsville principal meridian, which would be submerged if the level of the water of the Tennessee River should be raised to an elevation of sixty (60) feet above low-water mark. Said strip or parcel of land to include the entire frontage on the south bank of said river lying in said fractional northeast quarter of northwest quarter of fractional section fourteen.

The lands lying in Lawrence County being described as follows, to wit:

No. 8. That certain strip or parcel of land lying along the south bank of the Tennessee River in fractional west half of fractional section seventeen, in township three south, range eight west, of Huntsville principal meridian, which would be submerged if the level of the waters of the Tennessee River should be raised to an elevation of twenty-five (25) feet above the low-water mark of said river. Said strip including the entire frontage on the south bank of said river which lies along the said fractional west half of fractional section seventeen.

No. 9. And that certain strip or parcel of land lying along the south bank of the Tennessee River and more particularly described as follows: Beginning at the point where the north and south section line between sections fifteen and sixteen intersect the low-water line of the said river; running thence down stream with the said low-water line for a distance of twenty-five hundred (2500) feet to the point of beginning; running thence south parallel with the east section line of said section sixteen for a distance of four hundred and fifty (450) feet to a point; running thence at right angles west for a distance of twenty-three hundred (2300) feet to the mouth of Poplar Spring Branch; running thence up the south bank of the said Tennessee River, with the low-water line, to the point of beginning, said strip or parcel of land lying and being in the north half of fractional section sixteen, township three south, range eight west of Huntsville principal meridian.

No. 10. Also that certain strip or parcel of land lying along the south bank of the Tennessee River in fractional northeast quarter of fractional section sixteen, township three south, range eight west, which would be submerged if the level of the water of the Tennessee River should be raised to an elevation of sixty (60) feet above low-water mark, said strip or parcel of land to include the entire frontage on the south bank of said river lying in said fractional northeast quarter of section sixteen, township three south, range eight west of Huntsville principal meridian.

The lands lying in Lauderdale County being described as follows, to wit:

No. 11. A tract or parcel of land containing three (3) acres, more or less, more particularly described as follows: Beginning at the northeast corner of the northwest quarter of section three, township three south, range nine west of Huntsville principal meridian; running thence south four (4) degrees, forty-five (45) minutes east along the half section line to the north bank of Muscle Shoals Canal, being the southeast corner of the desired tract. From this point of beginning run north four (4) degrees, forty-five (45) minutes west for a distance of three hundred and fifty (350) feet to a point; running thence south eighty-five (85) degrees fifteen (15) minutes west for a distance of four hundred and eighteen (418) feet to a point; running thence south four (4) degrees forty-five (45) minutes east to a point at the north bank of Muscle Shoals Canal; running thence along the north bank of said canal in an easterly direction to the point of beginning.

No. 12. Also a tract or parcel of land described as follows: All of the southeast quarter of fractional section four, township three south, range eight west

of Huntsville principal meridian, except a part thereof containing three (3) acres, more or less, which was conveyed by F. E. Jackson to the United States of America by deed of date April 10, 1890, and also except a part thereof containing twenty (20) acres which was conveyed by said F. E. Jackson to the United States of America by deed of date September 3, 1891.

To have and to hold unto the party of the second part, the United States of America, its successors, and assigns, forever, together with the right to go upon the lands hereinbefore described from time to time as occasion may require and remove therefrom any timber and other natural growth and any obstructions, growths, accumulations, brush, trash, filth, and any other thing which in any way interferes with or tends to render inaccessible, unsafe, or unsanitary any part of the slack-water pool created by said dam, or the margin thereof, or any plant to be erected upon said lands, the granting or reserving the right, however, to remove the timber, minerals, buildings, and improvements therefrom and to use the said lands so far as may be done without interfering with the easement and rights hereby conveyed to the grantee.

In witness whereof, the said party of the first part, Muscle Shoals Hydro-Electric Power Co., has caused this conveyance to be executed in its name and under its corporate seal by Thos. W. Martin, its president, and attested by Lamar Aldridge, its secretary, on the day and year first above written.

MUSCLE SHOALS HYDRO-ELECTRIC POWER CO.,
By THOS. W. MARTIN, *President*.

Attest:
LAMAR-ALDRIDGE,
Secretary.

STATE OF ALABAMA,
County of Jefferson:

I, W. R. Loyd, a notary public in and for said county in said State, hereby certify that Thos. W. Martin, whose name as president of the Muscle Shoals Hydro-Electric Power Co., a corporation, is signed to the foregoing conveyance, and who is known to me, acknowledged before me on this day that, being informed of the contents of said conveyance, he, as such officer and with full authority, executed the same voluntarily for and as the act of said corporation.

Given under my hand and seal this 28th day of July, 1920.

W. R. LOYD,
Notary Public, Jefferson County, Ala.

My commission expires June 21, 1921.

Mr. MARTIN. May I see those?
Senator HEFLIN. Certainly.

Mr. MARTIN. Of course, in addition to what I have stated the company employed counsel, attorneys, in connection with this project at Muscle Shoals for many years, and there were abstracts of title and attorneys fees.

The CHAIRMAN. I think it ought to be said, probably, that if we were passing on the offer of this evidence in court, upon a technicality, it would probably be all ruled out. It does not go to the establishment of any point that is really at issue. But on the moral side of the question of the Alabama Power Co. in its intentions and dealings with the Government, it has a bearing, and I think we ought to put it all in.

Mr. MARTIN. On the question as to how far a statement of that kind is—

The CHAIRMAN. As to the question as to what we ought to do with Muscle Shoals, or whose proposition we ought to accept. I don't suppose, as a matter of law, it makes any difference how much it cost the Government to acquire the property that it got from the power company, or whether the power company gave them something for nothing, or whether they charged too much.

Mr. MARTIN. As a matter of fact, as I have stated, the power company received \$1 from the Government for the property, and the whole purpose of this, as I see it, is to cast doubt on the statement we make as to the amount of money we spent on that property.

The CHAIRMAN. The copies of the deeds and the other evidence offered by Senator Heflin are admissible to the same extent and in the same way that your evidence is as to what you expended on that property, that you turned over to the Government for \$1. You say it cost you \$500,000. Both offers are on the same basis exactly. We ought not to admit one without admitting the other.

Senator HEFLIN. Some Alabama citizens at Muscle Shoals have disputed the proposition that \$500,000 has been expended there. It is perfectly proper for Mr. Martin to contend that they have expended it, and they have the right to refute it, if they can.

The CHAIRMAN. If it were a material proposition I would want to go into it in detail, but, as I said before, I don't think it is a material proposition.

Mr. MARTIN. Mr. Chairman, we have, in this whole situation here, presented it with a view of showing that we have at all times endeavored to cooperate with the Government, beginning with the time the present owners came in touch with this matter, in 1912, and from then on down to the present time. We have endeavored to cooperate with the Government as far as we could in dealing with this question. Prior to that time it was in charge of local citizens entirely, of whom Mr. J. W. Worthington was one of the principals since 1912, and up to February, 1920, Mr. Worthington was the president of this Muscle Shoals Hydro-electric Power Co. until a little over two years ago. This entire history, first and last, has been with a desire on our part to fully cooperate in every movement that the Government desired in this matter, and there was no delay or hesitation in 1918, when the Senators from Alabama, Senator Bankhead and Senator Underwood, asked us to cooperate with the Government by developing property, which we agreed to do. That we expressed in our letter to the Chief of Engineers under date of May, 1921.

The CHAIRMAN. Is that all?

Mr. MARTIN. That is all, Mr. Chairman. I had one other witness who was coming here to-day, but he has not come, and I would like to have him appear in the morning.

(Whereupon at 11.40 a. m. the hearing was adjourned to 10.30 a. m. Thursday, April 20, 1922.)

MUSCLE SHOALS.

THURSDAY, APRIL 20, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224 Senate Office Building, Senator George W. Norris (chairman) presiding.

Present: Senators Norris, McNary, Gooding, Ladd, Norbeck, Kendrick, Heflin, and Caraway.

The CHAIRMAN. The committee will come to order.

STATEMENT OF FRANCIS E. FROTHINGHAM, VICE PRESIDENT OF COFFIN & BURR (INC.).

The CHAIRMAN. Where do you live, Mr. Frothingham?

Mr. FROTHINGHAM. My home is in Boston.

The CHAIRMAN. What is your business?

Mr. FROTHINGHAM. I am a member of the firm of Coffin & Burr, who are investment bankers. My firm, as have I individually, has had wide experience all over this country and in Canada in connection with public-utility enterprises.

Mr. Martin wanted me to come here this morning to review this proposition from my point of view, which I shall be very glad to do.

It is always my effort, in studying these problems, to get at the facts as best I can and to draw such conclusions as the facts seem to warrant. It is most important always, of course, that any judgment should be based not on prejudice or any misunderstanding of the facts, if that can be avoided.

In Alabama there are opportunities for hydroelectric development of a very unusual kind. The reason for that is determined by nature.

The Allegheny Mountain Range, which parallels our Atlantic coast, is the source of the water-power streams that flow east into the Atlantic and west into the Ohio River, and that must for all time be the only available source of hydroelectric power in this part of the country. That the Allegheny Mountains run out into the lowlands in Alabama establishes the fact that the water-powers around the southwestern flank of the mountains must be the water-powers available for a very extensive country to the southwest and the west. The reason that that is so is simply a fact of nature that I would like to call your attention to.

The ancient shore of the Atlantic Ocean was far inland from where it is at present. That shore followed a line which connects the headwaters of navigation of the various streams that flow into the Atlantic Ocean and the Gulf of Mexico. For instance, the Savannah River is navigable to Augusta. Augusta was the old shore line. Macon, the headwaters of the Altamaha, I think, is another point on that line. The line then continues into Alabama, to Montgomery. The Alabama River is navigable from Montgomery to the Gulf. Then it turns north and goes up through Tuscaloosa and on through this Muscle Shoals section of the Tennessee River. Then the ancient seacoast line swung to the north and west, crossed the Mississippi River and returned to the Gulf somewhere west of the Mississippi River. That means that the entire areas on the sea side of that whole line is without water capacities. There may be minor powers here and there, but they are entirely inconsequential in connection with the proposition we are considering here.

The CHAIRMAN. You mean in ancient times the Muscle Shoals was on the seashore?

Mr. FROTHINGHAM. Yes, sir.

The CHAIRMAN. And the Tennessee River emptied into the sea at Muscle Shoals?

Mr. FROTHINGHAM. At that point or thereabouts, Senator. That line swung around up north and came down west of the Mississippi. That means that the entire State of Mississippi, and the entire State of Louisiana, has no water power at all. Western Tennessee has no water power. Southeastern Arkansas has no water power. Eastern Texas has no water power. Oklahoma has very little water power. The only water power available in that territory is in northwestern Arkansas. That means that the water powers around the southwestern flank of the Allegheny Mountains are the only hydroelectric capacities which can send hydroelectric current into this entire area I have spoken of. If it is going to get hydroelectric power it must get it from these sources. There are, of course, as shown on the map there, large powers in Georgia and South Carolina, and on the other side of the mountains, in east Tennessee. But those capacities serve the localities to the north and northeast. To get into this territory I speak of they would have to cross over the capacities in northern Alabama.

The CHAIRMAN. In other words, these powers of which Muscle Shoals is a part are at least the nearest to this large area that has no water power?

Mr. FROTHINGHAM. They are the nearest.

The CHAIRMAN. That adds a great deal to the importance of the proposition?

Mr. FROTHINGHAM. Yes; naturally. Of course, hydroelectric power is more expensive as the distance to market increases. It is cheapest when the market is nearest the point of production. You want to ship it the least distance you can.

The CHAIRMAN. To follow that rule this is the natural supply for all that territory?

Mr. FROTHINGHAM. It is the natural supply. A radius of 300 miles from Birmingham includes New Orleans, Memphis, Little Rock, Ark., and Mobile. Memphis and Nashville are only 200 miles away. The entire State of Mississippi is practically within the 200-mile radius, and standard transmission practice to-day is 300 miles. In Southern California, I think, is the longest transmission we have now in the United States. Current is taken sometimes from the eastern side of the Sierra Mountains to Yuma, Ariz., about 470 miles. However, 300 miles is standard transmission practice, and that is being constantly extended. The result is, if we look at the map, that the cities of Mississippi—Vicksburg and the rest of them, New Orleans—any part of Mississippi or Louisiana, to get hydroelectric power, has got to reach out to these sources.

That means that it is of the utmost importance that these sources shall be so developed and coordinated as to give the maximum possible service. All of the history of hydroelectric experience has gone to show that hydroelectric capacities must be interconnected and interrelated in the most intimate possible way in order to get the greatest advantage from each one. The object of that is to take advantage of what is called the diversity factor. This can only be done by this coordination. By that I mean that the aggregate of all the power demands coming at a given time is less than the sum of maximum individual demands, so that you have not got to have so large an investment for power-producing capacity to take care of the aggregate momentary demands as you would have in taking care of them in an individual way. Thus coordination enables one capacity which has shortcomings, to be readily offset by other capacities which have particular advantages. It means that the distribution of current may be made by the shortest distance from the point of generation to the point of consumption, all of which means economies and the conservation of expenditure for distribution capacities to reach extended markets.

The war, during which emergency it was important to get immediately as much power as possible, taught us that the first thing to be done was to interconnect systems so that different hydroelectric capacities would play together and offset one another, so as to get the advantage of this diversity factor, and this surplus from—

The CHAIRMAN. I suppose it would be on the same principle as a bank which has deposits from a whole lot of people, on the theory that they will not all want it at the same time.

Mr. FROTHINGHAM. It is the same theory exactly. This diversity factor varies in different companies. In the case of southern California—Edison Co. in southern California—the connected load is two and one-half times the actual load that is put on the company. That is, if the connected load, adding up each separate customer, comes to 125,000 horsepower, a 50,000-horsepower station takes care of it.

In Alabama the load factor is slightly different. If the connected load is 100,000 horsepower, it will take 50,000-horsepower capacity to take care of it. If the investment was required to take care of each individual load separately, you would have to have an investment to make 100,000 horsepower.

It is to secure those economies that you need to have this intimate coordination. Particularly do I mention that because, as I see it, those points are not open to argument. They are matters of fact. If one does not allow for this coordination, if one does not build up a system which makes it possible with a minimum investment to get the maximum amount of current to the people of a territory, the only other physical way of supplying a given demand is to increase capacities; but, if you want to accomplish a given result most economically, those are the physical facts which control.

In Alabama there are three major power streams. One is the Tennessee, another is the Coosa, and another is the Tallapoosa River. Army engineers have collaborated with the engineers of the Alabama Power Co. for a great many years in studying the question of power development on the Tennessee River, with a view to taking advantage of its possibilities at Muscle Shoals. The Tennessee River is so flashy a stream—that is, its variations of stream flow from minimum to maximum are so great and so sudden—that it is a difficult river to control in order to get its full capacity into use. The minimum flow of the stream is about 7,000 second-feet. By second-feet I mean the number of cubic feet that flow by a given point in a second. The minimum flow of the river at Wilson Dam would produce 70,000 to 75,000 continuous horsepower. It can produce no more continuous horsepower. The average flow in a series of years will produce about 125,000 horsepower. That, again, is a physical fact that we must accept. In other words, the power that is available all the year around is only about 125,000 horsepower.

The question then comes how the Tennessee River can be supplemented in order that the power that is available less than all the time may be made available all the time. That can only be done by some sort of relay capacity, either steam to make good the times when the river is low, or water-power capacities from some other source.

Senator McNARY. Could that be tied to storage in other streams?

Mr. FROTHINGHAM. That I was going to say. Please do not hesitate to interrupt me at any moment to ask questions.

The Tallapoosa River and Coosa River are especially valuable for storage. It is the opinion of the Alabama Power Co.'s engineers, as well as of the Army engineers, that the most practical way of getting this relay power to help out the low flow periods of the Tennessee River is by the development of storage on the Tallapoosa and Coosa Rivers, and in connection with that storage and at other points hydroelectric capacities on those streams.

Senator McNARY. Where is the Tallapoosa River? Is it shown on this map here at all?

Mr. FROTHINGHAM. The Tallapoosa River is down in the eastern part of the State and flows into the Alabama River just north of Montgomery.

The CHAIRMAN. It is on the other side of what we call the divide. The waters of the Tallapoosa go into the Gulf of Mexico and not into the Tennessee?

Senator HEFLIN. The Tallapoosa and the Coosa Rivers make up the Alabama, 14 miles above Montgomery.

Senator McNARY. It is not a part of the watershed of the Tennessee River?

Mr. FROTHINGHAM. No, sir. In connection with hydroelectric development it is very important that wherever different watershed areas can be tied together they should be, because no two watersheds have the same characteristics of rainfall, run-off, and so on.

The CHAIRMAN. I can see how that would be important. When you would have low waters in the Tennessee watersheds you may have high waters in the other watersheds, so they could help each other there.

Mr. FROTHINGHAM. That is very well illustrated in the northern districts where streams derive their waters from the melting snows and the run-off comes later than on a stream farther south.

In the same way, take the Allegheny range. You may have in north-eastern Tennessee conditions which are altogether different from those down in Alabama. By tying them together you take advantage of that particular kind of diversity factor.

Now, it was decided by the Government engineers—I say decided, because it is embodied in a report made and presented to Congress for the development of Muscle Shoals by the Government engineers—that the best and most practical way of making the power available at Muscle Shoals to its maximum was to coordinate it with the resources of the Coosa and Tallapoosa Rivers. The distances are comparatively small. Muscle Shoals to Montgomery, if I am not mistaken, is about 175 miles, which is nothing for a transmission line. A radius from Birmingham, of the distance from Birmingham to Muscle Shoals, would include all these possibilities that I speak of. You would have within such a circle a possible hydroelectric installation of a million and a half horsepower. Of course, I do not mean power that is available all the time, because installations are not made in that way. The major public demand is for 12 hours. The other 12 hours the demands are much less. So that means installed capacities on what is called a 50 per cent load factor basis. Of an interconnected aggregate such as I have mentioned the Wilson Dam would be developed probably to 500,000 to 600,000 horsepower. That would mean that that development would give its capacity during certain periods of the year, and when it did not give them it would be supplemented by power from other watersheds.

This plan that I speak of does not involve regulation of the Tennessee River. On the Tennessee River itself there are various reservoir possibilities and dam sites. As those reservoirs are developed they would help the flow of the Tennessee River, and in so far as they do they would improve the situation at Muscle Shoals and help the whole situation, of course. But the opportunities in Alabama are so much nearer and can be coordinated so much more quickly that their effect would be secured a great deal sooner.

Senator McNARY. That would contemplate dams in these two rivers?

Mr. FROTHINGHAM. Oh, yes. The Alabama Power Co. has the dam sites and is prepared to go ahead and make these developments whenever the market justifies that step being taken. Those steps will be progressive.

Senator HEFLIN. You already have a dam on the Tallapoosa now, have you not?

Mr. FROTHINGHAM. Yes; down near Montgomery. I don't think that dam is owned by the Alabama Power Co.

The CHAIRMAN. They have a dam in the Coosa River.

Senator HEFLIN. There are two high dams in the Tallapoosa River.

Senator McNARY. Do you contemplate more than one dam and one storage site on those rivers?

Mr. FROTHINGHAM. Yes, sir. The Coosa River is susceptible of progressive development at several sites. The company now has a development at Lock No. 12 and is making one at Duncan Riffle, and below that there is still another one possible, and on the Tallapoosa River there are two or three, and some opportunities in the upper reaches of the Coosa River. But the idea is that they would be developed progressively.

Senator McNARY. Have you an estimate of the storage in acre-feet?

Mr. FROTHINGHAM. Not in acre-feet; but, as I remember it, the storage capacity on the Tallapoosa River is 50,000,000,000 cubic feet. It is one of the very large artificial reservoirs in the country. I don't remember the capacities on the Coosa River, but they are considerable. The reason why the Coosa River reservoirs are particularly valuable is that they would be upstream of the developments on the Coosa River, so that all the stored water would be used over the lower dams.

Senator GOODING. These reservoir sites that you speak of, do they cover a settlement?

Mr. FROTHINGHAM. I believe not. There are no vested interests there, no investments; and, as I understand it, the ordinary farm values for the most part would be very low. That is as I understand the situation.

Senator McNARY. On that point, have you made estimates of the cost of the construction of storage sites?

Mr. FROTHINGHAM. There have been estimates made of all of these storage sites, but I do not recall them. I have not for a long time gone into the details. As developments are made the unit aggregate cost of installation shows a downward curve. That is, every new development reduces the cost of the investment per unit of capacity; and it is the expectation of everyone,

of course, that as that process takes place it will be possible to give cheaper service.

The CHAIRMAN. The idea is that the improvement is to be made according to the demand for power.

Mr. FROTHINGHAM. Entirely so.

The CHAIRMAN. It would be a great many years before they would be required, and as they were developed the unit of power would be lessened in cost.

Mr. FROTHINGHAM. What I mean is this: That with 110,000 horsepower now installed at Lock No. 12, that represents a certain unit cost. For 220,000 horsepower the unit cost will be less than for 110,000 horsepower.

The CHAIRMAN. Yes.

Mr. FROTHINGHAM. As powers are developed it will mean a progressive lowering of the cost.

Senator GOODING. Your thought is that these water-power developments should be carried along together as nearly as possible, or should be considered together?

Mr. FROTHINGHAM. My thought is this, Senator, that if one is going to have in mind the manufacture of the largest amount of power at the minimum investment, that is the only way that it can be done. There are, of course, other factors; but if you are concerned with the question of producing the largest amount of power at the minimum cost, the highest quality of service that can reach the most extended area, I think there can be no dispute that this is the method; it is a matter of fact. That is the only way it can be accomplished. The Government engineers were so sure that that is so that before the war a plan was presented to Congress to develop Muscle Shoals—

Senator GOODING. This does not take into consideration, if we should go on with this greater development, you would not need the steam plants?

Mr. FROTHINGHAM. You would have to have some steam plants. There are no hydroelectric situations, with one or two exceptions, in the entire country that can be properly balanced without the support of steam-station relay. That is because you reach a time when it is economically less expensive to have a steam station to operate, whose investment cost is relatively low, so that while it stands idle interest will not eat you up, though when it operates it operates at a higher operating cost, than to have a high investment in hydroelectric plant stand idle, even though when it is run it is run at a lower cost of operation, lower cost per kilowatt hour. So that there is always an economic balance where you want a steam station to turn in in connection with hydroelectric capacities.

The CHAIRMAN. As I understand it, there never can be a development of power that steam would not help unless it was something like Niagara—absolutely the same the year around? Wherever you have a variation in the maximum and minimum flow you can help the situation by having a steam auxiliary plant?

Mr. FROTHINGHAM. Very materially. But don't let us even except Niagara. The reason we do not need steam to supplement Niagara now is that we are using only a part of its capacity. But suppose the wind blows from the east very hard—we will say for a week; it piles a lot of water in Lake Erie in the western end of it, and the flow of the Niagara River is lowered very much. Suppose you have a gale from the west. It blows the water of the lake nearer to the outlet, and the flow of the river goes up. So that you have got in the Niagara River considerable fluctuation, depending upon natural conditions. Furthermore, you may have an ice jam on the Niagara River that will make variations. So that if you were using the capacities of the Niagara River anywhere near their limit a steam plant should take care of that variation there. The only time, if I may digress a little—and pray do not let me say a word more or occupy your time an instant longer than you wish.

The CHAIRMAN. I think this is very interesting, myself.

Mr. FROTHINGHAM. The only time you do not need steam is when you are able to control the stream flow at a given point 100 per cent. Let me illustrate by taking the Bear River, out in Utah, north of Salt Lake City.

Senator GOODING. Out in Idaho. Bear Lake and Bear River are in Idaho.

Mr. FROTHINGHAM. Bear Lake is out in Idaho and Utah. Bear River flows into Bear Lake and Bear Lake is of such a size that it can take the entire flow of the Bear River, no matter how it comes, no matter what the floods are. The entire river is drawn into Bear Lake and held there, and can be let out of Bear Lake whenever you want it, and Bear Lake is of such size that it can hold the flow of Bear River for three or four years.

The CHAIRMAN. That forms a reservoir site, then?

Mr. FROTHINGHAM. It forms a reservoir site. The result is you can hold the water in Bear Lake and let it out just exactly as you want it.

Those are not conditions which obtain here, or which can ever obtain here. The idea is to approximate them as clearly as possible, and that approximation is accomplished by intimate coordination. I can not repeat that too often, because it is so eternally true. The opportunities of coordination in Alabama are so much nearer, physically, and in time, as against what the upper reaches of the Tennessee River can accomplish, even when it is done, that it is, in the judgment of all the men who have studied it, the way to take advantage of the opportunity.

I believe if all these dams on the upper Tennessee River were made and this storage created, it would approximately double, for a period of about 90 days, the average low flow of the Tennessee River.

Senator KENDRICK. Do you believe that water could be stored in reservoirs at an expense that would justify the outlay?

Mr. FROTHINGHAM. There is no question about that, Senator. The studies which have been made all go to show that as these developments are progressively made the unit cost of production and distribution goes down, so that the more you do the cheaper you get your aggregate. Of course those are human estimates, and human judgment is fallable, but that is what the best study shows, that there is a progressive decrease in the aggregate cost of production and distribution.

Senator KENDRICK. The question was inspired by the impression I gained down in Muscle Shoals there, from our engineers, that while the water could be reservoired, it was questionable whether the benefit to be derived would justify the expense.

Mr. FROTHINGHAM. Whether the benefits would justify the expense, sir, depends altogether on whether or not they are made to meet a demand. If they are made in excess of the demand, of course they will not, but if the demand is there they will. That is one reason why nothing has been done on Muscle Shoals during all these years, because so large an initial investment was necessary before you could get your first bit of output, and unless you developed your market and developed the business to absorb the capacity of the Tennessee River, you would be economically unsound in going ahead.

For instance, take the Wilson Dam. You have to build the whole dam before you can get 5,000 kilowatts out of your power plant. Suppose your load is only 50,000 horsepower. You simply can not carry that cost. But now, when you have the business that has been built up by the Alabama Power Co., which has a demand at the present time for 170,000 horsepower, and by the time Wilson Dam could be completed, within three years, a demand sufficient to carry its cost, then you are justified in talking about development. And we have reached that time, in my opinion.

The plan which was made to Congress before the war involved the idea that the Government would pay the cost of development and the company would repay that cost over a period of years, in agreed upon amounts. The Government stands permanently the portion of the cost that applied to navigation, and the company the portion of the cost that applied to hydroelectric development. We had to go to Congress because there was at that time no water power bill. If the matter were up for discussion now, without complication by any work done during the war, this development of the whole Muscle Shoals situation would, as a matter of routine, be before the Water Power Commission and would be passed upon by the Water Power Commission after hearing, within the limitations of that bill. But as the result of the oncoming of the war, for emergency war purposes, it became necessary to do the work which was done there as rapidly as possible, and the Alabama Power Co. turned over to the Government its work and investigations, on which it had spent close to \$500,000 at the Wilson Dam, for a mere dollar, because it wished to help the war situation, and the Government went ahead with it under special war legislation.

Now, I take it that we are not concerned with the special war legislation, because we have to have now special legislation to untangle the situation. The problem is rather what is the fundamental concern of the Government in this Muscle Shoals proposition and how can it best serve the aggregate need.

Now, as I see that, the Government is first concerned with power for the manufacture of explosives for its nitrate plant in time of war; second, if it should come to the conclusion that in time of peace it wants to use the nitrate

plant to manufacture fertilizer, it wants to be sure there is power available for the manufacture of fertilizer.

Over and above those two demands, I take it, the concern of the Government is that the remainder of the power there potentially available shall be put to the greatest possible use of the greatest number of people; that is, that it shall be coordinated in the way that I have spoken of, so that it can reach Nashville, Memphis, Mobile, the cities of Mississippi, New Orleans, and supply the demand for electrical power in those centers. The question is what agency is the best agency to do that. To me it is clear that the Government ought not to undertake it. Our whole country has been built up by private initiative, and the time has not yet come when we can set aside the great advantages that can be gained from private initiative. But when private initiative reaches into the public service then I do not believe we can trust human nature enough to let it go on about its business without public control. And it is in that way that the supervision of these public services by commissions has been brought about, so that public services are entirely under the control of Government jurisdiction, a jurisdiction created by the people.

I am getting away from my point, but let me continue on for a moment.

Senator GOODING. That is a good point. Just develop it a little more.

Mr. FROTHINGHAM. If the Alabama Power Co.—and I mention the Alabama Power Co., which has had long technical experience in its field, it has got 1,500 miles of transmission line in northern Alabama, it has got distributing systems, it is serving some 750,000 people. It is reaching out to communities that had no current at all, and it gives to each one of those, as a result, not only power, but 24-hour power, so that if a small community has any natural advantages because of labor conditions or railroad facilities or anything of that nature, it can advertise cheap power, it can attract industry. It is only through the reaching out of such a system that farmers can have electric current to perform various farm services, like chopping corn for the silo, substituting electricity for the dangerous oil lamps in house and barn, thus lessening the menace from fire, for pumping water, and various services. It is only the big coordinated system which can reach out its tentacles in this way and reach everybody even at long distance. You can not do it otherwise.

The fear is that if you have the Alabama Power Co. or any other private agency perform such service, you are building up a monopoly against the public interest. Now, I think that is an entirely distorted point of view. When we think of monopoly we ordinarily think of some manufacturing concern that through various influences is able to exclude everybody else from manufacturing a particular product, and that can fix prices on its product at whatever the traffic will bear, and thus inflict injury on the public.

In the case of a public utility everything is reversed. A public utility is under public regulation. The Alabama Power Co. is either under the regulation of the utilities commission of Alabama or of Congress or of the Federal Water Power Commission. There is no twilight zone between those different controls. It is either under one or under the other. Whichever one it is under it is allowed to earn only a fair return—that fair return to be determined by the governmental jurisdiction—on the amount of money which has been expended in the public service, that amount to be determined by the public jurisdiction. That return anybody is entitled to. The result is not that the Alabama Power Co. is creating a monopoly against the public interest, but that the public is creating a monopoly in its own interest and for its own needs, determining only what agency shall perform that service for it; and if it allows the Alabama Power Co. to be the agency to do it, it takes advantage of private initiative and private energy, which, as I say, is at the background of the growth of this country. It takes advantage of that in its own interest, because it says how much money that private agency can earn.

Senator McNARY. Would not that apply to all privately owned and operated utility plants, and is not that the situation that exists in every State in the Union?

Mr. FROTHINGHAM. It is. Not in every State, but in most of them. It is something that applies to public utility operations. I am distinguishing carefully between public utility operations, regulated, and the unregulated private operations.

Senator McNARY. They are all doing a public service and are all regulated?

Mr. FROTHINGHAM. So far as public services are concerned; yes, sir.

Senator McNARY. So it does not matter whether it is the Alabama Power Co. or Ford who operates the plant; it would all be subject to governmental regulation or State regulation?

Mr. FROTHINGHAM. But Mr. Ford has not put forward a proposition which would be subject to any regulation at all. Mr. Ford has put forward a proposal which would take these opportunities at Muscle Shoals and segregate them for private use for manufacturing purposes, not as a public utility, but as an unregulated private enterprise; and under those circumstances it is impossible that the potentialities of that situation can be coordinated in the way that I have spoken of, and put to the use that I have mentioned.

Senator McNARY. You are going upon the assumption that the contract would carry out the provisions for the manufacture of nitrates, and use as a fertilizer plant, except in time of war, and the balance of the power would be devoted to the manufacture of automobiles, or some private industry?

Mr. FROTHINGHAM. Whatever you choose, but unregulated.

Senator McNARY. That could not be regulated, of course.

Mr. FROTHINGHAM. It is unregulated. If a public utility makes the development and serves its customers, it must give service to all at nondiscriminatory prices, as Secretary Weeks has pointed out.

Senator McNARY. Oh, yes.

Mr. FROTHINGHAM. That is the great difference between those two propositions.

Now, I will just speak of one other point, sir, and I think I am done, except for such questions as you may want to ask.

Referring to th's fundamental concern of the Government, first, the Alabama Power Co. offers to finish Willson Dam at its own cost. It does not call upon the Government for any further expenditure. If that is done, under the Federal water power bill it accepts a 50-year license, with all the regulations of the bill. That is, the Federal Water Power Commission may require additional installations to be made. It is all under the control of the commission. Its rates are made to produce a return on the investment determined by the Public Service Commission of Alabama.

The company offers to give the second 100,000 horsepower available from the Willson Dam to the Government free. The records show that the stream flow of the river is such that this 100,000 horsepower is available 82 per cent of the time.

Senator GOODING. How much?

Mr. FROTHINGHAM. Eighty-two per cent. That percentage, sir, is worked out by taking the Government records of stream flow which have been kept for a good many years.

Senator NORBECK. That allows enough water to go over the dam during low-water periods to maintain navigation, does it not?

Mr. FROTHINGHAM. The navigation is completely taken care of in all of these plans, as I understand it. There is no question there.

Senator KENDRICK. As I understand it, that 100,000 horsepower for 82 per cent of the time means an average, so that it would amount to more than that at one time and less at another, averaging 82 per cent of the time 100,000 horsepower.

Mr. FROTHINGHAM. The second 100,000 horsepower at the Wilson Dam, if you have full stream flow, would be available all of the time. The records show, over the past 40 years, I think, that it would be available on an average 82 per cent of the time.

Senator GOODING. The second 100,000 horsepower?

Mr. FROTHINGHAM. Yes, sir.

Senator NORBECK. What is the lowest it would be in any one year?

Mr. FROTHINGHAM. Well, I have told you that the minimum flow of the river as recorded is 75,000 horsepower. So that on the minimum stream flow of the river it may not be there at all.

Senator NORBECK. But if you take the average of 40 years, it will average 80 per cent?

Mr. FROTHINGHAM. I will not say it is just 40 years.

The CHAIRMAN. I think it is 50 years.

Senator NORBECK. In some particular years it might give power for 100 per cent of the time?

Mr. FROTHINGHAM. Yes, sir.

Senator NORBECK. That is the maximum. What is the poorest year in the 40? How many days in the poorest year would it give 100,000 horsepower?

Mr. FROTHINGHAM. I can not tell you.

The CHAIRMAN. There would not be any year that they would be without power, but there would be days in the year when the Government, getting the second 100,000 horsepower, would not have anything.

Senator NORBECK. Might it not be a period of six months during some bad year?

The CHAIRMAN. Oh, no; not unless the records are different from what the 50 years measurements show.

Mr. FROTHINGHAM. The records do not show it.

The CHAIRMAN. There would be times that the person getting the first 100,000 would not get his full power and there would be some days that he would get more. I think on the average of 50 years, as I remember the testimony, there would be a day and a half in the year when there would be less than 87,000 horsepower. Is that right, Major Burns?

Major BURNS. Yes, sir.

The CHAIRMAN. On an average, based on gauge reading for 50 years, there would be a day and a half each year when the power development at that plant would be less than 87,000 horsepower.

Mr. FROTHINGHAM. Those are matters, of course, of estimate based on figures that are available.

The CHAIRMAN. What did you say would be the maximum production in horsepower at the Muscle Shoals Dam?

Mr. FROTHINGHAM. I do not think I stated it in that way. I said that if the Muscle Shoals Dam were built and coordinated with other available hydro-electric powers, that there would be installed, when you got it finally completed, perhaps—

The CHAIRMAN (interposing). Let me, for the benefit of the Senators who were not here when this testimony was given—

Senator HEFLIN (interposing). I would like to get this on the record, Mr. Chairman. That dam alone. How much horsepower would be produced at the Muscle Shoals Dam?

Mr. FROTHINGHAM. You mean standing alone, not coordinated with anything?

Senator HEFLIN. Yes, sir.

Mr. FROTHINGHAM. If that dam is built and completed as the river stands to-day the average minimum flow of the stream will produce about 125,000 continuous horsepower. If that power is used during 12 hours a day instead of 24 it would be 250,000 horsepower. That is what the river on the average low flow will do alone.

The CHAIRMAN. There are so many members of the committee here to-day that I think it would be well to call your attention to an extract from Colonel Barden's testimony right on this point of the development of power at the Wilson Dam.

These figures are based on accurate gauge readings covering 50 years:

Eighty-seven thousand three hundred horsepower available 99.4 per cent of the time; 100,000 horsepower would be available slightly more than 97 per cent of the time.

At lowest accurate gauge readings on the Florence gauge 71,900 horsepower would be developed, which is absolute primary. That would be, as I understand it, 100 per cent of the time—all the time.

Senator KENDRICK. That is the smallest flow of the river known in 50 years.

The CHAIRMAN. Yes.

Maximum installation contemplated at flood tide, 624,000 horsepower. Maximum would be greater by installation of additional machinery. One million one hundred and six thousand horsepower would be available 7 per cent of the time. Of course, as he says here, that is not commercially valuable.

Mr. FROTHINGHAM. Referring to the terms of the offer of the Alabama Power Co., the company would finish this dam under the water power bill, provide this second 100,000 horsepower, and the Government would be left with the ownership of the nitrate plant and quarry and with this 100,000 horsepower available 82 per cent of the time, with which to do as it sees fit.

Senator KENDRICK. May I ask a question?

I want to ask if the Government proposes to operate this nitrate plant, would it be good judgment and wisdom on the part of the Government to maintain

the steam plant at the dam in order to reinforce this 100,000 secondary power at the dam?

Mr. FROTHINGHAM. My judgment would be no, for this reason, that if the Government retains the plant, the steam plant would stand idle this average of 82 per cent of the time.

Senator KENDRICK. It would not necessarily be idle. Could it not be leased to the Alabama Power Co.?

Mr. FROTHINGHAM. It probably could be, but if the Government is going to do that, why is it not better to let the Alabama Power Co. take the thing and operate it and coordinate it with its resources, and the Government not be responsible for the investment in it, or in any care or keep or maintenance of it, or any concern with it at all, but with it there available as a source of power for the Government when the Government wanted it this 18 per cent of the time, or for any other purposes. Not only that, but—

Senator KENDRICK (interposing). Just one more question.

Is it palpably certain that the Government, in operating the nitrate plant, would want to employ the steam plant only 18 per cent of the time?

Mr. FROTHINGHAM. I mentioned the 18 as the difference between 100 and 82. The stream flow records show that the water power would be available 82 per cent of the time. That being so, the steam plant would be needed only the other 18 per cent of the time.

Senator McNARY. Is the 100,000 horsepower which is available 82 per cent of the time sufficient in capacity to produce 110,000 tons of nitrate of ammonia, as provided in the Ford offer?

Mr. FROTHINGHAM. Now we are getting on a subject that I do not profess to know much about. From my personal information I have no knowledge. I have understood, from what I have heard from others, that the power required to run nitrate plant No. 2 was from 90,000 to 100,000 horsepower. I have also understood that as a fertilizer proposition the product which the plant is now equipped to manufacture is not well adapted to fertilizer manufacture; that it is a dangerous material; that to manufacture fertilizer at this nitrate plant it would be necessary to make some additional expenditures at certain stages to change it to produce a fertilizer, I think, known as sulphate of ammonia.

The CHAIRMAN. I think it is conceded that the nitrate plant, to make fertilizer, would need additional machinery.

Mr. FROTHINGHAM. Yes, sir.

The CHAIRMAN. The process is the same whether you are going to make fertilizer or explosives, up to a certain point. When you get to that point, to make fertilizer, it branches off in another direction, and no machinery from that point on is provided. Is that right, Major Burns?

Major BURNS. That is right.

The CHAIRMAN. I would like, if you will permit me, to interrupt you there to ask Major Burns is this a dangerous proposition? Is there any danger in the operation of nitrate plant No. 2 for making fertilizer?

Major BURNS. Not in my judgment; no sir. When you get ammonia nitrate you have an explosive, and that has to be treated with proper care, when you come to make fertilizer. There is not much danger involved.

Mr. FROTHINGHAM. I was speaking about the product that the plant is now equipped to manufacture. The reason I spoke of that was that in Germany they make this same ammonium nitrate which the nitrate plant No. 2 makes. The farmer will not buy fertilizer till the demand presses him. In Opau, Germany, they manufactured this ammonium nitrate in large quantity. Ammonium nitrate has the property—it deliquesces, I think—when it is stored it hardens. When at Opau they came to remove this material they found it too hard to remove in the ordinary ways, and they finally resorted to an explosive method of breaking it up in order to ship it. They used some sort of explosive—don't know what—and they made some 16,000 explosions in it to break it up, preparatory to shipment. After making some 16,000 explosions, one explosion set the whole thing off.

Senator GOODING. That was a short time ago?

Mr. FROTHINGHAM. A short time ago in Opau, Germany. Major Burns will check me up, I am sure. I am speaking from hearsay. I understood that that was the same material which nitrate plant No. 2 is now designed to produce.

The CHAIRMAN. I think that is correct. I don't think Major Burns would give a report of the German explosion just exactly as you do, but it is true, as I got it from Major Burns, that some misfortune of that kind occurred over in Germany, as you say. We might ask Major Burns about it.

Major BURNS. What Mr. Forthingham has said is exactly correct, that they were making fertilizer of ammonium nitrate and ammonium sulphate. They thought it was perfectly safe, and it is perfectly safe if you do not get the percentage of ammonium nitrate in the mixture too great—not in excess of 50 per cent. It so happened that in the course of their operations there was a concentration of the percentage of ammonium nitrate so that it got up to above 50 per cent, perhaps up to 60 or 70 per cent. Then when they exploded it, in order to break it down into small lumps and get it to the market, one of the charges of powder was put into this concentrated ammonium nitrate, and that went off as an explosion and set the whole mass off, causing a terrific explosion and destroying a great deal of property.

The CHAIRMAN. As I have understood heretofore in talking this same thing over with you, Major, you expressed the opinion that there was not any danger of such a thing occurring here at Muscle Shoals, and there was no use of it occurring if they used proper care.

Major BURNS. No, sir; I don't think so. Of course, when you are dealing with explosives you are very apt always to have trouble. If you treat them with proper respect you do not have any trouble. As I said before, if you are making ammonium nitrate you have something you have to handle with proper care.

The CHAIRMAN. Do you think in this plant down here, if we were going to make fertilizer out of that material, such a thing would be liable to occur?

Major BURNS. There would be nobody in America who would ever think of placing a charge of explosive in ammonium nitrate in order to get it into small particles to make it easily handled.

The CHAIRMAN. The point I am trying to get at, Major, is: If people would use ordinary care, is there any use of such a thing happening?

Major BURNS. I don't think so.

The CHAIRMAN. You can commit suicide, but it is not necessary to do it. A man can take poison, but he ought not to take it, and if he has good sense he won't do it.

Senator GOODING. Mr. Chairman, these human mistakes have always been made, and won't we continue to make them?

Mr. FROTHINGHAM. Ammonium nitrate is a dangerous ingredient. But what I was trying to point out was that the Government would then have its nitrate plants, have 100,000 horsepower for the production of explosives, and in addition to that it would have been instrumental in creating this great coordinated agency which I speak of, which in time of war it could absolutely use as it wants to for its own purposes.

When you come to the question of peace and the demand for fertilizers, it seems to me that the Government has rightly taken the position that if fertilizer can be manufactured profitably at this nitrate plant No. 2, Muscle Shoals should be available as a power-producing medium for it. The Alabama Power Co.'s proposition gives this 100,000 horsepower for the manufacture of fertilizer, so that the Government may either manufacture fertilizer itself, having this free power, or license the plant, or sell it with this free power to whomever it chooses, under whatever conditions or provisions it wants to provide, so that this plant is provided with power at no cost to operate for the manufacture of fertilizer. Thus, if anyone wants to manufacture fertilizer there for the benefit of the public, the farmers at large, they have the free power, and they can make such arrangements with the Government as the Government wants to make.

Then, lastly, with regard to the surplus potentiality, under coordination and development by some single agency, and I personally think the Alabama Power Co. is the agency, because it is there in the territory, knows the business, has studied it all these years, there will be made available as no other method can make them available the potentialities at Muscle Shoals to meet the increasing demands for current and power in all this region that I have spoken of.

I think, perhaps, some of these gentlemen were not here when I told you, Mr. Chairman, and may I repeat very briefly, that the ancient shore line of the Atlantic Ocean was way inland from where it is, and that determines physical conditions forever, so far as we humans are concerned. That ancient shore line is where these streams that flow off the Allegheny Mountains fall into the navigable regions of the rivers. That line goes through Columbia, S. C.; Augusta, Ga.; Macon, Ga.; Montgomery, Ala.; swings north through Tuscaloosa, through this Muscle Shoals region; then north and west across the Mississippi, down to the Gulf, way west of the Mississippi River. That means that for all time the

southern part of Alabama, the entire State of Mississippi, the entire State of Louisiana, western Tennessee, the eastern part of Texas, the southeastern part of Arkansas, can have no hydroelectric power which does not come from this direction, and if you are going to make hydroelectric power in this region for Mobile, Memphis, Nashville, only 200 miles away, New Orleans and Little Rock 300 miles away, for all these communities, it has got to come from this source, and the Government, if it is going to be guided by the underlying need of the greatest number of people, will see to it that this great opportunity is coordinated most intimately with other opportunities in that region.

The CHAIRMAN. Your objection, as I take it, to the Ford offer, is that it does not present the possibility of coordination. Suppose Mr. Ford constructed a big plant somewhere in the vicinity of Muscle Shoals, and he wanted more power, could he not become one of the customers of the Alabama Power Co., or, if he had some power, could he not sell it to the Alabama Power Co., or could he not connect up his power plant with the distributing system of the Alabama Power Co., and thus coordinate it all?

Mr. FROTHINGHAM. That can be done, Mr. Chairman, but it has this very material drawback, that the operation as proposed by Mr. Ford is an unregulated operation. There is no supervision over the money he spends, the way he constructs, the way he develops his power. If he has power to sell he is not going to become a public utility, because he does not want to become subject to public regulation.

The CHAIRMAN. Would he not have to if he sold electricity?

Mr. FROTHINGHAM. No; as a private manufacturer he can make power and sell it—

The CHAIRMAN (interposing). For his own use, but could he manufacture it and sell it without coming under the jurisdiction of the Alabama Commission?

Mr. FROTHINGHAM. He could sell it to a private consumer, just as he may sell the product of his manufacturing plant.

The CHAIRMAN. Would it not be more profitable, and could he not get more money out of it for himself, if he hooked it up with the Alabama Power Co., if he sold it to them, because use by a private consumer would be subject to all the objections which you have made to existing conditions, without coordination.

Mr. FROTHINGHAM. He would undoubtedly try to sell his power. He would try to sell it to the Alabama Power Co. or sell it to such other customers as he could get without becoming a public utility and coming under regulation.

But I would like to point out there that while you can get coordination to an extent, you get it only to an extent, because it never yet has been possible for two parties to make a contract together so that each party is not interpreting that contract to protect his own side of it, and the possibility of complete coordination is not there. Suppose some question comes up that an additional amount of power is wanted. One party to the contract says, "You make the investment and I will buy the product." The other party says, "No; I don't like that arrangement. It is more logical that you make the investment and I buy the product." There is a dispute, and you fall between the two and the thing is not done in a way to achieve the maximum result with the least investment.

Now, Mr. Chairman—

Senator CARAWAY (interposing). Before you leave that statement, you made a statement a moment ago about the sources of power for this territory. Were you aware of the fact that available water-power sites in Arkansas alone would supply the territory around Memphis and in Mississippi? That is 50 to 100 miles nearer to it than this development.

Mr. FROTHINGHAM. I had never heard of that, and I should be very much surprised if it is so.

Senator CARAWAY. Some of the dams are being constructed now. The first permit under the water power bill was issued for construction of power dam on the White River, and the borings for the dam are completed, and the dam on the Red River is half completed. That will reach Memphis within 50 miles.

Mr. FROTHINGHAM. The drainage areas of any of the streams up in that part of the country, where there is a difference of level and fall are so comparatively small—

Senator CARAWAY. You are mistaken, because I have been all over it.

Mr. FROTHINGHAM. There is not that amount of power there, sir. I believe it is not possible that there should be so much power in that region, and I have studied it with some care.

Senator CARAWAY. You are just mistaken, sir.

Mr. FROTHINGHAM. All right.

Senator HEFLIN. Mr. Chairman, before we get away from that, I do not think the witness is correct in his statement that if Mr. Ford should sell power for the purpose of operating machinery or for lighting up homes in the cities he would not be subject to the rules and regulations of the commission in our State. It would be covered under that law; there is no question about that. He could not sell in competition with the Alabama Power Co. and the Alabama Power Co. be subject to the rules and regulations and Mr. Ford not.

Mr. FROTHINGHAM. Mr. Chairman, I think the Senator misunderstood me. You may recall that I specifically stated selling to some private customer. In selling power to the homes of people and that sort of thing he would immediately come under the jurisdiction of the Alabama Commission. That, of course, would be so. He could not go out in competition with the Alabama Power Co. without securing from the commission of the State a certificate of convenience and necessity which the State requires shall be granted.

The CHAIRMAN. Would he not be in competition if he sold to a private consumer or any other kind of consumer? Some other manufacturer, for instance. Suppose I went down there and set up a factory to make something and bought my power of Mr. Ford. Would not the Alabama Power Commission regulate the price?

Mr. FROTHINGHAM. That is not considered, I think, Mr. Chairman, as a public utility operation.

The CHAIRMAN. If the Alabama law does not apply to it, then the Federal law does, it seems to me, because they are utilizing the power of a navigable stream there and are going to handle it and sell it without any restriction.

Mr. FROTHINGHAM. Yes; but we suppose that Mr. Ford's suggestion is accepted, and if it is handed over to him he gets it without regulation, and he has asked that he be free from regulation. If he has to run a transmission line across the country so that he needs a franchise for a transmission line right of way, or something of that sort, that brings him within public utility jurisdiction; but if he can get the power to a private consumer from his own land to the land of the private consumer, that becomes purely a private matter.

The CHAIRMAN. Unless there is something in his contract that gives him that exemption.

Senator HEFLIN. That would not exempt him from the operation of the law of Alabama. Even the Federal Government could not do so unless the Alabama Legislature did it specifically. It would not be exempt from the regulations under our State laws, under a Federal act.

Mr. FROTHINGHAM. I had assumed if the Muscle Shoals site were owned by Mr. Ford, and he wanted to sell a piece of land to Jones & Co. to come in and manufacture some product, and he builds a plant there and runs his transmission line across to Jones & Co., that would be a private operation beyond any jurisdiction.

"This seems to be recognized by paragraph 5 of the Alabama public utility act of 1920, which is as follows:

"SEC. 5. *Limitations.*—None of the provisions of this act shall apply to the generation, transmission, or distribution of electricity, to the manufacture or distribution of gas, to the furnishing or distribution of water, or to the production, delivery, or furnishing of steam for heat or power by a producer who is not otherwise a utility, for the sole use of such producer, or for the use of tenants of such producer, nor shall they apply to any person not otherwise a utility who manufactures and supplies such products to a utility for its use or distribution without participation by such manufacturer in such use or distribution. When a person is engaged in business, a portion of which business is private business and a portion of which business is the business of a utility, the authority, powers, and jurisdiction of the commission conferred upon it by law shall not be deemed to apply to and shall not be exercised with respect to that portion of said business which is a private business."

The CHAIRMAN. If his contract with the Federal Government would permit him to do that.

Mr. FROTHINGHAM. When you come, Mr. Chairman, if I may emphasize this point again, because I think it is one we want to keep our minds close to, and I am very much interested in the public aspect of all this thing, to manufacture current, there has got to be a certain investment. You can not avoid it. Somebody has got to absorb that investment. There is a certain investment in plant, and it costs money to operate the plant. All those costs are there. They have got to be absorbed by somebody. They have got to be paid by

somebody in some way or other. If it is not paid in the direct cost per kilowatt-hour of current, but that current is bought at less than what its costs are, the price is, nevertheless, included in the final price of the finished products which are manufactured. In some way or other, somehow or other, the fair cost of developing these services by whomever they are developed, has got to be paid by the public, and I am arguing for an agency to do this thing which is under complete public regulation and control, that spends its money under Government control and supervision, that receives as its return a fair rate of return upon its investment, which is determined by that governmental power, so that you are beyond any possibility of private initiative taking advantage of the situation for itself.

Senator CARAWAY. If you will pardon me, don't you think your two statements are rather at variance? First, the argument was that we get the benefit of private initiative, and your last statement is that the utility is under complete control and regulation?

Mr. FROTHINGHAM. I said that under public control of privately operated utilities you have the advantage of private initiative and energy, subject to the regulation of the Government. Mr. Vail, before he died, said that in his judgment any operation which could be directly performed by private interests was better so performed, thus—

Senator CARAWAY. I think there is no question about that.

Mr. FROTHINGHAM (continuing). Thus combining the potency of the sovereign with the initiative and interest of the subject. I am simply coordinating those two things. In Alabama there is required a certificate of convenience and necessity before anyone can compete with any public utility in Alabama in its business. Now, that is in the public interest.

Senator CARAWAY. In some way or another I doubt that, because we have had trouble in my own State. We had a company devoted to manufacturing power and electric energy, under the control of the commission. We had trouble with them in the matter of extension of transmission lines. They would not extend their lines 5 miles or 8 miles—I don't recall—

Mr. FROTHINGHAM. But is not that a public responsibility, sir?

Senator CARAWAY. It simply meant that some sections would get the benefit and others would not.

Mr. FROTHINGHAM. But it is under public jurisdiction and it is the public and not the private management that is to blame.

Senator CARAWAY. I think that competition ought to be permitted to have some sway. Now, you want a complete monopoly of electrical energy in that territory by the Alabama Power Co.?

Mr. FROTHINGHAM. I am not speaking about complete monopoly—

Senator CARAWAY. Is not that the purpose of the Alabama Power Co., to get monopoly of all the electrical energy in that part of Alabama?

Mr. FROTHINGHAM. I think I would not put it in that way, sir. The object of the Alabama Power Co., its aim, is to have the opportunity to go ahead and develop these resources, to coordinate them very carefully under public control, in order that it can continue to extend its service to an increasing number of people. Unless you shut out competition, sir; unless the Government shuts out competition in its own interest, there is very grave damage done. It is in the public interest, primarily, that the private agency be not subjected to unlimited competition. The public has determined in its own interest it will not submit to any duplication of power plants or transmission lines, or distributing systems which have got to be absorbed sooner or later, and the costs of which have got to be paid by the public. If one system can give them sufficient and adequate service at proper rates. Just as soon as a private agency can not do that, and another can prove that it can give better rates and service, then there is the public utilities commission to issue such a certificate of convenience and necessity, and your commission will not allow that competition unless it gets something for it. That puts this burden on private initiative, that private initiative, in order to continue to perform the services, must see to it that it gives better service than anybody else can. Otherwise the public authority will give the job to somebody else.

Senator CARAWAY. Now, we have that question in the District of Columbia. In our street car service here. In a hearing before the commissioners the street car company wanted to prevent the issuance of a license for a buss line unless they were permitted to operate the buss line. That is the tendency of monopoly, always to want everything. Their primary object is profit to themselves, and the public gets out of them whatever service they see fit to give.

Mr. FROTHINGHAM. Under public regulation the utility is limited to an adequate return on the money actually used, and that is determined by the commission. I think it is very fair to say that we are all human, and no matter what the economic scheme is that is devised, it can, in instances, be misused. Mistakes can be made under it; troubles can be developed under it. But we have advantages on the whole from that method which holds the possibility of the best service to the greatest number of people, and my belief is, sincerely, as a result of long study, that the method of public regulation of privately operated utilities is the best way of getting that result at the present time. Unless there are some questions, Mr. Chairman, I am through.

The CHAIRMAN. Mr. Frothingham, have you given any consideration to the bill that I have introduced, that is pending now before the committee?

Mr. FROTHINGHAM. I have not, sir.

The CHAIRMAN. Then you are not prepared to comment on it?

Mr. FROTHINGHAM. No, sir.

The CHAIRMAN. Do any members of the committee want to ask any questions? If not, the committee will adjourn until 10.30 o'clock to-morrow morning.

(Whereupon at 12 o'clock noon the committee adjourned to 10.30 o'clock a. m., Friday, April 21, 1922.)

MUSCLE SHOALS.

FRIDAY, APRIL 21, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris (chairman) presiding.

Present: Senators Norris, Capper, Keyes, Gooding, Ladd, Kendrick, and Heflin.

The CHAIRMAN. The committee will come to order. We are ready to proceed with you, Senator Butler.

Mr. BUTLER. Mr. Engstrum would like to make a brief statement.

The CHAIRMAN. All right, Mr. Engstrum, we will be glad to hear you.

STATEMENT OF MR. FREDERICK E. ENGSTRUM, WASHINGTON, D. C.

Mr. ENGSTRUM. Mr. Chairman, for the purpose of having it appear in the record, I will state my name.

The CHAIRMAN. Yes.

Mr. ENGSTRUM. Frederick E. Engstrum; business, president of the Newport Shipbuilding Corporation.

I have been engaged in construction work, constructing and building all classes of structures from railroads to skyscrapers, ships, power plants, industrial plants, such as the American Trona potash plants in California, the American Beet Sugar Co.'s plants, portion of the Salt Lake Railway, Southern California Edison electric power plants, and am just completing a contract, finishing a contract, for 19 concrete ships for the Government, for the Quartermaster's Department.

The CHAIRMAN. Mr. Engstrum, it has not anything to do directly with this investigation, but that statement interests me very much. Just briefly I wish you would tell us something about those concrete ships.

Mr. ENGSTRUM. In 1918 I came to Washington to investigate contracts for building concrete ships. There was an appropriation made then of \$50,000,000. The President had requested an appropriation of \$50,000,000 for the Shipping Board to build concrete ships. I requested a contract from the Shipping Board, but the Shipping Board informed me that they had already selected their builders.

The CHAIRMAN. I did not expect you to go into any great detail, Mr. Engstrum, but just in a general way.

Mr. ENGSTRUM. I was just going to give the way in which these ships were started.

I submitted a proposal to the Quartermaster Department to substitute at that time concrete vessels in place of steel and wooden ships for the harbor and river service. These ships were of the smaller type, 130 feet in length, and was awarded a contract for nine of them, which we built and are in service, under first contract. They were equipped with heavy duty gas engines, twin screw.

The next contract, in the first part of 1920, followed for seven more 150-foot river and harbor vessels, one of them operating on the Potomac between here and Fort Washington.

These smaller type vessels were used between the cities and posts of the Army for carrying the soldiers and supplies between the city and the posts, and in addition we built three concrete tankers to supply fuel. The 150-foot type of vessels are the most economical oil-burning vessels that are in service anywhere that I know of in the world to-day. They operate on 16 gallons of crude oil per hour at 13 miles of speed; a little over a gallon per mile for a 650-ton vessel, 1,000 horsepower, two 500 horsepower Diesel engines. The 300-foot oil tankers are fuel ships.

The CHAIRMAN. Are all those concrete vessels in service now?

Mr. ENGSTRUM. They are all allotted now. They have been laid up temporarily, part of them.

The CHAIRMAN. Have they all been a success?

Mr. ENGSTRUM. Yes; all of our construction has been an absolute success.

The CHAIRMAN. How many of them are there now in service that you have constructed?

Mr. ENGSTRUM. There are 19.

The CHAIRMAN. Nineteen?

Mr. ENGSTRUM. Nineteen; excepting the last, which is just going into service.

The CHAIRMAN. How large are the last 10?

Mr. ENGSTRUM. The last seven are 650 tons, similar to the one on the Potomac River.

The CHAIRMAN. Now, where are those vessels?

Mr. ENGSTRUM. Four of them are allotted on this coast; to Norfolk and Washington and New York and Wilmington, and one is going to San Francisco.

The CHAIRMAN. Are any of them engaged in river traffic?

Mr. ENGSTRUM. Yes, sir; in the Army service, for carrying supplies.

The CHAIRMAN. None of them has been used for general freight purposes?

Mr. ENGSTRUM. No, sir.

The CHAIRMAN. Are they suitable for that?

Mr. ENGSTRUM. They are for passenger and freight. They are day voyage. There are no cabins. They are for shallow water, and draw 9 feet.

Senator GOODING. Are they fit for all purposes; all water navigation?

Mr. ENGSTRUM. Yes, sir. They have been through very severe tests. This vessel here has driven through 8 inches of ice continuously during the heavy winter season, and the concrete hulls under the most severe tests have shown no cracks or deterioration whatsoever.

Senator GOODING. Have any of the vessels weathered any storms up to the present time in any way?

Mr. ENGSTRUM. Four of those vessels about a month ago broke loose from their moorings at the mouth of Cape Fear River, at Caswell, where they were sent for allocation, and they were driven out to sea without anyone on them. The currents and the winds brought them back around the Frying Pan Shoals at the mouth of Cape Fear River, at the Cape Fear Lighthouse. They were driven back into the breakers and pounded the shore in the breakers for 18 hours, and were rescued by tugs putting men aboard and starting up the engines, and taking them off under their own power, and were then brought back into the river.

The CHAIRMAN. Were they damaged?

Mr. ENGSTRUM. They were not damaged—only the rails. The wooden end rails were broken by collision with each other. The hulls were not damaged.

The CHAIRMAN. All right, Mr. Engstrum. We will go back now to your offer.

Mr. ENGSTRUM. I will, if you please, state some of my experience, Mr. Chairman.

The CHAIRMAN. How old are you, Mr. Engstrum?

Mr. ENGSTRUM. Forty-seven. I have been engaged all my life in contract construction work. My father was in the business before me, and I was with him until he passed on. In offering my proposition on the Muscle Shoals, my attention was directed to this more than a year ago—a year ago last April. I sent an engineer to Muscle Shoals to make a report to me on conditions there. I think Mr. Ford submitted his proposal some six months afterward. After that I visited Muscle Shoals to verify my reports and prepare data with which to submit the offer, and later I visited the plant again.

In pointing out the principal features of my offer I should like to have Senator Butler make a statement. He is associated with me in this undertaking as counsel, and will be one of the directors of the corporation which I

propose to form. If it is agreeable at this time, Mr. Chairman, I would like Senator Butler to be heard.

The CHAIRMAN. All right. Follow your own plan, Mr. Engstrum.

STATEMENT OF HON. MARION BUTLER, ATTORNEY FOR MR. FREDERICK E. ENGSTRUM.

Mr. BUTLER. Will it not be best at this time, Mr. Chairman, to have the proposal read into the record?

The CHAIRMAN. Yes. I presume the committee has read the proposal. I have. I have been studying it this morning. But it would be very proper, I think, to put it into the record. Perhaps it would be sufficient to print it in the record. But that is only a suggestion, Mr. Butler. You do as you please about it. We do not want to interfere with your presentation in any way.

Mr. BUTLER. Then I ask that the proposal go into the record. There are some typewritten amendments to the printed copy, which will be explained as I reach them; I would like the proposal to go into the record with those typewritten amendments.

The CHAIRMAN. Senator, let me ask you this: I have in my possession what is termed an amended proposal. Now, is that amended further?

Mr. BUTLER. Just those typewritten slips.

The CHAIRMAN. Are in addition to that?

Mr. BUTLER. Yes. I desire the complete proposal with amendments, including the typewritten slips, to go into the record.

The CHAIRMAN. You want the reporter to print this as amended, I suppose?

Mr. BUTLER. Yes; print it with the typewritten amendments in it as if they were printed in.

(The proposal, as amended, is in the following words and figures:)

PROPOSED AMENDED CONTRACT FOR COMPLETION AND LEASE OF MUSCLE SHOALS.

WAR DEPARTMENT,
Washington, February 24, 1922.

DEAR MR. SPEAKER. I inclose herewith an offer for the Muscle Shoals properties submitted by Frederick E. Engstrum which I think should be considered in connection with the investigation now being made by Congress.

JOHN W. WEEKS,
Secretary of War.

The SPEAKER OF THE HOUSE OF REPRESENTATIVES.

AMENDED FORM OF PROPOSED CONTRACT FOR COMPLETION AND LEASE OF MUSCLE SHOALS PROJECT BY FREDERICK E. ENGSTRUM.

[Omit the words struck through and insert the words printed in italic.]

1. *Parties.*—Memoranda of contract made this _____ day of _____, 1922, by and between the Government of the United States, party of the first part, and hereinafter referred to as the Government, and Frederick E. Engstrum, of the city of Washington, D. C., for and in behalf of a corporation to be formed by him to carry out the provisions of this contract and to be governed by a board of seven directors, one to be selected by the Secretary of War, one by the Secretary of Agriculture, and the remaining five by proponent, party of the second part, and hereinafter referred to as the lessee.

2. *Lease.*—The lessee hereby leases all the property—real, personal, or mixed—now owned or hereafter acquired by the Government in connection with or forming part of, or extension of the Muscle Shoals project, or any part or appurtenance thereof, excluding the steam plant, located at Gorgas, Ala., on the Warrior River, but including the transmission lines from said plant to Muscle Shoals for use at present location or elsewhere as will best serve the purposes of this lease. Said property is included or intended to be included in the maps, deeds, descriptions, invoices, lists, and schedules furnished to the lessee by the Government and receipted for, and such maps, deeds, descriptions, invoices, lists, and schedules, together with receipts for same, hereinafter referred to as the schedule, shall be a part of this agreement and shall bind both parties.

3. *Term.*—This lease is to continue in full force for a period of 50 years from date the lessee acquires possession of the property. The lessee shall return said property at the termination of this lease to the Government in good operating condition, subject to damage beyond fault or control of the lessee.

4. *Plans and specifications.*—It is mutually agreed by both the Government and the lessee that, for and in consideration of the lease, construction, operation, rights, privileges, payments, and other considerations hereinafter mentioned or otherwise provided for in this agreement, that the lessee will construct Dam No. 2, power station, steam plant No. 2 to a capacity of 90,000 kilowatts and steam plant No. 1 to a capacity of 10,000 kilowatts and such other structures now under construction or agreed to be constructed at Muscle Shoals, on the Tennessee River, in the State of Alabama, and hereinafter referred to as the "property," as are set forth and described more particularly in the maps, plans, specifications, photographs, and other engineering data (hereinafter referred to as the plans), copies of which have been delivered to lessee and duly receipted for by lessee, and such plans thus receipted for are hereby made an essential part of this contract and are as binding on both parties as if they were fully set forth and written herein. When the Government shall require the construction of Dam No. 3, for which there are no complete engineering plans, the lessee agrees to build the same on plans and specifications to be prepared by the Government and on a location to be approved by the Government. Lessee also agrees to build, at dam No. 3, another nitrate plant, of the most improved process, by plans and specifications submitted to and approved by the Secretary of War and the Secretary of Agriculture, which plant shall have the same relative output capacity to the power to be generated at dam No. 3 as is the combined capacity of nitrate plants Nos. 1 and 2 to the power to be generated at dam No. 2, other dams, and nitrate plants which may be built to conform to the same terms: *Provided*, That if the Warrior Steam Plant is not included in this lease, then the Government's interest in the same shall be sold and the proceeds used to enlarge and equip steam plants No. 1 and No. 2 at Muscle Shoals and the balance of said proceeds shall be turned into the fund for financing the production of nitrates and fertilizers as described in paragraph 6.

5. *Locks or lifts.*—It is further agreed that the lessee will construct for the Government the locks or lifts for the purpose of maintaining navigation over the dam or dams to be constructed at Muscle Shoals.

6. *Manufacture of nitrates.*—When the two nitrate plants, now a part of the property, which plants have an estimated capacity of 120,000 tons of ammonium nitrate per annum, have been redesigned and reconstructed as herein provided to manufacture such nitrates as are needed for commercial fertilizers, fertilizer compounds or mixtures as approved by the Secretary of Agriculture, the lessee agrees to operate said plants under the following conditions:

As soon as adequate hydroelectric power, generated at dam No. 2 becomes available, lessee will commence to operate both plants and will continue such operation to the capacity they can be operated, after deducting operating expenses, from the receipts of the sale of:

(a) Nitrates and fertilizer compounds,

(b) Seventy-five per cent of all marketable by-products not required for the manufacture of nitrates or fertilizer compounds,

(c) Sixty-six and two-thirds per cent of all power generated in excess of that required to operate the plants, which is sold by lessee either to itself or to other parties, provided that the price at which power, if any, is sold to lessee is subject to approval by the Secretary of War; and including the fund from the sale of the steam plant provided for in paragraph 4.

(d) In the event said fund is not sufficient to operate said plants continuously lessee will contribute to said fund for said purpose 20 per cent of its gross receipts from sale of power while such conditions exist.

The term "operating expenses" as used herein shall be understood to include the necessary and legitimate expenses for the proper operation of the entire plant for the purposes set forth in this agreement, including maintenance, alteration, repairs, and replacements, but not including the salaries of officers, directors, general manager, supervising engineers, and counsel fees of the operating company, the lessee.

When additional dams and nitrate plants shall have been built they shall be operated by the lessee under the same terms, except that the percentage of receipts from the excess power sold from such dam or dams—which is to be turned into the fund for the operating of such plants or to be paid into the Treasury, as the case may be—shall be 75 per cent thereof instead of 66½ per cent of such power from Dam No. 2 (as provided in subparagraph (c) above), and shall be in addition thereto.

7. *Alterations of nitrate plants.*—It is also agreed that the lessee will make such alterations, additions, or changes in the nitrate plants as may be required to produce the nitrates or other fertilizer compounds approved by the Secretary of Agriculture, and to be completed within the time required to produce hydro-electric power at Dam No. 2. After the plants have been put in operation under this lease the lessee shall make such additions or changes from time to time as may be necessary to produce the required fertilizer or fertilizer compounds approved by the Secretary of Agriculture, and such changes are to be made as an operating charge.

8. *Plans of alterations.*—It is agreed that the lessee will furnish the Secretary of War copies of the plans and specifications of the proposed changes to be made in the nitrate plants to fit them to produce the nitrates and fertilizer compounds approved by the Secretary of Agriculture. Such alterations are to be designed as to keep the nitrate plant No. 2 in condition to produce explosive compounds with the least delay and expense.

9. *Research.*—The lessee agrees to maintain and operate a research department in cooperation with the Agriculture Department of the Government for the purpose of developing the processes for the fixation of atmospheric nitrogen, the cost of research work to be charged to operating expenses of the plant.

10. *Construction.*—Lessee agrees to begin construction within a reasonable time after it is given possession of the property and to continue such construction in a diligent, business, and workman like manner until all construction work provided for under this contract shall be completed, according to terms herein set forth, within three years from the time of possession, reasonable extension of time to be granted for delays over which the lessee has no control.

11. *Changes.*—It is further agreed that at any time during the construction if, in the opinion of either party herein, the structures provided for in the plans have become, or are liable to become, weak, dangerous, uncertain, or inefficient they may request changes, extensions, or additions to be made in the plans for the purpose of increasing the strength, stability, duty, endurance, or efficiency of the dams, locks, power stations, or other structures to be built by lessee under provisions of this contract, such changes, extensions, or additions shall be submitted to the engineer representing the other party and to the surety company furnishing the bond of the lessee, and if such changes, extensions, or additions shall be approved by the engineer representing the other party and the surety company they are to become a part of this contract and become as binding on both parties and the bonds of the lessee as if originally written herein.

12. *Arbitration.*—It is also provided that, in event a request of either party for changes, extensions, or additions in the plans for any of the purposes set forth in the foregoing paragraph of this contract has been approved by the surety on the bond of the lessee, and has not been approved by the engineer representing the other party, then the questions of endurance or strength of such material or members as can be determined by physical test shall be submitted to the United States Bureau of Standards for final determination, and all questions as to the effect of the proposed changes, extensions, or additions upon the increase of strength, stability, duty, endurance, or efficiency of the dams, locks, power stations, or other structures to be built under this agreement, the plans for the changes as requested shall be submitted to the engineering faculty, or such members thereof who will undertake the work, of one or both of the following-named universities or schools of technology: Massachusetts Institute of Technology, Cambridge, Mass.; Cornell University, Ithaca, N. Y.; and the report of such faculty or faculties, if submitted to more than one, together with the report of the Bureau of Standards, shall be final; and if such report of the Bureau of Standards and faculties of technical schools, mentioned herein, show that the proposed changes, extensions, or additions will materially increase the strength, stability, duty, endurance, or efficiency of the structures affected by the changes, extensions, or additions, then such changes, extensions, or additions shall become a part of the working plans of this contract, the same as if they were originally written herein or had been approved by the engineers of both parties and the surety bond.

13. *Costs of tests.*—It is also understood and agreed that the cost of testing, consulting, or other expenses caused by the request for changes in the plans, as provided for, shall be a part of the construction cost provided herein.

14. *Representatives.*—It is understood and agreed that during the time of construction that both parties hereto shall designate an engineer to represent

them on the work, and the acts of such engineer shall be binding as to the party designating him as a representative.

15. *Investment.*—It is agreed that the lessee will not be required to invest in the manufacture of nitrates or other fertilizer compounds any money, other than that received from the sources enumerated in paragraph 6. The lessee agrees, however, to advance all the money that may be necessary for "operating expenses" until sufficient funds are received from the sources enumerated in paragraph 6, the said money so advanced to be reimbursed as soon as practicable.

16. *Sale of products.*—It is further agreed that the lessee will sell all nitrates and fertilizer compounds produced by the plant at prices and on conditions and terms approved by the Secretary of Agriculture, and also will sell all by-products not required in the manufacture of fertilizer compounds, for which there is a market, and all excess power for which there is a market, it being understood and agreed that primary power may be sold and the nitrate plants may be operated by secondary power to the extent that the same can be done to assure the best financial returns for the operation of the plant and to produce a maximum of nitrates and fertilizers under this contract.

17. *Additional plants.*—It is further agreed that in event the development of power for use and sale from this plant, together with the receipts from the sale of products, should be insufficient to produce the amount of fertilizer compounds required to supply the demands, the lessee agrees to construct, under the terms of this agreement, other power plants or storage reservoirs upon sites owned by the Government and selected by the Secretary of War and itself, said plants or storage reservoirs to be constructed and operated under the general terms of this agreement for the purpose of enabling it to provide the fertilizer compounds to meet growing needs.

18. *Profits from nitrates.*—It is further agreed that when nitrates for fertilizers and fertilizer compounds can be made at a profit, or when the cost of the same has been so reduced that the funds arising from the sources enumerated in paragraph 6 are not needed in whole or in part for financing such productions as herein stated the said funds not needed for operating expenses shall be paid by the lessee into the Treasury of the United States. When said funds paid into the Treasury shall be in excess of the amount received from sale of excess power, as described in paragraph 6, it is understood and agreed that during the period such conditions exist fertilizers are made at a corresponding profit, and the lessee shall be entitled to 25 per cent of such profit.

19. *Consideration.*—In consideration of the performance of the foregoing proposals and conditions, the Government shall agree to pay to the lessee for the completion of Dam No. 2 the initial alterations of nitrate plants No. 1 and No. 2, the completion of the locks at Dam No. 2, the completion of steam plant No. 1 to a capacity of 10,000 kilowatts and steam plant No. 2 to a capacity of 90,000 kilowatts, and, when required by the Government, for the building of Dam No. 3 and nitrate plant No. 3 and the locks at Dam No. 3 and additional dams and nitrate plants and storage reservoirs, the actual cost of the same, respectively, together with a fee of 5 per cent on such cost in each case, in monthly payments, as per estimates of the engineers upon schedules of work performed. The cost in each case is to be determined by the lowest responsible bid resulting from a public offer by lessee and by the contract awarded by lessee to such bidder, subject to approval by the Secretary of War. It is understood and agreed, however, that if the Government shall decide to finish Dam No. 2 that lessee will accept a lease subject to that modification of this proposal.

20. *Payments.*—It is agreed that the engineers representing the Government and lessee shall on the 1st of each month furnish the lessee and the Secretary of War an estimate of the work performed and a statement of the amount earned by lessee during the preceding month.

21. *Stores, stock, and equipment.*—All stores, supplies, equipment, including engineers' supplies, files, and instruments, and other loose personal property now on or about the premises, whether or not required for construction purposes, but not including subsistence stores, shall become the property of the lessee upon the execution of this contract.

22. *Compensation.*—It is further agreed that as compensation for the performance of this contract the lessee shall retain:

(a) The proceeds from the sale of 33 $\frac{1}{3}$ per cent of excess power from Dam No. 2 not required to operate the plant or plants, and locks or lifts, the other 66 $\frac{2}{3}$ per cent to be contributed for operating expenses, as provided in paragraph

6; and when Dam No. 3 is built the proceeds from the sale of 25 per cent of excess power from Dam No. 3 not required to operate nitrate plant No. 3 and locks or lifts at Dam No. 3, the other 75 per cent to be contributed toward the operating expenses as provided in paragraph 6; the same percentage last above named to apply to all other dams and nitrate plants that may be built hereunder: *Provided*, That 20 per cent of such proceeds are to be contributed toward the financing of the manufacturing of nitrates and fertilizers whenever the condition named in paragraph 6, subsection (d), shall occur and while the same shall continue.

(b) The proceeds from the sale of 25 per cent of all by-products for which there shall be a market and not required in the manufacture of fertilizer compounds or mixtures; the other 75 per cent to be contributed toward operating expenses, as provided in paragraph 6.

(c) Twenty-five per cent of the profits on the manufacture of fertilizer compounds, if and when the same shall be made at a profit as provided for in paragraph 18; the other 75 per cent to be contributed toward operating expenses, as provided in paragraph 6.

23. *Power for locks.*—The lessee agrees to furnish to the Government, free of charge, all power required to operate the locks or lifts which are to be operated by the Government.

24. *Emergency provision.*—The lessee agrees to place the property, or any part thereof, at the disposal of the Government in the event of war or any other public emergency, or to operate the same for the Government to manufacture nitrates, explosives, or munitions of war or for other purposes necessary for the safety of the United States, as the Government may require.

25. *Bond.*—The lessee agrees to protect the Government for the full and faithful performances of the contract by giving a good and sufficient surety bond, to be approved by the Government.

26. *Inspection.*—It is agreed that the Government experts, inspectors, and accountants can at all reasonable times examine the books, papers, accounts, meters, and such other accessories of the plant necessary to satisfy them, whether or not the lessee is executing this contract in good faith.

27. *Repairs.*—It is also agreed that should the foundation of Dam No. 2 be found defective or show excessive leakage, the Government will pay to the lessee the expense of the necessary repairs, including a reasonable allowance for overhead.

28. *Proposal divisible.*—The above proposals are submitted for acceptance in whole or in part as provided in section 19 hereof. Upon acceptance it shall be binding upon the Government and the lessee, its successors, and assigns; and all contracts, leases, and other instruments necessary or appropriate to effectuate the purpose of this proposal, as accepted, shall be duly executed and delivered by the respective parties above mentioned.

In witness whereof the United States of America has caused these presents to be executed by the Secretary of War, pursuant to authority conferred upon him by act of Congress, approved the _____ day of _____, 1922, entitled "An act to provide for the lease and completion of Muscle Shoals, and for other purposes"; and the said Frederick E. Engstrum has set his hand on the day and year first herein above set forth.

UNITED STATES OF AMERICA.
By _____, Secretary of War.
FREDERICK E. ENGSTRUM.

Mr. BUTLER. Mr. Chairman, before taking up the proposal paragraph by paragraph, I desire to refer briefly to the situation and conditions which have brought forth these hearings.

It is well known that there was an inadequate supply of nitrogen in a form available for explosives and for fertilizers in this country and over the world before the World War; indeed the supply was inadequate for fertilizers alone. The scarcity of nitrogen became acute during the war on account of the sudden need for nitrogen for explosives, while the soil was starved for want of nitrogen in fertilizers. Our supply of nitrogen has practically reached its limit from the old sources; the by-products of coke ovens and other smaller and less important by-products, and from the natural deposit of sodium nitrate in Chile. We are reaching the end of the supply in Chile—the end is in sight.

Hence, we are to-day face to face with a situation where we must get nitrogen from some new source, in order to have an adequate supply for the increasing needs of civilization, to say nothing of the danger of war needs. There is no

known source of adequate supply, except from the air. Therefore the problem of the fixation of nitrogen from the air is now before us as one of the most important and crucial questions affecting the progress of civilization.

When the World War broke loose we found ourselves—even before we entered that war—where we did not have in sight in this country or where we could get any where in the world sufficient nitrogen for our present and imminent needs. It was a realization of that serious situation which caused Congress to enact what is known as the National Defense Act; that was before we entered the war, June 3, 1916.

Now, Mr. Chairman, while you are all familiar with that act, yet I would like to put section 124 into the record at this point.

The CHAIRMAN. I think it would be a good idea to read that and let it be put in in that way. The committee ought to be reminded of it, perhaps.

Mr. BUTLER. I will read it; it can not be read too often, because to-day we are face to face with the question of whether we are going to go forward with or are going to reverse that declared policy of our Government. That act was passed none too soon. This country would have been more prosperous and in a much better condition industrially to have met that war if we had passed that act sooner, because we needed the nitrogen for fertilizers even before this act was passed, regardless of the threatened additional needs for nitrogen for war purposes.

Section 124 might be called the "nitrogen preparedness" section of that law. It is headed, "Nitrate supply," and reads as follows:

"Sec. 124. *Nitrate supply.*—The President of the United States is hereby authorized and empowered to make or cause to be made such investigation as in his judgment is necessary to determine the best, cheapest, and most available means for the production of nitrates and other products for munitions of war and useful in the manufacture of fertilizers and other useful products, by water power or any other power as in his judgment is the best and cheapest used. He is also hereby authorized and empowered to designate for the successful use of the United States, if in his judgment such means is best and cheapest, such site or sites upon any navigable or nonnavigable river or rivers or upon the public land as in his opinion will be necessary for carrying out the purposes of this act, and is further authorized to construct, maintain, and operate at or on any site or sites so designated dams, locks for improvement of navigation, for power houses and other plants and equipments, or other means than water power as in his judgment is the best and cheapest necessary and convenient for the generation of electricity or any other power and for the production of nitrates or other products needed for munitions of war and useful in the manufacture of fertilizers and other useful products."

That legislation shows that in 1916, while only in the shadow of war, Congress, when preparing for possible war, had in mind the need and provided for more nitrogen for fertilizers, even if war should not come. The great water power on the Tennessee was selected to be developed and devoted to "nitrogen preparedness" for both peace and war. We at once made plans to build two dams at Muscle Shoals. Dam No. 1 was to be a small dam for the purposes of navigation; Dam No. 2 was to be a great hydroelectric dam to furnish power to operate nitrate plants. We started the construction of Dam No. 2, and also built two nitrate plants, one by what is known as the Haber process and the other by what is known as the cyanamid process for the fixation of atmospheric nitrogen. We also built two steam plants by these two nitrate plants, to be used to supplement the water power during the low-water stages of that river.

When this country entered the war none of this work was completed, so we rushed the completion of the nitrate plants and equipped them to make only the kind of nitrates needed for explosives, and we rushed the completion of the steam plants to run these nitrate plants until the hydroelectric dam (Dam No. 2) could be completed, but the war stopped before Dam No. 2 was half finished, though we did succeed in producing nitrogen for explosives (known as ammonium nitrate) at one of these nitrate plants by the use of the steam power. One of the nitrate plants was not a success, and the war closed before we could redesign it so as to make it fix nitrogen from the air.

After the close of the war, Congress failed to make the necessary appropriation to proceed with the work on Dam No. 2, and to make the changes and additions to these nitrate plants to equip them to make the kind of nitrates needed for fertilizers as well as the kind needed for explosives. The situation to-day is that we have spent \$106,000,000 on that great project at Muscle Shoals, but since the war we have allowed that great investment to stand idle, the valuable

property deteriorating and the greatest water power east of the Mississippi running to waste, while our starved soils are crying for more nitrogen.

Now, Senators, what are we going to do about it? Our duty seems to be too plain for argument. We should not have halted this work at the end of the war. We should have gone forward with the declared purposes of the national defense act. The needs for nitrogen for agriculture are now greater than before the war. We should finish Dam No. 2 at once, and at the same time we should equip both nitrate plants to make nitrogen for fertilizers and put them running day and night as soon as possible.

This investment at Muscle Shoals is not a war-time expenditure on temporary work for a temporary purpose, to be scrapped after the war. It is a permanent investment for a permanent and continuous purpose. The construction is of a solid and substantial nature and designed for permanent use—nothing that should be scrapped—but it should be used for the purposes for which the money was appropriated. The money already spent on the dam is a good investment, but the work already done will soon begin to deteriorate if we do not go ahead and finish it.

We have wasted some money on the nitrate plants, but we knew very little about the fixation of atmospheric nitrogen. We had let everybody else learn more about it than we had, though we were in greater need of nitrogen than any other country in the world claiming to be civilized. So in the emergency of war we were caught without enough nitrogen for explosives alone, and there was no source for a sufficient supply of nitrogen except from the air, and we found that we did not know anything about it. So we went blunderingly ahead to do the best we could with such very limited knowledge as we could gather from others and at a time most unfavorable for getting information from other countries. It is wonderful that we made as much progress as we did.

Senator KENDRICK. Mr. Chairman, I just want to say in confirmation of the witnesses's statement that during the critical period of the war one of the members of the Senate Committee on Military Affairs told me, with a very great apparent spirit of depression, that it looked like not only our country but the Allies were to be entirely cut off from any nitrate supply.

Mr. BUTLER. And because we had allowed our enemies in that war to learn how to secure nitrogen from the air, where there is an unlimited supply, while we knew nothing and had tried to do nothing until the passage of the national defense act in 1916. During the war Germany produced from the air all the nitrogen she needed for explosives; when the war was over she did not stop; she proceeded to produce nitrogen for fertilizers. Last year Germany produced from the air over 400,000 tons of nitrogen for fertilizer, while we did not produce a pound from the air.

The CHAIRMAN. What process did Germany use?

Mr. BUTLER. She used both processes. There are two well-known and successful process; the cyanamid process is the older one; the Haber process is the newest, and the improved method. Germany produced 300,000 tons by that process and 100,000 by the old cyanamid process. The Haber process is the cheapest and most efficient, and all of her new plants are of that kind. They are quite different in their operations in the methods of getting the nitrogen from the air and the hydrogen from the water, and then combining the two to make ammonia; for that is the way we make ammonia, by combining those two elements from air and water and getting rid of the oxygen out of each.

Germany, years ago, as soon as the cyanamid process was a success, put up a number of plants, because she was determined not to be dependent on other countries for her nitrates for munitions or nitrates for fertilizer.

Senator CAPPER. Did the Government put up those plants?

Mr. BUTLER. The Germans?

Senator CAPPER. The German Government.

Mr. BUTLER. They were put up either by the Government or under Government subsidies. The development was all done under Government initiative, either done by the private individuals under Government instruction and with Government aid, or directed by the Government. Is that your understanding, Major Burns?

Major BURNS. My understanding is that they are built with Government aid by private capital.

Senator CAPPER. That was my understanding; Government aid with subsidy, but by a contract.

The CHAIRMAN. It would be interesting right at this point to know, and can you tell us, Major, with reference to the present condition in Germany, what proportion of the nitrogen is obtained by the cyanamid process and what proportion by the Haber process?

Major BURNS. They are making, all told, in Germany to-day, as I know it, 500,000 tons of nitrogen and 300,000 tons are manufactured by the Haber process, 100,000 from the cyanamid process, and 100,000 tons from by-product coke-oven ammonia.

The CHAIRMAN. What power do they use for the cyanamid process?

Major BURNS. They have used steam power, I think.

Mr. BUTLER. They have no water power, practically, in Germany?

The CHAIRMAN. That is my understanding. The point I want to reach is: Their production by the cyanamid process, therefore, must be very expensive.

Major BURNS. Yes, sir; it is; and it is unquestionably going out of existence in Germany.

Senator HEFLIN. That was the question I was going to ask, Mr. Chairman, as to how Germany derives her power, whether from water or steam.

Major BURNS. I think she derives it from steam.

Mr. BUTLER. That is practically all she has.

The CHAIRMAN. I think it is conceded, Senator Butler, by the experts, that we could not get nitrogen from the air by the cyanamid process without a cheaper power than we could get from steam and produce it at a price that would even compete with the present market.

Mr. BUTLER. That is true. Germany finding the cyanamid process very expensive by steam power, and determined not to be dependent upon a supply as far off as Chile, in a foreign country, put her scientists to work to find a cheaper process. They reasoned that since nature has so built a plant that it breathes air into its lungs and takes out the nitrogen for its growth, and that humans are so built that we breathe the air into our lungs and take out the oxygen for our growth, that man should be able to study out a method to do the same thing artificially.

They worked out first the cyanamid process, but were never able to improve it to where they could make nitrogen economically with steam power. Since they have no water power and never can have, they began to look for a cheaper process. The result is the Haber process, which is much cheaper and much more efficient, in every way. And this process is thought to be capable of much more improvement. That process is just in its infancy, and either the Germans or we or somebody will greatly improve that process soon. Everybody agrees that the Haber process is susceptible of development and improvement to a greater extent than is possible under the old cyanamid process.

The CHAIRMAN. One of the great distinguishing features between the two processes is that in the cyanamid process power is the principal expense, because it requires so much power, and under the Haber process the power is a very inferior consideration.

Mr. BUTLER. That is true; the Haber process requires much less power; that is one of its economies, but it otherwise is a cheaper and more efficient process. The cyanamid process is a proven success; the only trouble with it is that it is expensive, and its use is practically prohibited except where there is an abundance of cheap water power. It was the want of water power primarily that drove Germany to search for a cheaper process. All that time, however, we have had an abundance of water power which we have allowed to run to waste like a drunken sailor spends his money; we have been talking conservation, yet we have never applied conservation to water power. You can not conserve water power by leaving it for the use of future generations like you can coal and timber. The only way to conserve water power is to use it every minute. When it has gone over the dam it has gone forever—it is wasted. With our great abundance of water power going to waste, we could have outstripped Germany every day under the cyanamid process, making nitrates cheaper than she made them—cheap enough to sell to her and the rest of the world—but we didn't do it. Next, Germany is forced by necessity to work out the Haber process, yet we permit ourselves to be caught in the late war without having ever produced a single pound of nitrogen from the air by either process. We have been so busy making money by using up the great store of natural resources which Providence has put here since creation that we have not used our creative capacity and our inventive genius as we should. We have done but little thinking; we have not encouraged anyone to think.

And so, in a way, we have been a very unprogressive and an improvident Nation. We have never properly encouraged initiative so to develop scientists and inventors. We have actually driven some of our greatest inventors abroad for encouragement and help. In the beginning we drove Fulton to Europe with his steamboat. We drove Maxim to Europe with his inventions. We drove the inventor of the airplane abroad to finance his invention.

Senator KENDRICK. We did the same with the submarine, did we not?

Mr. BUTLER. Yes; we also drove the inventor of the submarine abroad. I was a member of the Senate Committee on Naval Affairs at the time. The original submarine was brought here in the Potomac River for inspection and demonstration. I could not induce many to go and look at it, much less to go down in it. We refused to help the inventor and drove him abroad with that great invention.

The CHAIRMAN. Maybe that failure came from the fact that you tried to make people go down into it.

Mr. BUTLER. I was willing for them to look at it and then come back and vote enough money to buy that one boat, but we failed.

The CHAIRMAN. I went down in one, and while I would not miss the experience, I would not give a nickel to go down in another.

Senator HEFLIN. I went down in one also.

Mr. BUTLER. But it should be said to the credit of our graduates from Annapolis that, as dangerous and as uncomfortable as the submarines were at first, yet there never was an hour that we did not have some of our boys ready to volunteer their lives to work out the art; they appeared before the committees of Congress and offered their services, if the Government would buy that boat. That was a typical exhibition of what real American spirit is when it is put to the test. All I have been saying to our discredit does not discredit the raw material that is in us, but we have not used it. We have not, as a people, and as a Government, utilized the resources and opportunities before us.

Senator HEFLIN. You spoke a little while ago about the nitrate supply of Chile nearing exhaustion. Is that the situation?

Mr. BUTLER. I think that there is no controversy on that point. The Chilean deposit can not last longer than 25 years, at the present rate of use. But our demand for nitrogen is increasing at the rate of $7\frac{1}{2}$ per cent a year; so if we are to depend upon Chile for our supply, we will be calling on her in 10 years for twice what we are getting now. But no matter how long that deposit may last, it is certain to give out some time, and each year the supply will get scarcer and the price will go higher. Do we want to force our agriculturists to depend on such a supply and to be at the mercy of an unregulated price. The price of Chilean nitrates is now too high compared with the selling price of farm products.

To-day our farmers would use twice as much nitrogen if they could get it cheaper. It is the high price, and not the indisposition of our farmers to use the nitrogen that caused us to use only 175,000 tons last year, while our soil needs several times that amount. Besides we must remember that we could not get from Chile during the war a sufficient supply for explosives alone.

Senator KENDRICK. I wanted to ask a question, if I may, Mr. Chairman.

The CHAIRMAN. All right.

Senator KENDRICK. On about what date was the first real production made of fixed nitrogen from the air?

Mr. BUTLER. I am not sure of the date. Major Burns, are you?

Major BURNS. I think the cyanamid process came into being about 1908 or 1909.

Senator KENDRICK. That would be about twelve years?

Major BURNS. Fourteen years ago. And I believe the Haber process came into being about 1913 or 1914; just prior to the beginning of the World War.

Senator KENDRICK. Has there been great improvement made in the process since that time, or has it stood rather stationary?

Major BURNS. The cyanamid process is practically a perfected process at the present time. There are very few additional possibilities. That however, is not true of the Haber process. There are many possibilities in it. For instance, in the welding together of the gases, nitrogen and hydrogen, you only weld to the extent of about 6 or 7 per cent. The other 93 or 94 per cent is not joined at all. If you could get a better catalyst, a little better process, you can unquestionably, in the future, weld these gases to a much greater percentage, and it will have a very marked effect upon the efficiency of the process.

Senator KENDRICK. The object of my question is to indicate the possibilities of cheapening this process so that in the near future we may have an output, or production, as the witness has testified, at a cost that will enable farmers of our country to use just as much of it as they think is required for the soil.

Mr. BUTLER. I am coming to that under the re-designing of these plants, because they are now equipped to make only nitrates fit for explosives.

During the war we did the best we could in building those two plants. The cyanamid process, as Major Burns says, was a completed process and we knew all about it, though we had not used it. But we knew practically nothing about the Haber process, because Germany had recently worked it out and besides she kept the process a secret as far as she could. Therefore, when we built those two plants down at Muscle Shoals, plant No. 2, the cyanamid process, was a success, because we knew all about that, and we had cheap water power there, so if we had gotten Dam No. 4 finished, we could have made nitrates there cheaper than Germany could by that process.

The great point with the process is to find the cheapest water power possible. With the finishing of Dam No. 2, we can probably produce nitrates by the cyanamid process at Muscle Shoals cheaper than they can be produced anywhere else in the world by that process. We hope soon to produce nitrates by even that old and expensive process cheaper than the present selling price of Chilean nitrates.

Now, we hope to do it, but it has not been done yet. We will probably start at a loss with the cyanamid plant; the experts of the Agricultural Department and the experts of the Ordnance Department say we will start at a loss. But we are very hopeful that that condition will not last very long and certainly it will not if we can figure it on the basis I have just stated. We do feel, however, that from the start we can, by the Haber process, make nitrates that will compete with the present selling price of Chilean nitrates.

Nitrate plant No. 1 will have to be changed very much. When we built that plant we did not know anything about the Haber process. We just experimented, we did the best we could. But our failure turned to be a blessing to us in a way, because it put our experts in the Agricultural Department and in the Ordnance Bureau of the War Department to studying on their own initiative how to make that plant a success; and if the war had gone on much longer we would have made nitrate plant No. 1 a complete success. We know now how to make it the best Haber-process plant in the world.

We did not know during the war what catalyst the Germans used. That was one of their secrets. Each country to-day that is making nitrogen from the air by the Haber process has its own catalyst, which is a secret. It is a metal or a composition that will perform a certain function. A catalyst is different in different combining processes. Platinum will act as an effective catalyst to form some combinations. It won't do it in this process. Everything that was known to be an effective catalyst in any combination of elements would not serve to tie nitrogen and hydrogen together to make ammonia. It seems to require a certain combination of metals. While Germany has her combination, we had no effective combination, and we could not get hers, and, as Major Burns has just told you, that was our chief trouble at that plant. Our experts went to work during the war to produce an effective catalyst, and they did not stop, fortunately, when the war stopped. Congress stopped thinking when the war stopped and would not vote any money to finish this project, but, fortunately, our experts did not. Having gotten their minds started, they continued to study how to make an effective catalyst, and we have, since the war, produced the most effective catalyst in the world. Our catalyst is a secret. It should be kept a secret. But we have tested it, and while the German catalyst is only 6 per cent efficient—those are the figures, are they not, Major Burns?

Major BURNS. Those are approximately the figures.

Mr. BUTLER. Yes, and our catalyst is 16 per cent efficient, according to tests made here in Washington. So we have perfected a catalyst that ties together 16 per cent of the nitrogen and the hydrogen, which is the best catalyst in the world. This is one of the good results that has come from the war. We think when a war is on we make progress, but we ought not to stop when the war is over. That invention is lying right here in the possession of the Government and is not being used. We can put that catalyst down there in nitrate plant No. 1 and surpass Germany almost three times in efficiency, and any other country, so far as we know.

The CHAIRMAN. Now, Senator, is it not proper to say that this 16 per cent is really a laboratory test, and has not been tested out in real manufacture?

Mr. BUTLER. Yes; that was a laboratory test, and while we do not usually get as good results in practical operations as we get in such tests, yet I think it safe to say that we feel sure that we now have a catalysis which is about twice as efficient as the German catalysis. I was going to make that explanation in a moment; but one thing is certain, and that is that we have to-day the most efficient catalysis in the world, and one which we expect to be at least twice as efficient as the German catalysis. Is that in harmony with your judgment, Major Burns?

Major BURNS. I think that is essentially correct; yes, sir.

Mr. BUTLER. Then, Mr. Chairman, we have a catalysis which in practical operation will be twice as efficient as the German catalysis. Shall we keep it idle any longer?

Now, that is not all we have learned about the fixation of atmospheric nitrogen. We have learned how, when redesigning that nitrate plant No. 1, to change it in other important respects so as to make it the best Haber process plant in the world. Since the war there has been built a small Haber process plant at Syracuse, N. Y., a private enterprise, by the company that tried to help us build this plant. They learned enough about the German method since the war that they have built a successful Haber process plant, about a 10-ton capacity plant at Syracuse, and it is now operating, and operating successfully.

Senator KENDRICK. With steam power?

Mr. BUTLER. Yes; but that plant is not as efficient as this plant No. 1 will be when we have put these improvements in it, because we have learned how to get rid of the coke and water method of getting the hydrogen out of the water by passing water air over heated coke. That is the method Germany uses; but it is not as good as the electrolytic method. She has coal, but she has no electricity.

When we redesign plant No. 1 we will take out the coke and water process and put in an electrolytic cell that has been developed by the Bureau of Ordnance, War Department, since the war; it is to-day the largest and the most efficient electrolytic cell in the world. Up to the time—what was the largest cell, Major Burns, in existence when you built that 10,000-ampere cell?

Major BURNS. I think it was a 250-ampere cell.

Mr. BUTLER. A 250-ampere cell was the largest successful one that had ever been built for using electricity for this purpose. The Ordnance Bureau has built one 10,000-ampere cell that is a decided success. The efficiency in a great project like this of a 10,000-ampere electrolytic cell for getting the hydrogen from the water is a wonderful step forward. Now, when we put in that electrolytic cell we will also make another important change in the Haber process as used by Germany and as now used in the Syracuse plant; we will put in the liquid-air method, which you can use when you put in the electrolytic cell, for taking the nitrogen from the air.

Then we will have three important improvements on the present German Haber process when we redesign nitrate plant No. 1. We will have the most efficient catalyst in the world, made by our Agricultural Department, considered by everyone to be, conservatively, twice as efficient as the German catalyst; we will have an electrolytic cell, developed by our Ordnance Bureau, that is the most efficient one in the world, using electricity to take hydrogen from the water; we will use the liquid-air process, which you can use when you use the electrolytic cell, for taking the nitrogen from the air. We will tie the nitrogen and the hydrogen together with that catalyst, and we will have the most efficient Haber-process plant in the world. When that plant is redesigned with these improvements we will expect to be able to make nitrates in competition with the Chilean nitrates and soon to reduce and stabilize the price.

But this wonderful art is in its infancy. We would not be discouraged if we failed to make nitrates cheaper than Chilean nitrates the first day. The way to learn to walk is to walk. The way to learn to make these nitrates cheap is by doing it, not by sitting down and waiting for somebody else to do it, for then they will keep the secret from us, both in peace and in war. No people in the world have greater capacity for inventive genius and for improvement than we have; if we direct our attention to the development of this art, we will accomplish the result desired.

Now, under this proposal we will redesign those plants with these three important improvements to begin with. We will employ the best experts in the world to do this work and then to run these plants. We will also have a research plant there, where our own experts and the experts of the War

Department and of the Agricultural Department will be cooperating with us in developing this great art. We will be giving our whole time to this thing, so nobody in the world should be able to outstrip us in the improvements for making cheaper nitrogen. It is certainly within the realm of possibilities to make nitrates cheaper than Chilean nitrates at an early date. It is within the realm of probabilities that it will be done within the next few years. Under these conditions improvements move fast. The incentive for getting nitrogen from the air is so great that we will wake up some morning and find that further improvements have been made in the Haber process which will decrease the cost 25 per cent or 33½ per cent or 50 per cent, and if we don't do it somebody else will. Indeed, we are on the edge of this most wonderful development, which means so much to civilization.

Senator KENDRICK. Is it not your opinion that in all probability within a period of 5 to 10 years, with the Government operating this plant economically, we will say, with the secondary power of that dam, they will save in one year in cost of fertilizer to the farmers of this country the entire investment in the dam at Muscle Shoals?

Mr. BUTLER. Senator, that is a very conservative statement. It is possible and even probable that we can do better than that if we devote this whole project to this one great purpose.

Senator KENDRICK. I will say this right here: That after looking at the perfectly wonderful character of the initial improvements made at Muscle Shoals, I have been unable to see how any good business man could even for a moment consider a plan of junking that property.

Mr. BUTLER. To my mind it is a shocking suggestion. Every consideration for "nitrogen preparedness" for both peace and war condemns such a proposition as most unwise.

Senator KENDRICK. Well, in the interest of preparation for war—of course, war seems remote now, but it seemed remote when the war opened.

Mr. BUTLER. It seemed as remote a year before it came as it does now.

Senator KENDRICK. I for one did not believe they were going to fight after they commenced to kill each other over there.

In the interest of preparation for war and in the interest of the increasing need—not demand necessarily, but the need—for this fertilizer, the Government ought, with the impetus it now has, to proceed to develop that plant and show what can be done.

Mr. BUTLER. It should be done, even if we did not need the nitrogen for fertilizer, as a matter of preparedness for national defense. We were forced to rush up these plants during the war to get enough nitrogen for explosives alone. During the war our Government preached to our people that the making of biscuits was just as important to win the war as the making of bullets, but we were forced to "make bricks without straws," because we had no nitrogen left for agriculture. In modern warfare the country that will finally win, other things being equal, is the country with the greatest resources and the greatest wealth; it is the country which has the last pound of beef and the last pound of flour that will win the war.

We are not now producing what we should produce in this country. We are letting our wealth producers waste their time, energies, and money on a starved soil, producing half what they should produce, for the want of enough nitrogen. We are using to-day only one-quarter of the nitrogen on our soil that Germany is using. We are using only one-quarter of what England is using. We are using not even half as much as Italy and France are using. We are starving our soil and paralyzing the energies of our people. We can't make two blades of grass grow where one is growing now unless we put more plant food into the soil. The most important and the most expensive element of plant food is nitrogen. We must have more of it, and we must be able to get it cheaper. Even the richest parts of our country are now waking up to this need.

Take Senator Ladd's rich country. Twenty-five years ago I looked down Red River Valley in that wonderful wheat country, the wheat just ripening; it was the most beautiful sight I ever saw; it was made without fertilizer then. Nature has stored up there from the beginning of creation a great supply of plant food so that they could produce those wonderful crops of wheat without using any fertilizer. I might put a thousand pounds of fertilizer on the best soil I have down in North Carolina and I could not even then produce such wheat. But to-day that rich valley can produce only about half as much wheat per acre. Is not that about true, Senator Ladd?

Senator LADD. That is true.

Mr. BUTLER. And now, Senator, you were down the other day in my State, the eastern part of the State, and saw our soil, in which nature has put practically no nitrogen.

Senator LADD. Yes.

Mr. BUTLER. You saw how white it looked. It looks even whiter now than it did before the war. We were struggling before the war to nourish the soil, buying what fertilizer we could and turning under green crops so as to make humus. We were changing our white sandy soils to a dark and loamy soil by adding nitrogen each year. But it looks whiter now than it did before the war. Why? Because we could not get enough nitrogen. So to-day we need nitrogen more than before the war, but we are not putting it into the soil, because it is too scarce and the price is too high. We used last year in the whole country only 175,000 tons of nitrogen for fertilizers, while we should have used at least four times that amount. Even the small country of Germany used last year 500,000 tons for fertilizers. The needs for nitrogen, even in the rich Northwest, will grow greater each year. With the whole Muscle Shoals project devoted to the production of nitrogen we will not produce as much as this country needs for fertilizer alone.

In the face of these conditions I can not believe that Congress will scrap Muscle Shoals or sell it at scrap prices to parties who will take this great property and use it all or nine-tenths of it for private manufacturing for private profits. That would be slapping agriculture in the face while it is crying for nitrogen, and it would be giving a subsidy to private parties to compete with other manufacturing concerns. Now, to do nothing would be almost as bad. I have heard it suggested that we had better let it go over a year, because it is too big to act on in a hurry. It is too big to let it go over; the need for action is too pressing.

I want right here, as a citizen, to urge with all possible earnestness that you do not allow this session of Congress to pass without putting that great water power and that large investment to work to carry out the purposes declared in the national defense act. If you do not think that the Engstrom proposal is the most efficient way to accomplish that purpose, then, in heaven's name, pass Senator Norris's bill and have the Government do it. Somebody should do it. This thing needs greatly to be done. It affects not only the farmers but it affects every consumer in America as well. And, besides, it will affect our national safety in the next war, as it did in the last. It is inconceivable that our Government will scrap this great property and refuse to go forward with the work of "nitrogen preparedness." It is equally inconceivable that you will sell this valuable property at scrap prices and turn over this great water power to a private monopoly for private gain, with only one-tenth of this power at best used in making nitrates and fertilizers. Such action would mean the robbing of agriculture of all chance to get an adequate supply of cheap nitrogen, the robbing of the people and the industries around Muscle Shoals of a chance to buy light and power at a reasonable price or at any price, and also it would mean the granting of a Government subsidy to a private monopoly in competition to all other American citizens. Such a use of public money is indefensible from every standpoint.

With that preliminary statement, Mr. Chairman, I will now take up the proposal: The first paragraph of the proposal provides for the formation of a corporation to operate this property under the lease. There are to be seven directors, two of them are to be appointed by the Government, one by the Secretary of Agriculture, and one by the Secretary of War. It seemed to us eminently proper, from our standpoint and from the Government's standpoint, that there should be some one representing the Government sitting on the board of directors, not only to have the right to see and know what we were doing, but also to advise with us as to what to do. The Government has experts, who should sit on the board of directors of any company that handles this great project, and we have invited the Government to furnish them.

Paragraph 2 simply covers the designation of the property that is to be leased for 50 years. As this proposition was first written and submitted to the Secretary of War and transmitted by him to the Congress, we included the Warrior steam plant in the lease. That is a very desirable property to have in connection with this lease; being at the coal mines it is the cheapest power we could get to operate these nitrate plants and do construction work until we finish Dam No. 2. It would be most desirable for that reason.

Senator KENDRICK. Right in that connection there, you have excluded it by your amendment?

Mr. BUTLER. We have excluded it.

Senator KENDRICK. I wanted to ask why you have included the transmission line if you do not have the plant?

Mr. BUTLER. The transmission line will be very useful under this lease, because we will want to tie up this property to the best customer for the excess power which we will have to sell. It is now tied up with the Alabama Power Co., but we want the right to remove it or to keep it where it is. The transmission line belongs to the Government absolutely. There is no mixed title there. We want the right to either keep it there or remove it where it could be used to the best advantage of our company for this lease. We have excluded the Warrior plant because of the difficulties and the delay that the Government might have in securing a title—if there was litigation about this matter. We have amended the proposal so there would be no entanglements and no delay in proceeding with the development and operation of this project. But if it is possible to put it in this lease, without delay and litigation, we still want it.

The CHAIRMAN. Well, Senator Butler, do you think it is possible to put it in without delay and litigation?

Mr. BUTLER. I am afraid not.

The CHAIRMAN. I think we ought to face these things as they are and not as we would have them. I can see the importance of having it in and including it, but after looking it over and examining the intermixture of the property down there, it seems to me an impossibility to divide it. If there is a way to divide it I would like to have somebody explain it.

Mr. BUTLER. We have eliminated it from the lease for that very reason, though it would be most desirable to have it in the lease.

The CHAIRMAN. If we were able to take it over it would have to include the coal mines there, would it not?

Mr. BUTLER. Yes.

The CHAIRMAN. In other words, you would not want the plant without the coal?

Mr. BUTLER. Certainly not.

The CHAIRMAN. It would be a physical impossibility, really, to divide the property, or the title to it.

Mr. BUTLER. It would be a matter of the Government buying the Alabama Power Co.'s interest.

The CHAIRMAN. Either the Government must buy it or they must buy it.

Mr. BUTLER. That is all there is to it. Either the Government must buy it or they must buy it.

The CHAIRMAN. It takes two to make that bargain?

Mr. BUTLER. We have given up that most desirable plant in this lease, because of the danger of delay by disagreements or by litigation. Therefore, it was necessary for us to amend paragraph 4 to include an increase of capacity in steam plant No. 1 and steam plant No. 2 at Muscle Shoals. If we are not to have the Warrior plant, we certainly will need some more power, and it can easily be furnished, because steam plant No. 2 at Muscle Shoals is designed for 90,000 horsepower; no; I think it was 90,000 kilowatts, was it not, Major Burns?

Major BURNS. It was designed for 90,000 kilowatts, with boiler installation for 90,000 kilowatts.

Mr. BUTLER. Boiler installation for 90,000. We have now installed the electrical machinery for only 60,000 kilowatts. Is that correct?

Major BURNS. That is correct.

Mr. BUTLER. So we have a plant designed for 90,000 kilowatts of power, with the foundation, buildings, and boilers already there for that capacity; it just needs the 30,000 kilowatts electrical machinery added to double the capacity of that steam plant.

Senator HEFLIN. You do not mean that if the Government should accept Mr. Ford's offer or the Alabama Power Co.'s offer for Gorgas plant we would have any right to take those private coal mines away from people around there and turn them over with it, do you?

Mr. BUTLER. The Government or the lessee of Muscle Shoals would have to get the coal from the owners on the best terms they could.

Senator HEFLIN. Certainly. Would not Mr. Ford have to buy his coal from these coal miners there, and would not the Government have to buy it? I understood you, in response to a question by the chairman, to say that if we took the Gorgas plant we would have to take the mines also. What right would we

have to take private coal mines or private individuals unless it was done for an emergency purpose?

The CHAIRMAN. Senator, the Gorgas plant would be no good to anybody unless it had the coal mine there with it. That is the reason it is an advantageous proposition, because it is right at the mouth of the mine.

Senator HEFLIN. That is what I am saying; but what right have we got to take those mines? Would not anybody who got that plant have to buy the coal from those people who own the mines? What right have we, under the law, to take those mines?

The CHAIRMAN. I see the point you make. You would buy the coal instead of buying the mine. Suppose the owner of the mine would not sell us the coal. Then, what good would our plant be? Would we not be at his mercy? If we did not own the coal mine itself, they could hold us up, because we could not get coal anywhere else very well.

Senator HEFLIN. It is true; but they make money from their operation of the coal mines.

The CHAIRMAN. I should think so; but it is rather human nature for some people when they get a chance to hold up an individual, even the Government. They do not hesitate when they have the opportunity.

Senator HEFLIN. Suppose you and I own the coal mine, and we sell coal to various people of the State. What right would the Government have, if it sold that steam plant to a private individual, to sell my mine and yours to a private individual?

The CHAIRMAN. I think that is one of the legal difficulties involved in this proposition, and a very serious one, to my mind.

Mr. BUTLER. If the Government bought the Alabama Power Co.'s interest and leased it to us, we would have to get the coal just as the Alabama Power Co. gets it, to operate it. Of course, that would be one of the problems we would face.

Senator HEFLIN. I don't know but the Alabama Power Co. owns some mines there itself.

The CHAIRMAN. It owns that mine that supplies the coal to operate the Gorgas plant. They own all that land, as I understand it. Of course, I never looked up the title to it.

Mr. BUTLER. They own some coal, which they are now using to run that plant. I know that.

The CHAIRMAN. The mine is right there. I went into the mine when I was down there, and it is like going into a submarine. I don't care to go into another one.

Mr. BUTLER. Do you understand, Senator, that most of the coal around there, outside of what the Alabama Power Co. owns, is scattered, with ownership in a number of different individuals?

Senator HEFLIN. Yes.

Mr. BUTLER. It is just a question of bartering with them and making contracts both to buy their coal and to sell them light and power?

Senator HEFLIN. That is my understanding. I saw some gentlemen that said, "We have got mines here that are served by this Gorgas plant, and if you dispose of this plant how are we going to get service?"

The CHAIRMAN. That is, their power?

Senator HEFLIN. Light and power.

The CHAIRMAN. To work the mines. There is no doubt about that. There are other owners there of other mines in that vicinity, that get their power from the Alabama Power Co. to operate their mines.

Senator HEFLIN. I said to him, "I suppose whatever disposition is made of the Gorgas plant you will continue to get your light and power from it."

The CHAIRMAN. If we got the thing, and the lessee got from us the Gorgas plant, which included the mine that supplies it, there would be one of the legal difficulties that would arise, because I presume they have made contracts to supply other parties with power there to operate their mines, and they themselves would be liable to damages. Somebody would have to pay those people their damages.

Senator HEFLIN. Whoever gets that plant, these people ought not to be deprived of the light and power that they are now getting out of the plant.

Mr. BUTLER. The transfer of the plant would carry those contracts, unquestionably; the lessee or the Government would take it subject to those contracts.

I understand there is an abundance of coal around and above Muscle Shoals on the river. With the opening of this river for navigation the coal question will solve itself.

The CHAIRMAN. Senator Butler, for the benefit of members of the committee who were not down there, let me say that this coal supply over at Gorgas on the Warrior River can not be utilized. The coal over there can not be utilized at Muscle Shoals unless you ship it by rail. It is on a different watershed. There is no water transportation, no matter how much we improve the Tennessee River.

Mr. BUTLER. Elsewhere, up the river, I mean.

The CHAIRMAN. Elsewhere you could, but you can not get it from those coal fields around Gorgas.

Mr. BUTLER. There are other coal supplies much nearer Muscle Shoals than that coal supply at Gorgas. If we cut out the Gorgas plant that coal cuts no figure in this proposition. We could buy coal up and down the river.

The CHAIRMAN. That is a question we have been inquiring of the witnesses, and nobody has given us any definite information on it. It is quite important if we do not get the Gorgas plant to have some coal on the Tennessee River where we can utilize the transportation facilities of that stream to get the coal up to Muscle Shoals. Now, do you know of any coal along the Tennessee River that can be used?

Mr. BUTLER. I am sure there is plenty of good coal up the river. Major Burns, has not the Ordnance Department gone into that?

Major BURNS. I would like to say, Senator, that Colonel Barden very definitely stated in his testimony that there was coal along the Tennessee River that would be reached by the improved navigation facilities.

The CHAIRMAN. Where?

Major BURNS. He very definitely stated there was a supply of coal in the upper Tennessee that could be used for the steam plant.

The CHAIRMAN. It is a very important point, because the reason everybody wants to maintain the Gorgas plant is because of the cheap power from coal. That country there at Gorgas is all filled with coal everywhere up and down the Warrior River, but there is no way to get it over to Muscle Shoals by water transportation, and that makes it expensive, unless you would ship it down the Warrior, through the Gulf of Mexico, up the Mississippi and Ohio and Tennessee, which would be, of course, too far.

Mr. BUTLER. Of course by water transportation coal can be brought up the river cheaper than it would be to transport it by rail from Gorgas, but when that river is opened to navigation there are many places up the river where we could get good coal. I am sure that the Geological Survey will confirm this statement.

The CHAIRMAN. Of course the desirable thing is to get the coal as close as possible to the Muscle Shoals, even though it is transported by water transportation.

Mr. BUTLER. We satisfied ourselves on this coal question up the river before we decided to eliminate the Warrior steam plant from this lease. Besides, as we develop this Muscle Shoals project the necessity for coal will diminish gradually; the building of storage reservoirs on that river will lessen the need for coal. Storage reservoirs is an engineering and an economic question of no little importance, and this is why we have thought it desirable to secure the greatest engineers that we could find anywhere to solve it. We must get all the water possible to do the work. When we can impound the water up the headwaters of this river and its tributaries so as to get over that low-water period the coal question gradually vanishes. If we make the progress we expect in developing this river, we can build many other nitrate plants and run them by the power from other dams and storage reservoirs. That is the way to make cheap nitrates.

The CHAIRMAN. Of course I think it ought to be said at the present that is rather an unknown proposition. We do not know what the possibilities are, even.

Mr. BUTLER. We know enough about it to know that it can be done. It is a question of economy to be solved by engineers.

The CHAIRMAN. Of course there is no doubt but what it can be done, but even when you come to do it the question arises at once as a financial proposition, Will it pay to store this water?

Mr. BUTLER. It would not pay any private individual, but the Government can afford to do it as a perpetual investment. When you build a storage dam it is built forever—a perpetual investment. Think of the potentiality of this

water stored, to be let out in the dry weather, to make secondary power into primary power, and thus save forever the enormous cost of coal. It is a matter of such enormous importance that the Government can afford to do that to carry out most efficiently the purposes of the national defense act. I say to you frankly that if we have this contract we will soon be camping on Congress with the engineering data that will convince you about the wisdom of building storage dams.

The CHAIRMAN. Senator Butler, I do not think there is any doubt but what when we consider it in its broadest aspect, as the Government ought to consider it, you can not get away from the storage proposition, even though it would be quite expensive, because when you come to amortize a proposition—

Mr. BUTLER. Forever.

The CHAIRMAN. And spread it over 10 years and then amortize it again and spread it over a hundred years you have almost eliminated the cost.

Mr. BUTLER. This will be spread over a thousand years and more.

Senator KENDRICK. Then would it not serve another great beneficial purpose in reducing the danger and loss by floods?

Mr. BUTLER. Certainly. It would largely remove the danger from floods, and it is the only way to remove it. And it will conserve the flood waters and make them do constructive instead of destructive work, and also, of course, make navigation more reliable. To thus harness and utilize this water will justify the expenditure of almost any amount of money.

Senator KENDRICK. It is easily believable that the saving of damage caused by floods at times would amount to the cost of the dam.

Mr. BUTLER. That is entirely probable, and when we also consider the valuable use this stored water will serve in the increased water power for the dry periods, it becomes of such importance as to justify the cost.

Those are things that we intend to have our engineers to work out and place before you if we are given this lease. It is a part of the program of development which we have in mind, as you will see from the wording of our offer.

It will also be noticed at the end of paragraph 4 that we do not require the immediate building of Dam No. 3. We do that because it will make the cost very materially less to start with, and besides, we want to get that Haber process plant (No. 1) redesigned with the three improvements which I have mentioned and try it out before building the nitrate plant at Dam No. 3. It would not be justified at this time for navigation alone. In the next place, having those two nitrate plants there and Dam No. 2 one-third finished, the common-sense business thing for the Government to do is what you and I would do as private individuals if it were our own property. We would finish that dam, and we would redesign both those nitrate plants and put them to work as soon as possible. We would also work out other improvements in the process through our research plant, and then, just as quick as we were sure of success in the making of cheap nitrates, we would build Dam No. 3 and put up a new nitrate plant by the most improved methods that we had found. In truth, Mr. Chairman, by the time we can finish Dam No. 2 and by the time we can get these nitrate plants equipped and in operation, we expect to have made such developments as will justify the building of Dam No. 3 and nitrate plant No. 3 at once, because if we can show you that we are making nitrates cheaper than Chilean nitrates you are going to authorize us to make more of it. Indeed, we can not make at those two plants one-half of the nitrogen that this country needs for fertilizer alone. Instead of scrapping one of them, we should run both.

We used last year about 175,000 tons of nitrogen in this country. We ought to have used more than twice that much. Not one pound of that came from the air. About half of it came from coke ovens, and the rest of it from Chile. We used all we could get from the coke ovens, and we used all we could afford to buy from Chile. We used last year only 5,000,000 tons of fertilizer. The Agricultural Department says we should have used 10,000,000 tons. In another 10 years we will want 20,000,000 tons.

Senator HEFLIN. How many tons do you figure we would be able to produce at Muscle Shoals?

Mr. BUTLER. By running both plants at their full capacity we would produce about 230,000 tons of nitrogen in the form of ammonium sulphate, and that will make something over 2,500,000 tons of fertilizer, with the average amount of nitrogen now being put into fertilizers.

Senator HEFLIN. I notice you say in your offer, "It is further agreed that the lessee shall sell all nitrates and fertilizer compounds produced by the plant

at prices and on conditions and terms approved by the Secretary of Agriculture."

Mr. BUTLER. Yes. We propose to submit a schedule of price and method of distribution for approval.

Senator HEFLIN. That would give the farmers of the country an opportunity of knowing about what it would cost to produce fertilizer?

Mr. BUTLER. Yes.

Senator HEFLIN. And it would have a stabilizing effect on the price, and don't you believe that would mean a saving of \$100,000,000 to the farmers of the United States of America?

Mr. BUTLER. Of course it is bound to stabilize the price, and it will save every dollar of that amount.

Senator HEFLIN. That is what I say.

Mr. BUTLER. Chilean nitrates would be sold at the price we sold our nitrates, or they would not sell at all. The same as to complete fertilizers.

Senator HEFLIN. Would not that, in your judgment, then, be a saving of \$100,000,000 to the farmers of the United States?

Mr. BUTLER. In my opinion it will save more than \$100,000,000.

Senator HEFLIN. You think a hundred million is a very conservative estimate?

Mr. BUTLER. Yes; and the amount saved will be greater each year.

You will notice that we put into that paragraph also the words, "Under rules and regulations of the Secretary of Agriculture." I tell you frankly we are going to submit to the Secretary of Agriculture a schedule of sale under which we are going to sell these nitrates without mixing them into a complete fertilizer, as far as he will let us. The Department of Agriculture has been trying to teach our farmers not to buy mixed fertilizer, but to buy the ingredients and mix the fertilizer themselves. There is an enormous saving in buying the ingredients and mixing your own fertilizer. You get rid of the cost of mixing, and you save the freight on the filler, which contains no plant food. There is no sense in our company wasting our energy and taking our time in mixing fertilizer, when we ought to be devoting all our time to making cheap nitrates, which is the important thing. So we will ask the Secretary of Agriculture to let us offer these nitrates, ask the farmers to buy the other ingredients, and mix them themselves. Further than that, we will ask him to let us offer the nitrates to anybody—to the fertilizer companies as well as the farmers, and at the same price—because if there are farmers who will not mix their own fertilizers, but want to pay somebody else to do it, then let them pay the fertilizer companies. If the fertilizer companies will do it at a reasonable price, then let them do it, and let them go on and run their business at a reasonable profit. The Agricultural Department wants to teach our farmers to mix their own fertilizers, and the most progressive ones are now doing it. We shall offer to sell the nitrates without mixing them. But we will mix some, if required by the Secretary of Agriculture to do it.

Senator HEFLIN. In other words, the farmer could then pay the freight upon the ingredients, whereas if you would mix it he would have to pay the freight on 4 or 5 tons, as against 1?

Mr. BUTLER. Certainly. Then, too, he has got to pay some one a good profit to mix it. The farmer who mixes his own fertilizer saves one-fifth to-day of his fertilizer bill. The wise farmer buys these ingredients and then makes a mixture to suit each crop and each kind of soil.

It is like a prescription for each disease, not the same prescription for all of them. We wanted to be able to file with the Secretary of Agriculture our schedule, but we ask for his approval of what we do, because we want the Government cooperating with us for what is the best for the farmer. So we have provided in there that dam No. 3 shall be built as soon as there is need for it, and a new nitrate plant, by the most approved methods, shall be built, and we have put it that it shall be in the same relative capacity as the present dam No. 2 and the other plants, because our whole proposal is based on the division of costs between the Government and the lessee on the relative proposition of the power and the output of the nitrate plants, and so we put in that condition, so that if the Government wanted more of the power used than is then under the present dam, that is subject, then, to a new agreement or condition.

In paragraph 5, "Locks and lifts," we offer to construct them at cost, and we offer to donate, in another paragraph, all of the power that is needed to operate them.

Paragraph 6, Senators, is very important. I will read it in full:

"6. *Manufacture of nitrates.*—When the two nitrate plants now a part of the property, which plants have an estimated capacity of 120,000 tons of ammonium nitrate per annum, have been redesigned and reconstructed as herein provided to manufacture such nitrates as are needed for commercial fertilizers, fertilizer compounds, or mixtures as approved by the Secretary of Agriculture, the lessee agrees to operate said plants under the following conditions: As soon as adequate hydroelectric power generated at Dam No. 2 becomes available lessee will commence to operate both plants and will continue such operation to the capacity they can be operated, after deducting operating expenses, from the receipts of the sale of"—

What we have done, Mr. Chairman and Senators, is to work out here a scheme for this plant to finance itself. We start on the theory that we can not make nitrates at first at a cost as low as the present selling price of Chilean nitrates. Every witness who has appeared before this committee or the House committee has said you can not commercially make these nitrates at a profit until we learn to improve the present processes for the fixation of atmospheric nitrogen. That has been the story, without any deviation. Now, we will accept that as true; then the only way that the Government can carry out the purposes declared in the national defense act is by subsidizing the making of nitrates until you can make them without losing money. That is what the Government did during the war. It subsidized the making of nitrates just like we will subsidize our merchant marine. Why? We say we need a merchant marine. We have got to sell our products to the rest of the world, and it is to our interest to do it under the American flag, and we can not do that at a profit, and therefore we will subsidize it for the good that will come to all our people. If it pays us to subsidize our merchant marine, then there are tenfold the reasons why you should subsidize the making of nitrates until we can learn to make them at a profit.

Instead of asking Congress, therefore, Mr. Chairman, to appropriate directly to subsidize the making of nitrates, we have worked out a plan to sell a part of this power and to use a part of the proceeds to make the plant finance itself. It will not take all the power produced at Dam No. 2 to run these nitrate plants. What we propose to sell is the excess power not needed to run these two nitrate plants. We will use a part of that money to finance the making of nitrates at a loss, but when we get where we make nitrates at a profit, then we will pay that money into the Treasury of the United States as rental on the lease.

The CHAIRMAN. That proposition is involved in paragraph 6 that you are considering now?

Mr. BUTLER. Yes.

The CHAIRMAN. It is difficult, Senator Butler, I think, to understand just what you mean on the thing you are discussing in your proposed contract. You say here (this is on page 4, about the middle of the top paragraph there), "as soon as adequate hydroelectric power, generated at Dam No. 2 becomes available, lessee will commence to operate both plants and will continue such operation to the capacity they can be operated, after deducting operating expenses, from the receipts of the sale of."

Then you tell what you are going to sell. Now, if after you made those sales, and deducting from the proceeds the operating expenses, there was not anything left, you could not operate the plant under that provision, could you?

Mr. BUTLER. Of course not, but that is not a supposable or possible proposition. We will operate—

The CHAIRMAN. To what extent is that a supposable or possible proposition? It does not mean, does it, that you are going to operate both of those plants to the full capacity, as at first blush one might get the idea you intended to do by this language?

Mr. BUTLER. We will operate to the limit of the fund thus created. It will work out practically this way: We propose to create a fund for financing the manufacture of nitrates, and by the sale of excess power only about half of the power at Dam No. 2 will be required to run these plants, and the other half we will sell. We will sell these nitrates and we will also sell the by-products not needed for fertilizers. This will create a large fund to be used as set out in subsection (a), (b), and (c) of paragraph 6, and this fund will grow larger each year. But we have considered the possibility of this fund not being large

enough in the beginning to run both of these plants at their full capacity, so we have added subsection (d), which is as follows:

"In the event said fund is not sufficient to operate said plants continuously, lessee will contribute to said fund for said purpose 20 per cent of its gross receipts from sale of power while such condition exists."

We do not expect to have to make such contribution very long, but we agree to do it, no matter how long it is required. Besides, a provision of this kind is the most effective way to cause the lessee to operate the plant in the most economical manner and to exert every effort to hasten the time when we can make nitrates at a profit. If we can do what we believe we can, that section is not going to cost us much money, but it may cost us a great deal.

The CHAIRMAN. You are going to deduct operating expenses from a fund?

Mr. BUTLER. Yes.

The CHAIRMAN. And you are going to operate as far as what is left will permit you to operate?

Mr. BUTLER. Yes.

The CHAIRMAN. And you will deduct from a fund the operating expenses, and that fund is going to be made up first of the sale of nitrates and fertilizer compounds—

Mr. BUTLER (interposing). Yes. It does not come in that order, but that is the way we wrote it. The first thing that comes will be the sale of power.

The CHAIRMAN. Another item of that fund will be 75 per cent of all the marketable by-products not required for the manufacture of nitrates or fertilizer compound. I wondered what that could consist of. What would that be?

Mr. BUTLER. At present it is not a very important item, but it will develop to be a considerable source of revenue before the end of this lease. There will be some revenue from the sale of by-products from the beginning, and in a few years we will be able to sell oxygen, which we can not sell until certain patents, which the Government has the right to use there only for the purpose of making nitrates, shall expire. We will have oxygen to sell from the beginning, but we are under contract not to sell it during the life of the patents. Those patents run out in 1931, do they not, Major Burns?

Major BURNS. I think it is in 1931 that those patents expire.

Mr. BUTLER. In nine years the patents will run out, and that will give us the right to sell every pound of oxygen produced. To-day all the oxygen left from water we throw away when we take the hydrogen from the water; and the oxygen left from the air we throw away, when we take the nitrogen from the air.

There will be other items, including carbide, as I said before. There is always some by-products.

The CHAIRMAN. In making carbide, for instance, you would not be manufacturing any oxygen, would you?

Mr. BUTLER. No.

The CHAIRMAN. What I mean is you would not come into conflict with any patents?

Mr. BUTLER. No. There are no patents in the way except as to oxygen.

Senator HEFLIN. What would you do with plant No. 1 at Muscle Shoals?

Mr. BUTLER. We would redesign it and put all the improvements that would need to be put in it. There are many changes which would have to be made. You would have to very largely rebuild it, because we will not only put in the new catalyst that Major Burns has described, which was an absolute failure in the present plant; but we will tear out that coke and water process for getting the hydrogen from the water and put in the electrolytic cell, and we will take out the machinery and process for taking the nitrogen from the air and put in a liquid air process. It would mean very largely rebuilding the plant to make it the most effective plant in the world, and we would use all of the means we know of up to date.

Senator HEFLIN. What did that plant cost?

Mr. BUTLER. It cost, in round numbers, offhand, about \$13,000,000.

Senator HEFLIN. How much of that value could you save in reconstructing it?

Mr. BUTLER. It is difficult to say, but we know that many changes will have to be made, and the estimated cost runs from \$1,500,000, the lowest estimate, to \$4,000,000, the highest estimate. General Williams and Major Burns place the figure at about \$4,000,000, and we believe that it can be done for that amount or less. The greatest defect in that plant when it was built was the want of an effective catalyst. But in redesigning it now, we will tear out the coke and water apparatus for separating the hydrogen from the water, which

is now being used by Germany and also by the small plant at Syracuse, N. Y., and put in the electric apparatus for doing this. We will put in the large electrolytic which has been developed by our War Department since the war, which is the most effective agency to-day known for securing hydrogen by electricity. We will also take out the apparatus for taking the nitrogen from the air and put in the liquid-air method. This, with the new catalyst, will not cost more than \$4,000,000; and that is the outside figure.

Senator HEFLIN. Which would make the Government's expenditure not over \$17,000,000?

Mr. BUTLER. Yes; including the war cost and everything. Then we would have a plant that would be the last word in the art and the most efficient plant in the world. The Haber process is the best and cheapest, and this will be the best Haber process plant in existence. Therefore we will be able to make nitrogen for fertilizers at Muscle Shoals cheaper than Germany or anyone else can make it to-day. Indeed, we may, with all these improvements, be able to make nitrates at a profit in this plant No. 1 from the beginning. And if so, then this plant should at once be enlarged.

The CHAIRMAN. We will have to adjourn at this time until 10.30 to-morrow morning.

(Whereupon, at 12.30 o'clock p. m., the hearing was adjourned to 10.30 o'clock a. m. Saturday, April 22, 1922.)

MUSCLE SHOALS.

SATURDAY, APRIL 22, 1922.

UNITED STATES SENATE.
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris (chairman) presiding.

Present: Senators Norris, Capper, Gooding, Ladd, Kendrick, Harrison, and Heflin.

The CHAIRMAN. The committee will come to order. You may proceed, Mr. Butler.

STATEMENT OF HON. MARION BUTLER—Resumed.

Mr. BUTLER. With reference to the coal deposits near Muscle Shoals along the Tennessee River, discussed on yesterday, I called up the Geological Survey and was informed that they have maps, Mr. Chairman, and data showing the deposits of coal along that river, and that there is an abundance of coal of good quality between Muscle Shoals and Chattanooga available for water transportation down to Muscle Shoals. So there is no question about the availability of a good quality of sufficient coal necessary to supplement the hydroelectric power with steam power, during the low-water stages to produce the maximum amount of nitrates at the least cost.

This coal will be in the position of bidding for our orders, so we will be able to buy it on the most favorable terms. Besides, we might decide, with the approval of the Secretary of Agriculture, to shut down one of these plants during the low-water period, if we could not buy this coal at a reasonable price. Under paragraph 6, we provide for a fund to be used in financing the production of the largest amount of nitrates at the least cost. It is simply a question of how best to use that fund to lower and stabilize the price of nitrates for fertilizers. If the cost of coal is too high to enable us to use it to run full time, then we should not buy it. To be able to take this position will bring the price of coal down to at least a reasonable price.

The important thing is not only to make nitrates, but to be able to make and sell them so as to stabilize the price to agriculture. Now, let us suppose that the Secretary of Agriculture shall decide that he wants us to sell nitrates at \$10 a ton less than the selling price of Chilean nitrates; and we should show him that our fund would not be sufficient to buy coal for the whole dry period to produce 230,000 tons and sell the same at that large a loss per ton, but that, if we cut out the coal bill for one or two months we could then produce 200,000 of nitrates and sell all of this amount at \$10 a ton below the price of Chilean nitrates; then the question to be determined is which policy will best produce the results desired. In short, the question will be, shall we make 230,000 tons and sell it at, say, \$5 a ton below the price of Chilean nitrates or shall we make 200,000 tons and sell it at \$10 a ton below such price? That whole question will be determined when we go to the Secretary of Agriculture to agree on the price at which we shall sell the nitrates.

This, of course applies only to the period when we have to sell nitrates at a loss. When we have to make the nitrates at a profit or at a cost low enough to be fixed as the selling price, then none of the fund derived from the sale of

power will be needed to finance the making of nitrates, and all of that fund will then be paid into the Treasury of the United States as rental on the lease. Thus you see that this proposal has been so framed that the all-important question of how to make nitrates and sell the same below cost until we can learn to make them cheaper will work itself out in a way to produce the best possible results. In short, this form of lease will enable that property to finance itself and produce most beneficent results, even under the most unfavorable conditions, which will be at the start.

I call your attention in this connection to the testimony of General Barden on this point. He estimated that the additional cost for coal during the three months of low water, when we will not have enough hydroelectric power to run the plants but must supplement it with steam power, will be \$600,000. That is an enormous item. That is larger than the total cost of running the hydroelectric plant for the whole year. Indeed, it is twice as large, for the whole cost to run the hydroelectric plant for a year will be only about \$300,000. Obviously it is of the greatest importance to cut down in every way possible that enormous coal cost. We all know that it will be prohibitive to use coal all of the time, and to the extent of time that we are forced to use it it will add enormously to the expense.

So the coal is, in the beginning, a most important question; and that is why I emphasized on yesterday the great importance of building as soon as possible at the most available sites storage dams up the river, and thus increase this hydroelectric power, which would be a permanent and perpetual investment. This is a pure business proposition—the investment in these storage dams as against the cost of coal.

When we closed yesterday we were discussing the typewritten amendment, subsection (b), under paragraph 6; but before proceeding with that, I wish to refer to the typewritten amendment at the bottom of paragraph 4, which I overlooked yesterday, and which logically comes first.

The Warrior steam plant would be very desirable to be used in connection with this lease; but, eliminating that, we have added this amendment:

"Provided, That if the Warrior steam plant is not included in this lease, then the Government interest in the same shall be sold and the proceeds used to enlarge and equip steam plants Nos. 1 and 2 at Muscle Shoals, and the balance of said proceeds shall be turned into the fund for financing the production of nitrates and fertilizers, as described in paragraph 6."

If the Government sells its interest in the Warrior plant, estimating that it could be sold for 60 per cent of the amount invested, it would get for its interest around \$3,000,000. The cost of completing and enlarging these two steam plants to take the place of the Warrior plant would be, it is estimated, about a million and a half.

Have you made any estimate on that, Major Burns?

MAJOR BURNS. I do not recall ever having made any such estimate.

MR. BUTLER. We think that is conservative. Therefore, out of the proceeds of the Warrior plant, without any appropriation by Congress, we can equip these steam plants up to date to their full capacity, adding 35,000 horsepower to their present capacity, and then have a million and a half dollars to go into this fund for financing the production of nitrates provided for in section 6.

That operating fund is made up from the sale of nitrates and fertilizers—all of it goes into the operating fund—from 75 per cent of the proceeds from the by-products, and from 66½ per cent of the proceeds from the sale of excess power not needed to run these plants. It is believed that this fund will be more than adequate, except at the beginning. To cover that period we have added subsection (d). Under this the lessee will contribute one-fifth of its gross income to that fund as long as the same may be necessary to run both plants at full capacity. We do not expect to have to do that long, yet we put it in to back our judgment and to show our good faith, and, further, as the strongest possible inducement that could be written into a contract to cause us to operate that plant just as economically as it is possible and to develop the art of the fixation of atmospheric nitrogen so as to make the manufacture of nitrates at cost, or less than the cost of Chilean nitrates, at the earliest possible date, because when we can do that we will never have to contribute, and until we do we will have to contribute.

In this connection it should be noted that lessee agrees in paragraph 15 to advance all the money necessary to operate this plant until this fund is created as provided in paragraph 6.

It seems to us, therefore, that we have put into this contract every safeguard possible for the Government, and everything that would be an incentive and a lash to spur on this company to produce the best possible results.

Also in paragraph 6, the last sentence, it is provided that when Dam No. 3 is built, that 75 per cent of the proceeds of the sale of excess power shall go into that fund instead of 66 $\frac{2}{3}$ as provided in the case of dam No. 2. We feel that we can safely do that, because the overhead expense is going to be less as we operate more dams and more nitrate plants under the same management. So when that dam is built, the amount that will go into that fund for the financing of the production of nitrates will be materially increased, and to the same extent the revenue to the Government will be increased when that fund is no longer needed to cover loss in the manufacture of nitrates.

Our proposal contemplates the ultimate development of this whole river, and the adding of new nitrate plants as fast as new dams are built, or as fast as storage dams are constructed to increase the efficiency of the hydroelectric power plants, so that when the whole 1,000,000 horsepower of this river is developed that the whole proposition will be devoted to producing nitrates and nothing else. And before that can be done there will be a demand in this country for more nitrates than can be produced by the whole development. So we have provided in another paragraph that when this river is fully developed, if there is a demand for still more nitrates, that we will build other dams and operate other nitrate plants on other streams under the terms of this lease.

Paragraph No. 7 is the alteration of the nitrate plants. It is admitted by everybody that both of these plants can be easily changed to produce the kind of nitrates needed for fertilizers, and, at the same time, hold them in stand-by condition to make nitrates for explosives when needed. It will cost about \$3,000,000 to equip nitrate plant No. 2, and it will cost about \$4,000,000 to equip nitrate plant No. 1. We will not only change this plant to make nitrates for fertilizers, but we will put in three important improvements on the Haber process, which I explained yesterday, and which will make it superior to any other plant for the fixation of nitrogen. It will be more efficient than any Haber process plant in Germany and more efficient than the plant at Syracuse; and all that can be done for \$4,000,000.

Senator GOODING. The complete plant?

Mr. BUTLER. The plant has already cost \$13,000,000, but these changes can be made for \$4,000,000. It is a small plant. The reason that it is so small is because we did not know much about the Haber process and we built it on an experimental basis, to see if we could work it out. We did not know the catalyst that was used in Germany. Indeed we knew very little about the process.

Senator GOODING. Yes. I heard you say that, Senator.

Mr. BUTLER. Therefore, we built it on a small scale, on the unit plan, with the idea of doubling or trebling it. Is that correct, Major Burns?

Major BURNS. I never heard that.

Mr. BUTLER. Well, you made it small because it was experimental.

Major BURNS. That is correct.

Mr. BUTLER. So it was purposely made small, because it was an experiment, and it is easy to double it or treble it, if it is a success.

So while it is a small plant, the thing to do is to equip it with all improvements and to prove how cheap we can make nitrates. We know that we can make them cheaper by the Haber process than by the cyanamid process. There will probably never be another cyanamid plant built in this country or in any other country in the world. Germany is not building any more cyanamid plants; all her new plants are by the Haber process. She is using some of her old plants, but she made last year only a hundred thousand tons of nitrogen by the cyanamid process, while she made 300,000 tons by the Haber process. She got only about one hundred thousand tons from her coke ovens, and that is more than we got from our coke ovens, and yet we are not making a pound of nitrogen from the air.

So we should not scrap nitrate plant No. 1, but we should redesign it and put it to work. Everybody expects the improvements in the fixation of nitrogen from the air to come through the Haber process. As soon as we show what we can do with plant No. 1, we should build more Haber process plants.

Senator KENDRICK. You have suggested right there the great advantage in the Haber process over the cyanamid process. Is there any possibility of changing the cyanamid process to the Haber process without entirely junking the original plant?

Mr. BUTLER. No. The processes are entirely different, Senator, so much so that there is no way of changing one to the other. If we do not continue to use nitrate No. 2 as a cyanamid process for making nitrates for fertilizers then it might be used to make carbide, or something else. There are a number of things you can make in a cyanamid plant. A number of them that are in existence are not going to the point of making nitrates for explosives or nitrates for fertilizer. They produce other things at various steps. Some make and sell oxygen, carbide, and so on.

The CHAIRMAN. We could not sell oxygen unless we make some kind on an agreement with the patentee of the process.

Mr. BUTLER. It will be 1931 before we can sell oxygen unless we pay a royalty on the patents.

Senator GOODING. We are not going to do that, are we, Senator?

Mr. BUTLER. Certainly we will not unless it will pay.

I have heard it suggested that Congress should appropriate the money to finish the dam, and wait until the dam is finished before leasing the property. That would be a mistake. The work of redesigning those plants should begin when the work is started on finishing Dam No. 2, in order that the plants may be equipped and ready to operate by the time we have the hydroelectric power ready. Otherwise there will be much delay. It will take as long to get the plants ready to operate as it will to finish the dam. Shall we finish the dam and then let the water run to waste while we are redesigning the nitrate plants. That will be bad business, and besides it will delay the time when we will be making cheap nitrates. This lease should be made before the beginning of the dry-weather period beginning with August. It will take three dry-weather periods to finish that dam, so if we miss this year's dry-weather period, it means a loss of a whole year. That is your estimate, is it not, Major?

Major BURNS. Colonel Barden has done that, sir.

Mr. BUTLER. Colonel Barden has, I think, pointed out that it would take three low-water periods.

Senator GOODING. How long do those low-water periods extend over each year?

Mr. BUTLER. They begin along in August and run through October. Something like three months, is it not, Major Burns?

Major BURNS. That is substantially correct. They begin in the summer and they do not end until upwards of December.

Senator KENDRICK. Do you not prosecute the work during other months, Major Burns?

Major BURNS. As I understood the testimony of Colonel Barden, there is some of the work that you would undoubtedly carry on during the high-water periods, but the big bulk of your work would be done during the low-water periods.

Senator KENDRICK. Then, your time of actual construction is confined to a period of four months?

The CHAIRMAN. No; I would not say that, Senator. Of course, Major Burns is not connected with that part of the work. He has nothing to do with the construction of the dam. They work the whole year through on the dam. There are parts of it, as I understand it, the part that is under the water, that they can only work on during low water.

Senator HEFLIN. They construct their cofferdams while the flow is small.

The CHAIRMAN. While the river is low.

Mr. BUTLER. They work the whole year, but we must have three low-water periods to do the work that must be done under water or we will be more than three years finishing the dam.

The CHAIRMAN. Yes; that is true of that part of the work. They do that during the low-water period.

Senator GOODING. Tell me what is your high tide. You have a period of flood tide, don't you, when the river is high?

Mr. BUTLER. The flood tide is in the spring. I think, around the spring equinox.

Now, if you are going to give us this lease we want you to do it before August so that we can use the whole dry-weather period this year. And if the Government is going to finish that dam, then get your engineers down there before August for the same reason. We are ready to lease the dam after the Government has finished it or we are ready to build the dam under our lease.

Senator HEFLIN. You mean you will construct the dam and the Government furnish the money?

Mr. BUTLER. Yes. We will construct the dam for the Government or we will lease it after the Government has finished it. In section 19 we offer to do it.

with the Government furnishing the money, or we offer to lease it after the Government has finished it. Somebody has got to finish it or we can never run these nitrate plants.

Senator HEFLIN. You do not suggest you will furnish the money and the Government build the dam?

Mr. BUTLER. No. We are not proposing to take over the title to this property, so that the Government will have to reclaim it at the end of 50 years by paying us for it. This is the only proposition before you which does not even take over the title to any of the Government property. We have proceeded on the assumption that the Government wants to lease this property to someone who will best carry out the purposes of the national defense act. If we are going to reverse that policy, then let us say so; and be done with it; if not, then let us proceed with it by leasing this property to someone who offers to devote the whole project to making cheap nitrates, or have the Government to do it. But, certainly, the Government should keep the title to this property.

Senator GOODING. Your thought is that the people would be best served by the Government having the ownership there?

Mr. BUTLER. Certainly. It is very important for the Government to keep control, and if it keeps control, then, why should it not keep title? This property, if operated under a lease like we propose, will be of tremendous value at the end of 50 years and will still be the property of the United States. In the meantime it will have been used to perform the greatest possible service to the public. Now, shall we follow that course or shall we scrap this valuable property, abandon a great public service, and turn it over to a private monopoly to be used for private profit? When you do that, you will be giving a subsidy to one man to compete with all other private citizens in the same line of business. I submit that such a use of public money is indefensible from every standpoint.

The important thing here before you is not who gets this lease or who gets this property, but what is going to be done with it. That is a thing of tremendous importance.

Senator KENDRICK. I think it is highly important to know just how they get it.

Mr. BUTLER. Yes; how you get it and what you are going to do with it after you do get it.

Senator KENDRICK. I agree with you in the thought that there should be no alienation of title, even conditional transfer.

Mr. BUTLER. The Government must retain the title to all of this property if we are going to get the results contemplated under the national defense act. Besides, there should be kept the strictest control over the operations of the lessee. The contract of lease should be so drawn as to make it to the financial interest of lessee to exact every effort to develop the art of the fixation of atmospheric nitrogen and to produce the largest amount of nitrates at the lowest possible cost.

We have tried, Mr. Chairman and Senators, to draw a proposed contract that would do that very thing, and I want to say right here, if we have failed in any respect in making this contract clear and positive to that end, then we are ready to amend it to make sure of such results.

Senator GOODING. Senator, unfortunately I have not been able to be with the committee during much of this discussion, but there is one question that, if you have not been asked or if you have not explained and if it is not breaking in too radically on your line of thought at this time, I would like to ask. As I understand it, you are very familiar with conditions in the South. That is your home?

Mr. BUTLER. Yes.

Senator GOODING. And you understand soil conditions down there?

Mr. BUTLER. Yes. I was born and raised on a farm and have been farming all my life. I have one of the largest farms in my State.

Senator GOODING. Your thought, as I understand it, in connection with this, is that as far as the South is concerned—and they are a mighty important part of America; we all agree to that—the greatest blessings and benefits that can come out of Muscle Shoals will come from carrying out the original idea in connection with the manufacture of nitrates.

Mr. BUTLER. There is nothing so important to the South to-day as doing that. It is also of tremendous importance to the whole country.

Senator GOODING. As far as the industrial plants down there are concerned, which is, of course, a very important question, that, after all, is small as com-

pared with the keeping up of the fertility of the soil. That is the first question that confronts every country, or should be, if it were given thought, but we haven't given, anywhere that I know of, with any degree of intelligent direction, any thought to that question. If we have, I have not been able to find it.

Mr. BUTLER. Unfortunately, that is too true.

Senator GOODING. I am unable to go to our great Agricultural Department here and find the exhaustion that takes place with the growing of different plants and crops that we have grown. They have not any such record down here. At least I have not been able to get it. So that is what you want to put on the soil—those things that plants exhaust.

Mr. BUTLER. A sufficient supply of proper plant food for the soil is a problem that I have been forced to study all my life; I have had to do it from financial reasons, as well as from an absorbed and deep-grained interest in the success of agriculture. I have had to work that problem out on my own plantation with such help as I could get from the Department of Agriculture, but largely from my own experience. Of course, they have given a great deal of valuable assistance, and I have, in my—

Senator GOODING (interposing). Yes; they have done good work.

Mr. BUTLER (continuing)—feeble way, helped to direct some of the investigations along that line, both when I was in public life and in private life; and, I am glad to say that the activities of the Department of Agriculture are broadening and are becoming of more use all the time.

Senator GOODING. I agree to that; but the one great thing in this country that we have not studied as fully as we could and should is the soil exhaustion that is taking place all these years.

Mr. BUTLER. That is one thing of very tremendous importance that has not had the attention from anybody that it deserves. I agree with you that our Agricultural Department does not seem to be fully alive to its importance.

Senator GOODING. I say that advisedly, because I have been a farmer all my life.

Mr. BUTLER. Crops can not be successfully grown on a soil unless it contains the essential plant foods, which are nitrogen, potash, and phosphorus. Nature has stored up a certain amount of these plant foods in most soils, but not always in the proper proportion for the crop you may desire to raise. The shortage must be supplied to suit the crop to be raised. But this supply of plant food in our virgin soils soon becomes exhausted and must be supplied in the form of fertilizer. The most important one of these plant foods is nitrogen. It is the scarcest and the dearest. There is no known source of sufficient supply of nitrogen except from the air. We must get it from the air or our soils will grow poorer. The soils of the South and East have long suffered for want of nitrogen. But the soil in the West is beginning to be exhausted also. Take Senator Ladd's State, which we were discussing yesterday, where they are producing to-day in the richest soil in this world only about half the wheat that they were producing 20 or 25 years ago.

Senator GOODING. Yes. I heard that statement.

Mr. BUTLER. That is because the plant food is being taken out of that soil, and it is not being put back. They are facing the proposition rapidly that unless they use more fertilizers, unless they can get cheap fertilizers to put the plant food back, they will soon be where we are in the South. The condition is a serious one, and it is facing every part of the country. The East and the South have faced it longer than the West, but the West is fast approaching it.

So we have here to-day a proposition that is vital to every State in the Union. It is basic, and our prosperity, our increased new wealth each year is measured and limited by just how much plant food we can put back in the soil and how cheaply we can put it there—not only the prosperity of the individual farmer, Senator, but the great mass of consumers.

Senator GOODING. Sure.

Mr. BUTLER. I can not go on producing food and clothing from my soil if my expenses, including high-priced fertilizers, are greater than what my products will sell for. That means higher prices to the consumer, without any benefit to me or benefit to the country. It means lesser production, which means loss and waste to everybody. It means loss even to the fertilizer companies, because we will buy less fertilizer. We used only 5,000,000 tons in this country last year when we should have used 10,000,000 tons.

Senator GOODING. I bring that out because it seems to me that there is a thought, as I gather it, to get away from that and think of this only as a

development of industrial plants in the South. There is too much of that, I believe.

Mr. BUTLER. It would be a shocking thing to turn that great water power and that large investment of public money over to a private monopoly for private manufacturing schemes. With the great mistake made at Niagara Falls it will be inexcusable to make the same blunder at Muscle Shoals. To turn this water power over to a private monopoly will not deprive agriculture of a sufficient supply of nitrogen, which is so sorely needed, but it will deprive the people and the industries around Muscle Shoals of an opportunity to buy light and power.

Take the city of Buffalo as an example. The people of that city can not buy one kilowatt of power or light now from the great source of supply at Niagara Falls. We all remember that one morning we woke up and, saw in the headlines of the newspapers that electric power and light had been transmitted 28 or 30 miles from Niagara Falls to Buffalo, and what a wonderful feat it was, because before that time we had not been able to carry it more than about 15 or 20 miles. (We have learned now to carry it 250 miles, and it will not be long before it will be carried a thousand miles. That electric current was sold for a while, but there was no restriction on the business, so that private monopoly soon began to use it for private profit in private manufacturing. Then Buffalo had to spend \$10,000,000 putting up a steam plant to make light and power, and in the most expensive way. With all that great water power there the country right in and around there is starving for light and power. If you do this same thing at Muscle Shoals you will have every farmer and every industry and all the people around within 200 or 300 miles starving for light and power. You will put them in the plight of Tantalus's condition of standing in water coming right up to his lips, yet thirsting to death because he could not get a drop to drink.

The CHAIRMAN. Do you know what they have to pay in Buffalo, the ordinary consumers, for electricity?

Mr. BUTLER. I do not.

The CHAIRMAN. Do you know what they pay on the other side of the river, in the Province, where the Province handles the electricity?

Mr. BUTLER. I understand it is much cheaper.

The CHAIRMAN. That is the understanding I had, but I have before me here a report made by Murray and Flood, comparing the cost of electricity over there and on the American side. I have not read the thing itself, but last night I spent two or three hours reading a review of it. It is claimed, I judge, by these people that they are paying more for electricity on the other side, where the Government handles it, than they do on this side, where it is all handled by private parties. I was wondering if that was true?

Mr. BUTLER. There may be special cases under special conditions where that happens, but I doubt it.

The CHAIRMAN. In the report that I read, that was a fair synopsis of this report, they took the whole country and compared the average cost all over the country.

Mr. BUTLER. If it is so, it should not be.

The CHAIRMAN. Do you know that the people of Buffalo are supplied with electricity generated from a steam plant?

Mr. BUTLER. Yes, sir. They spent \$10,000,000 recently enlarging their present plant. It cost them \$10,000,000 to supply the power and light.

The CHAIRMAN. I am going to make some investigation of that point. I doubt the report very much.

Mr. BUTLER. The State of New York is now trying to change that condition, so that Buffalo and other people in that circle around there—

The CHAIRMAN (interposing). Will get the benefit?

Mr. BUTLER. Yes.

Senator HARRISON. I do not know what the situation is to-day, but some four years ago, and for years prior thereto, the Foreign Relations and Foreign Affairs Committee of the House investigated the question of the utilization of power at Niagara Falls, and in the consideration of that question they went into the rates that were charged on the Canadian side as well as on the American side, and the facts were at that time the rates were much cheaper.

The CHAIRMAN. On the Canadian side?

Senator HARRISON. They were much cheaper on the Canadian side than on the American side, and all the municipalities were very much interested in

the question and were protesting against the high rates they were being charged on the American side.

The CHAIRMAN. I was somewhat familiar, Senator, with that investigation, in a general way. I know what you say was the outcome of it, and that is one reason I was very much surprised when I read the synopsis of the Murray and Flood report last night, printed in a magazine, wherein it was claimed that the Canadians in Ontario were paying a great deal larger price for electricity than the Americans were on this side.

Mr. BUTLER. Of course, it now costs more in Buffalo to generate the light and power than it would from water power.

The CHAIRMAN. It certainly does if they have to do it with coal.

Mr. BUTLER. It costs more than it does to generate it at Niagara Falls.

The CHAIRMAN. It certainly does, because that is one of the greatest water powers in existence to-day.

Mr. BUTLER. If that condition exists, there is some abnormal or unjust reason for it.

The CHAIRMAN. This report, as I judge, has for its purpose the demonstration of the fact, or supposed fact, that the reason it costs more is that Ontario is a government and it is government ownership.

Senator HARRISON. Who are these people that make that report?

The CHAIRMAN. Well, they are some electrical engineers.

Senator HARRISON. May I ask you, Senator—perhaps you stated it when I was not here, but as one member of the committee I naturally, if the Government is not going to do this work, would want to know the character of the people who are making the proposal, or their ability to do the work that they propose to do, and what they have done in the past, and whether they have been successful or not. I notice that this proposal is made by Mr. Engstrum, and he proposes to form a corporation to do this work, under your proposal. You have done nothing yet toward perfecting the corporation, as I understand.

Mr. BUTLER. We have not announced our organization, but we are ready to form a corporation and will do it before this contract is signed.

Senator HARRISON. What is to be the capitalization of the corporation?

Mr. BUTLER. The capitalization will be two and a half million. That is certainly sufficient protection for the Government under this lease.

Senator HARRISON. Have you any assurance that you could sell the stock?

Mr. BUTLER. We may not have to sell any stock. We think that the proposed company can put up the necessary money. We will organize a company with a capitalization big enough to convince the Government and everyone that we have financial resources in sight sufficient to do everything we agree to do. We are not buying anything. We are offering to lease a property and operate it under conditions that would make it finance itself. We have worked out a scheme for selling a certain amount of excess power for that purpose. We can finance this proposition by the sale of excess power and make nitrates at a loss, if necessary, without making it necessary for Congress to vote a subsidy to finance the making of nitrates. We also agree to put up sufficient money to run this property until we can finance it in this way: None of us would live through the lease, probably, and therefore it is a corporation, and we have got to tie it up—but outside of the characters of the men who start that it has financial responsibility to do all we promise to do and obligate ourselves to do. We give a bond also for the faithful performance of this contract.

Senator HARRISON. How much bond?

Mr. BUTLER. Any size that the Government requires. We put no limit on it.

Senator HARRISON. Who is associated with Mr. Engstrum?

Mr. BUTLER. We have not asked the permission of any of our associates to announce the personnel of the company. We have negotiated with enough people to know that we can form a company of two and a half million and give the bond and put up the amount of money that is required under this proposal.

Senator HARRISON. I ought to know Mr. Engstrum, but I do not. What has been his experience?

The CHAIRMAN. He went into that quite fully yesterday, Senator.

Senator HARRISON. Oh, did he? All right, I will read it in the record.

Senator GOODING. Very fully.

Mr. BUTLER. The fact is that no one who has made an offer for this project is better qualified by ability and experience and in every way to develop and operate the Muscle Shoals project than Mr. Engstrum, as you will see when you read his record.

Senator HARRISON. I will read that in the record. I did not know that you had covered that.

Mr. BUTLER. I asked the permission of the committee for Mr. Engstrum to go on the stand and state briefly what his experience has been, which has been as an engineer and contractor all of his life, and his father before him.

It is in the blood, if you please. Trained engineers and contractors, and the family themselves of large means and very successful. The fact is that Mr. Engstrum himself, individually, could finance this proposition.

Now, Senator Gooding, I want right here to answer further your question, because it is basic. I feel if we all could get squarely before us the picture that you had in mind when you asked the question that we would take action on Muscle Shoals and that it would be the right action. We are blindly driving our high-class wealth producers from the country to the cities. We are starving our soil. You can not expect the men of the fiber of our ancestors to stay on farms, though born and raised there, and continue to exhaust their efforts and grind out the lives of their wives in drudgery and not make a decent living for their families; the result is we are driving whole families from the farm, the men and women who have produced the high-class boys and girls—the fresh blood from the country which has kept the cities from rotting. It has been the country-raised boys who became leaders of the next generation. We do not produce many high-class men in cities. They play out. The conditions are not of the right kind. It is the country that is the fountain spring of a high-class citizenship, which is the cornerstone of every country and the very bedrock of a republic, where we are supposed to govern ourselves. We are drying up the fountain springs of the next generation by driving that high class of citizenship from the soil. And the rate is growing rapidly; it is a matter of grave concern. If we go back and begin to quote what history shows, it sounds stale; but I tell you, Senators, we ought to stop and look square in the face what has happened to every other country that has driven its high-class farmers from the soil.

Senator GOODING. It is happening here, Senator.

Mr. BUTLER. Yes; and it is happening here faster to-day than it has ever happened in the history of any other country of the world. In what is falsely called the "Golden Age" of Roman civilization Emperor Augustus saw the growing migration of Rome's wealth producers from the *compania* and other productive districts to the cities. He saw the danger of that migration to the future glory and prowess of Imperial Rome. So he summoned Virgil, the most beautiful and persuasive writer of his time, and asked him to write a series of articles on the beauties of country life and to appeal to the farmers to go back to the soil and continue their work of the production of food and clothing and also the raising of sturdy country boys to replenish the fighting legions of the Roman Empire.

The result was Virgil's *Georgics* and *Bucolics*. But history tells us that those glowing pictures of country life, set off with all the beauties and embellishments of poetry, did not send a single farmer back to the soil and did not in the least stop the fatal migration. That was the beginning of the end of the prowess of Rome. The Emperor Augustus saw the evil, but he did not see the remedy, because he did not comprehend the real cause. The beautiful pictures of country life could not induce the Roman farmers to go back and face again a fate of unrequited toil.

Senator GOODING. I am accumulating a record of the farms abandoned in the different States of the Union at the present time. It is really appalling to see what is happening in many of them—almost all of them, as far as that is concerned.

Mr. BUTLER. Take a high-class family, a father and mother who had raised 8 or 10 children, educated them as best they could; when that father and mother passes away not one of the boys will remain on that farm. Then we have the tenant or an abandoned farm.

Senator KENDRICK. Don't you believe, on the other hand, Senator, that the chief difficulty on the farm is that the advantages in the way of compensation in the industries and in the cities particularly is claiming and are claiming the better talent from the farms every year and leaving only those who—or leaving at least a smaller and smaller proportion of men capable of making a success of farming?

Mr. BUTLER. Exactly. If anyone out of a family of 8 or 10 boys is left on a farm, it is always the one who has not got nerve and initiative enough to leave. But they all know farming better than anything else, and they would all stay if there was a decent living in it.

Senator HEFLIN. Not only that, Senator, but the price of fertilizer that the farmers have to use is so high that it is difficult to make a profit on farming operations.

Mr. BUTLER. Of course; there is the root of the trouble.

Senator HEFLIN. Take my State. In 1920 the cotton crop amounted to about 600,000 bales and brought an average price of 10 cents a pound, making \$33,000,000. The fertilizer bill that year for my State was \$20,000,000. The fertilizer bill of some of the farmers was more than they got from their crop—many of them, for I know many of them, and they are good farmers and not men who throw away their time and effort.

Mr. BUTLER. That situation, Senators, is one to-day demanding the first attention of every statesman of this country; namely, how to stop that migration from the farms. You may preach all you please, you may offer all you can in the way of palliatives, but you will never stop the migration until we make farming profitable and the lives of the wives and daughters raised on it more comfortable, and that can not be done without some decent revenue from their work. They toil 16 hours a day and get nothing but more toil and drudgery.

Senator GOODING. Drudgery all the time.

Mr. BUTLER. It is continuous toil and drudgery, and they do not get enough money to make themselves decently comfortable in their homes, with sufficient clothing and the ordinary comforts of life, to say nothing of education and self-improvement, which our civilization demands.

To-day, with our rural telephones, rural free delivery, good roads, and with automobiles, if we could only make farming more profitable we could hold and build up a great class of farmers again, the very flower of our citizenship.

Senator GOODING. With your good roads and automobiles?

Mr. BUTLER. Yes; good roads, automobiles, rural free delivery, telephones, and better rural schools are all needed improvements and, to an extent, inducements, but they are not enough. You can not keep high-class people on the farm without you can make it more profitable. That is the one thing needed.

The CHAIRMAN. It will take more than fertilizer to do that.

Senator GOODING. It will take a little more than fertilizer.

Mr. BUTLER. Yes; I know that. I have studied every question affecting the success of agriculture and have helped as far as I could in providing the needed remedies. I have spent a great deal of time recently in helping to form cooperative marketing associations. We have the farmers in my State and in many other States already organized into such business organizations. That is one of the remedies.

The CHAIRMAN. Still, that is not enough.

Mr. BUTLER. No; that is not enough. The basic, the all-important question is to first be able to produce larger yields per acre and per man and at less cost. This must be done before any of the other things count. Here the question of cheap rural credits is as important as an abundant supply of cheap fertilizer. We must have a banking system suited to the needs of agriculture, with long-time credits.

The CHAIRMAN. What have you done about the railroads? What about transportation?

Mr. BUTLER. Transportation, of course, is a question of great importance to every business, and especially to the farmer, on account of the weight and bulk of what he buys and what he sells. I tackled that question when I was a member of the State senate of North Carolina and put through the law creating our railroad commission. I also got interest reduced from 8 to 6 per cent.

The CHAIRMAN. This is all very interesting, but I think we ought to get along with this contract, Senator.

Mr. BUTLER. Yes; and the cost of fertilizer is the one thing we have before us in this Muscle Shoals matter, and it is a tremendous item. Nearly every farmer I know has had his back broken with his fertilizer bill. If it had not been for the high cost of fertilizers nearly every farmer could have come out ahead during the last two years. If you can use Muscle Shoals to reduce the fertilizer bill, say, 33½ per cent, you will put a very large percentage of the farmers on their feet who to-day are broke. So we are tackling one of the live wires going to the very root of agricultural prosperity.

Section 8 covers plans for alterations of nitrate plants. We will submit to the Secretary of War and the Secretary of Agriculture our plans for redesigning and re-forming these plants, as already explained, and to be agreed on by their experts.

Paragraph 9 is the research section. It is more important than the length of the paragraph would indicate. While the redesigning and the practical operation of these plants to make nitrate will be very useful in learning how to make nitrates cheaper, yet the operation of a research plant is the most important and surest way for this country to be the first or have an equal chance with other countries in developing this great art of the fixation of nitrogen. While other proposals before you propose to also run a research plant, but I submit that you can reasonably and logically expect greater results from a lessee operating a research plant, if he is devoting his whole time and effort to it.

If we were offering to use only one-tenth of this power for making nitrates, and nine-tenths of it for our private purposes, unregulated, certainly the making of nitrates would necessarily be a side issue, and we could not be expected, with human nature constructed as it is, to run a research plant with the same intelligent interest to produce improvements in the art, as if we were devoting our whole time to the making of nitrates and had hanging over us a contribution of 20 per cent of our income for that purpose, until we made a success of the enterprise.

The research plant will be our key joker there to make that thing a success, and I submit that only under such conditions as put out into this proposed lease, can you expect to get the best results from such a research plant.

Paragraph 10, about construction: We agree to begin the required construction there within a reasonable time, and to finish it within three years.

Paragraph 11, changes: This paragraph, and 12, 13, and 14, we put into the original proposal, when we thought we would offer to build this dam for a fixed sum. But with so much difference of opinion about its cost, we changed to the plan now proposed. We did not want to ask too much to build it, and if we offered to build it as cheap as we thought we could, we might be caught under our bond. We thought it was well to leave them, even in the changed form, because under a 50-year contract we are very much interested, as much so as the Government can be, in having this construction of the best quality and of the most durable nature, because, of course, we do not want anything to give way or break down.

Paragraph 14 provides for a representative of the Government engineers being on hand with our engineer to agree about what is to be done and how.

Paragraph 15, contains an important amendment. It reads as follows:

"The lessee agrees, however, to advance all the money that may be necessary for operating expenses until sufficient funds are received from the sources enumerated in paragraph 6; the said money so advanced to be reimbursed as soon as practicable."

Now, what that amount will be we can only estimate roughly. So we have put no limitation upon it. Under our bond and under our organization we do not expect, roughly speaking, it will require more than \$250,000 to be advanced until we will have a fund that will comply with the terms of section 6; but if it should take \$500,000 or more we are prepared to meet it. We have figured that it may take that much. It may take more, but we will form, as I said, a company with \$2,500,000 capital, so there can be no question about the necessary money to run the plant. We agree to make this thing a success, and we expect to do it, and we can not make any money for ourselves without we do. One thing is certain and that is that the plant shall run. We agree to furnish the necessary money until we can earn it from the plant, and even after the plant is going if there comes a period during the year when we can not run on the fund created, we will contribute 20 per cent of our part of the receipts from the sale of excess power to do it. We think we have protected the Government from every standpoint, and also put in every stimulus that is necessary upon the lessee, but it is open to amendment. Men, who intend to do what they promise to do, do not object to binding themselves with the greatest particularity. Therefore, we are ready to make any reasonable changes desired to carry out this proposal.

Section 16, sale of products: There we agree to sell all of the products of every kind that are made, under terms to be approved by the Secretary of Agriculture. Attention is called to the provision at the end of section 16. It reads:

"It being understood and agreed that primary power may be sold and the nitrate plants may be operated by secondary power to the extent that the same can be done to assure the best financial returns for the operation of the plant and to produce a maximum of nitrates and fertilizers under this contract."

Secondary power can be used to greater advantage in making nitrates and fertilizers, probably, than in any other way. To the extent that that can be done—with a view always of the results that we are to produce—it is desirable, because secondary power does not sell in the market as well as does primary power, and the more primary power we can sell the greater fund we create for financing the nitrates. So, up to the time when we can make nitrates at a profit, it is of the greatest importance that we should sell as much primary power as possible in order to create the largest fund for financing the loss. Of course, after we are making nitrates at a profit the amount of power we can sell and the price we get for it will determine the amount of revenue that goes into the Treasury on this lease.

Section 17, additional plants: That is the section to which I referred to a few moments ago. When this whole river is developed and there is more need for nitrates—we are in the business, we are experienced, we have a trained corps of experts—so we ask that we shall be given the opportunity, under this contract, of going to other rivers, other water-power sites, and developing similar work to supplement the million horsepower that will finally be developed at Muscle Shoals. There is nothing binding on the Government about it. But, of course, if we live up to our contract, we are the best people in the world to render that service.

Section 18, profit from nitrates: I will read that section:

"It is further agreed that when nitrates for fertilizer and fertilizer compounds can be made at a profit, or when the cost of the same has been so reduced that the funds arising from the sources enumerated in paragraph 6 are not needed in whole or in part for financing such productions as herein stated, the said funds not needed for operating expenses shall be paid by the lessee into the Treasury of the United States. When said funds paid into the Treasury shall be in excess of the amount received from sale of excess power, as described in paragraph 6, it is understood and agreed that during the period such conditions exist, fertilizers are made at a corresponding profit and the lessee shall be entitled to 25 per cent of such profit."

We feel that no one can object to us reaping 25 per cent on the profit from fertilizers when we get to making them at a profit—that is to be read in connection with another section—provided that the Secretary of Agriculture shall consent to our selling them at any figure above cost. Of course, if he does not, we get no profit. But the time may come when the Secretary of Agriculture will decide that we were making nitrates so cheap that we should sell them at 10 per cent above cost. Then we should have as a reward, if you please, for our effort in reaching that situation a share equal to one-fourth of the net profits.

It will be noted that the time when nitrates are made at a profit will be when the funds paid into the Treasury shall be greater than the amount received from the sale of excess power. That will mark a period of complete success; but it may come earlier than we expect on account of improvements in the Haber process. We may reach it within a year. Those developments in science and chemistry often come quickly; when you have a number of minds centered on one thing it is astonishing how similar discoveries and inventions come all over the world within a few months of each other. It is a most remarkable thing to see in the Patent Office how many inventions along a particular line come within a few weeks or months of each other. Some of the greatest lawsuits are as to the hour that A or B invented the same thing. To-day we have the minds of scientists in the world all concentrated on this thing—a cheaper process for the fixation of atmospheric nitrogen.

Section 19 gathers up all of the construction that we may do and that has been described above. I will read it:

"In consideration of the performance of the foregoing proposals and conditions the Government shall agree to pay to the lessee for the completion of Dam No. 2, the initial alterations of nitrate plants No. 1 and No. 2, the completion of the locks at Dam No. 2, the completion of steam plant No. 1 to a capacity of 10,000 kilowatts and steam plant No. 2 to a capacity of 90,000 kilowatts, and when required by the Government for the building of Dam No. 3 and nitrate plant No. 3 and the locks at Dam No. 3 and additional dams and nitrate plants and storage reservoirs"—

So the full development of the river is contemplated, you see—

"the actual cost of the same, respectively, together with a fee of 5 per cent on such cost in each case, in monthly payments, as per estimates of the engineers upon schedules of work performed. The cost in each case is to be determined by the lowest responsible bid resulting from a public offer by lessee and

by the contract awarded by lessee to such bidder, subject to approval by the Secretary of War. It is understood and agreed, however, that if the Government shall decide to finish Dam No. 2 that lessee will accept a lease subject to that modification of this proposal."

That language is plain. I have read it simply because the whole construction proposition is there brought together.

The only question that could arise, I take it under that, is as to whether or not the 5 per cent fee is a fair one. Now, this is not a cost-plus contract as we learned it during the war, where everything was wide open and the inducement was to make everything cost as much as possible so the 10 per cent profit would be as large as possible. Anything here has to be submitted to a public bid, and it is the lowest public bidder, and then subject to approval by the Secretary of War. So we have learned by experience that this is the way to get the best constructive talent to bid against each other and get the lowest possible figure for construction of any kind from the most responsible men, with the privilege always of turning down all bids, of course.

The CHAIRMAN. It is not the contemplation that the lessee should actually do the work, is it? He is only to let the contract to somebody else?

Mr. BUTLER. No; and for this reason: While we could organize, of course, a construction company to do that, yet there are operating in this country a number of high-class construction concerns of great responsibility and capacity, with highly equipped organizations, that are equipped with everything to do such work in the best and most efficient way, and of course in the cheapest manner. They can do the work cheaper than anyone else. But under our bond we would be responsible. We would make the subcontract with each one, and under our experts and engineers and under our direction all of this work will be done, and we are responsible for the result.

The CHAIRMAN. How much cheaper do you expect in this way you would be able to complete Dam No. 2? How much cheaper than if it were completed by the Army engineers, I mean.

Mr. BUTLER. Well, we have figured that we can do it cheaper than the Army engineers have estimated it, after the 5 per cent is paid us; but we put in that optional clause just so as not to argue the question. We are willing for the Government to finish it; there will be no profit in it for us.

The CHAIRMAN. Under your lease you would get the railroad and mixing machines and machinery, cars and engines, and would turn those over to your contractors who were successful in bidding, would you not?

Mr. BUTLER. Of course, any part of the equipment there that can be used by a contractor will come off of his bid, or would be taken as a part of it to reduce the cost.

The CHAIRMAN. For instance, the Government has 25 to 30 miles of railroad there. You would expect to get that under the lease, would you not? Your lease provides for that?

Mr. BUTLER. That road was built to be used in the necessary transportation of materials needed in the making of nitrates. Of course, we will need it and will use it under this lease for the same purpose.

Under our lease anything the Government has there will be utilized to the greatest extent that it can be used economically in the construction operation of the plant.

Senator KENDRICK. Senator Butler, my attention is called to the language here in section 19, and I find it difficult to determine from the paragraph as it reads where the right to limit construction lays, whether it is with the Government or with the lessee. The language reads that the Government, in consideration of the performance, shall agree to pay to the lessee, and then enumerates the different items involved in the construction of many different plants.

Mr. BUTLER. You will notice, Senator, that the construction is grouped in the same wording down to Dam No. 3. Those things enumerated above are what are in the present Government project, for which there are plans and specifications. We agree to go on and do these things, because they are provided for now. They are things the Government, I take it, will do itself if the property is not leased. There being no complete plans and specifications for Dam No. 3, we change the wording when we get there and state "when required by the Government." We take it for granted the Government wants everything above that done now. That is the purpose of all these hearings. The other things we are to do when required by the Government.

Senator KENDRICK. That statement places the limitation.

Mr. BUTLER. With this lease approved, as worded, the only things authorized to be done under it are the things enumerated in that paragraph above Dam No. 3. The other things mentioned are subject to future authorization. They are the future developments. There will, of course, be three or four more dams and storage reservoirs built on that river and there will be at least one nitrate plant by each dam. We agree to do this work for the very moderate construction fee of 5 per cent on the lowest possible cost to be fixed by the lowest public bid. We feel we will be very lucky to come out whole on a 5 per cent fee. We have to furnish all the engineering ability and the supervision and take all the responsibility. Ordinarily an engineer competent to handle this work would charge that much or more. That is a very small fee for an engineer, and it is a very small figure, and really it is a question whether we would come out whole with that 5 per cent. And we feel also that we can do this work for the Government at less cost, including that fee, than the Government can do it—we will have in charge of this work the very best and the highest priced experts who can be found—we will pay these men much higher salaries than the Government would pay them.

The bill, Mr. Chairman, which you have pending before the committee limits the salaries for the commissioners to \$7,500. That is as much as a Senator gets, it is true, but we would not employ a man for that whom we would put in a responsible position to get these results. We might lose a million dollars employing a man for \$7,500, where a \$25,000 or \$30,000 man would save us a million dollars.

The CHAIRMAN. These \$7,500 men provided in the bill have permanent positions. Don't you think that a man getting a position which, if he does his work right, would last as long as he lived, that \$7,500 a year would attract the very highest class of men?

Mr. BUTLER. You may be able to get some high-class man without any special qualifications for any special thing for that, but you could not employ a chemical engineer, best qualified for that work, for any such sum. We will expect to pay from \$20,000 to \$30,000 for high-class experts, and it will be economy for us to do it.

The CHAIRMAN. Senator, the man that you would put in charge of it would not necessarily be a chemical engineer, because he would have under his charge, or this board would, speaking of the \$7,500 men, three of them, trained men, capable of doing the work. There might none of them be engineers. I do not think it necessarily follows that they should be, but rather men who had great executive ability.

Mr. BUTLER. They would have to employ such experts.

The CHAIRMAN. Certainly they would. When they had a chemical problem they would have a chemist do it, and they would understand that. The men that operate and have charge of some of the greatest manufacturing establishments in the world are not engineers, and they are not experts in any certain particular line; but they have great executive ability. They have men under them that do it. They don't do it themselves.

Mr. BUTLER. You would have to take the limit off the men they employ. There is too much involved here to—

The CHAIRMAN. The limit on the men employed, under that bill, is \$12,000. I don't think you would have to do it.

Mr. BUTLER. Not a single one of the experts whom we will employ under this lease can be employed for that figure.

The CHAIRMAN. Take the man—he is not here, and we can speak of him without embarrassment—Colonel Barden, who has charge of the construction of this dam. I think everybody that came in contact with him was impressed with his wonderful comprehension of the work that he is doing. He is an expert. He is getting the salary of a colonel. He might resign from the Army and go out and probably be one of the \$25,000 men.

Mr. BUTLER. Yes, he might resign and get into that class at once.

The CHAIRMAN. He would at once, but he does not do it. He prefers to stay in the employ of the Government on the salary that he is getting, and he will probably stay there as long as he lives.

I happened to know—and I knew it because, I suppose, I was chairman of the Committee on Agriculture and came in contact with it—some of the best chemists the Government had, and I used to be interested in their work and used to talk to them about it. They used to come to my house in the evening, during the war, and we used to talk over their problems. I happened to know one of the

best chemists that we had, and became very intimately acquainted with him, getting a salary, I think, of less than \$3,000 a year. He was offered, while he was getting that, \$10,000 by the Standard Oil Co., and refused it, and he continued to refuse it until the war was over. I don't know whether, since, he went with the Standard Oil Co., but he went with some private corporation finally when the war was over, and started in at a salary of \$10,000 a year. He gave up a salary of probably \$2,500 or \$3,000. I happen to know, from talking with him, that this man would have stayed in the employ of the Government if he had been able to get a salary of \$5,000. He would have stayed there for life; but his salary, living in Washington, with a family of growing children, and several girls in the family, he was not able to live on that salary that he was getting, and he wanted to save up something for his family, naturally, and he left.

I don't think the Government would have to pay the best men those fabulous prices. Personally, I don't believe there is a man living that is worth \$50,000 a year anywhere, in any line, I don't care who he is.

Mr. BUTLER. He is if he produces you results that will save you millions of dollars.

The CHAIRMAN. Certainly, but you can get a man cheaper than that that will produce the same results. You know and we all know, those of us, at least, who are lawyers here, that the great lawyers of the country who are getting \$50,000 or \$60,000, their work is done, probably, by a clerk that is only getting \$2,500 a year. About all the lawyer does is to sign his name.

Mr. BUTLER. But there is a wise head over him that O. K.'s it.

The CHAIRMAN. He signs his name on the dotted line, and that is about all he does. He has a reputation—

Mr. BUTLER. His name never goes on that dotted line until he knows and approves what the man under him has done.

The CHAIRMAN. Yes.

Mr. BUTLER. It is his name and his reputation that stands there to guarantee that the opinion is sound.

Senator, I have been surprised to find the number of high-class men in all branches of the Government service staying on at low salaries that could command larger ones outside.

The CHAIRMAN. Well, they would rather work for the Government.

Mr. BUTLER. Well, it is a sense of loyalty, in a way.

The CHAIRMAN. Yes, it is.

Mr. BUTLER. A man who has graduated at West Point or Annapolis feels that the Government has given him his education and that he does not want to be a slacker and jump out when he can get more money somewhere else, and it is only when the time comes that he feels that he has to do it, with a large family, and he knows there is somebody else in that department that will take his shoes, that anyone resigns, as a rule.

Senator HEFLIN. It is, to a large extent, the certainty of continuous employment. He knows as long as he does his work properly he will continue to have that employment, whereas if he would go with the company that gets Muscle Shoals he would know that in a few years his job would be over.

Mr. BUTLER. There is a great deal in that. A man gets in the habit of living economically and doing without things until he ceases to feel the want of them. Habit is one of the most tremendous factors in the world, and loyalty is another. But when the Government does lose them they get larger salaries and they keep climbing up, and often become the highest priced men in the world.

The CHAIRMAN. Let us bring it down to yourself. You are not a chemist and you are not an engineer.

Mr. BUTLER. If you had tried to make farming pay as long as I have, you would be something of a chemist and engineer both. I have tried to become a chemist to solve the problem of plant food.

The CHAIRMAN. If my bill becomes a law and you were offered one of these places at \$7,500 a year, don't you feel you would be perfectly competent to handle it?

Mr. BUTLER. I say to you frankly, Senator, that the only thing that would make me take it, if I did—

The CHAIRMAN. I am not saying whether you would take it, but would you not recognize the fact, and would we not all recognize the fact, that as far as competency is concerned, notwithstanding you are neither a chemist nor an engineer, you would be able to fill the bill, because you know, in a practical way,

more than a chemist does and more than an engineer does, the great problem that is to be solved.

Mr. BUTLER. Well, I feel this way, Senator, that I could do my duty there and select the special men for each place.

The CHAIRMAN. Exactly.

Mr. BUTLER. But you want a higher leeway for employing such specialists than your bill gives.

The CHAIRMAN. That might be.

Mr. BUTLER. That is just the point. We must get the best specialists in the world to handle this Muscle Shoals project to make a success of it, and we will have to pay them as large or larger salaries than anyone else in the world will pay for them. It would be false economy and folly to do otherwise.

The CHAIRMAN. Senator, we were speaking of the bill that provides for salaries of \$7,500 for the three men that would be charged with this, and I was calling attention to yourself.

Mr. BUTLER. Yes.

The CHAIRMAN. Would you not accept that position for \$7,500 just as quick as though it was made \$25,000? You might not want it at all under any consideration.

Mr. BUTLER. If I were a rich man, Senator, I would gladly accept such a position, regardless of the salary, on account of my great interest in the most important work to be done there—the chance to render such a great public service. No man could desire to leave a greater monument than to do what can be done with Muscle Shoals for the prosperity of agriculture and the welfare of the whole country.

The CHAIRMAN. I would not expect to get as good work out of a man who took it purely for the money that was in it as a man who would take it because he was interested in a great problem such as this that we are trying to solve.

Mr. BUTLER. That is true; if the man was independent of his salary.

The CHAIRMAN. There is not any man, unless he happened to be very unfortunate or in some out-of-the-way circumstances, but what, in a position of this kind, if left where he is not tied up by any diplomatic proposition and is not compelled to shine in society and show off at dinners, balls, and so on—there is not a man but what with a salary of \$7,500 can keep the wolf from the door and get along pretty well and educate his children and save a little money.

Mr. BUTLER. Of course, any man can do that if he has to do it. Lots of times that is so. Then look at this phase of it: But the same man, no matter how conscientious and patriotic he may be, will produce better results—we are so built—if he has an attractive profit coming as a result of his efforts than if he is being paid a modest salary. This is why the men in charge of the development of this great project should have an opportunity to reap a profit in proportion to the success they produce in making cheap nitrates. The greatest results will be produced if there is behind it the spur and incentive of profits commensurate with the success. This is the way to get the best out of a man.

The CHAIRMAN. Oh, yes; I think the man ought to have a profit. I think \$7,500 will give a man a profit who will live right, and you will get a man who will make a success. On the other hand, if you give him so much you are apt to drive him crazy, make a society fiend of him instead of an actual worker in the line where you want him to do something.

Mr. BUTLER. The chance to have just reward measured by the success you produce is a wonderful stimulus to initiative and creative effort. There is really no limit to human capacity. The thing that is a surprise and a thrill to all of us is when we are put up against it, that we develop qualities that we did not know we had. The man who gets along through life doing just what we would call his duty each day never does fully develop; it is only when you have that incentive—

The CHAIRMAN. I agree with you, Senator, entirely. That is illustrated in every great effort. It was illustrated in the war, for instance. It is the same with a country as it is with a man. Incentive is the mother of invention. But you can not make a man better or have him invent more or do better or accomplish more by giving him a whole lot of money so he can live extravagantly and squander it.

Mr. BUTLER. Of course, you can not make a silk purse out of a sow's ear; and nothing is to be gained by paying a man a salary bigger than he is worth. That is a waste of money and a detriment to man. When you have a big under-

taking which requires ability, skill, foresight, and initiative, then you will get the best out of a man if there is the stimulus of reward commensurate with the size of the success. That has been the experience of the world, and in a thing like this, where you have a new art, just in its infancy, with unlimited possibilities—

The CHAIRMAN. Somebody made improvements in the Haber process during this construction down there during the war. Wasn't it made entirely by employees of the Government?

Mr. BUTLER. Yes; but under the incentive of war, and I venture to say, with the greatest respect toward our experts who have made these improvements under that incentive, that if this proposition to continue nitrate development is dropped there will not be another step of progress made until the next war, when we will be caught again in a condition of unpreparedness.

The CHAIRMAN. I do not believe there will be; but on the other hand, suppose we go ahead and develop it and put these same men in charge—these Government employees—who are not getting salaries as much as a Senator gets, can we not expect as much development from them as you would get from anybody?

Mr. BUTLER. I would expect more from them if they had the stimulus of profit to take the place of the stimulus of war. The mainsprings of human action are fixed by nature, and we must touch them if we are going to call forth the limit of human capacity.

The CHAIRMAN. Do you think we could construct this dam cheaper if we would discharge Colonel Barden from the job and then employ him at double the salary?

Mr. BUTLER. The finishing of that dam is hardly a fair illustration. That work has already been planned and the finishing of it a matter of routine. But when it comes to working out the great engineering problem of developing the whole water supply of that river to its fullest we will do it more effectively than the Government can do it, even if the great engineer whom we have employed was back on the public pay roll and was in charge. Our whole organization will have a great incentive which will be absent from a Government undertaking. This will be true to even a greater extent in the development of the art of the fixation of atmospheric nitrogen. The chance for large profits will be the greatest possible incentive for the strictest economy in operation and fullest initiative to reduce the cost in making nitrates. But to come back to Dam No. 2, I feel sure that we can finish it cheaper than the Government can.

The CHAIRMAN. You may be able to do it.

Mr. BUTLER. I am sure we can. But that is a question we are not going to argue. We have put the alternative proposition in our offer, for the Government to finish it, or for us to; either will suit us. What we do want to do is to begin to operate that plant and carry out the main purpose in view as declared in the national defense act. Who builds Dam No. 2 is a bugatelle. It is an incident. We have offered to do it at the least figure we can do it, and we think we will save you money. It is immaterial to us whether we do it or the Government does it; but if you are going to give us the lease we want you to do it at the earliest date possible, so that we can go to work redesigning these nitrate plants, and be ready to operate them by the time the dam is finished. We want that done by our own experts who will operate these nitrate plants and conduct our research plant. If you delay action until after the low-water period this summer, you will lose a whole year in starting up this great project. In the mean time this large investment will be lying idle, the valuable property will be deteriorating, and that great water power will be running to waste, while our starved soils will be crying still louder for that most vital of plant foods. The cry for bread will be answered with a stone.

(At 12.30 o'clock p. m. the hearing was adjourned to 10.30 o'clock a. m., Monday, April 24, 1922.)

MUSCLE SHOALS.

MONDAY, APRIL 24, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The Committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris (chairman) presiding.
Present: Senators Norris, McNary, Gooding, Norbeck, Harrison, and Heflin.
The CHAIRMAN. The committee will come to order.

STATEMENT OF HON. MARION BUTLER—Resumed.

Mr. BUTLER. We closed on Saturday with paragraph 20. Paragraph 20 provides for the engineers making joint reports to the lessee, and the Secretary of War.

Paragraph 21 provides for use of the stores and supplies on hand.

Paragraph 22 is complementary to paragraph 6.

We will now look again at that paragraph, so as to consider them together.

All responsible people, who are informed—who know what they are talking about—agree that nitrates can not be produced by the fixation of atmospheric nitrogen to-day at a cost low enough to enable farmers to use them for fertilizers. The cost is too high, compared to the selling price of the staple farm products. The process for taking the nitrogen from the air must be improved and cheapened. But everybody believes that this can be done and that it will soon be done. Now shall we proceed to develop this art and improve the process, or shall we sit down and wait for other countries to do it? Will we never learn anything except when forced by bitter experience? It is an old and true saying that it is a fool who will learn only from that costly school.

Well, we have had one sharp experience; are we so foolish that we must wait for another? We were caught in the last war where we could not get from this country or from any other country a sufficient supply of nitrogen for explosives alone. We were forced, without sufficient knowledge or experience, to try to get nitrogen from the air, regardless of cost. When the war was over, in spite of this costly and dangerous experience, we stopped; and we have done this foolish thing in the face of the fact that we have not a sufficient supply of nitrogen for the needs of peace times, to say nothing of preparedness for the next war.

The consensus of opinion of all authorities, the world over, is that there is no available known source of supply that is adequate except from the air. The scarcity of nitrogen in this country is more acute than in any other civilized country. We are not taking one pound from the air. Our total supply last year, including the imports from Chile and all the by-products from coke ovens and other minor sources of supply, was only 175,000 tons, while our soil needs many times that amount. Therefore we must either go ahead or develop the art to take it from the air so as to get a sufficient supply and at a reasonable price in times of peace for commercial purposes or sit and wait for somebody else to do it and then be at their mercy both as to price and supply. That would obviously be improvident to the point of being, if I may say it, both foolish and unpatriotic. So we have not only the experience of the war emergency, but we have also a continuing emergency before us to-day if we care anything for the prosperity of agriculture, which was starved for want of nitrogen even before the war and terribly starved during the war. We have a large investment already made at Muscle Shoals to do this very thing, but we are

told that we can not to-day make nitrates there without a subsidy. That is true, but instead of asking Congress to vote a straight subsidy to make nitrates and to develop this art we have worked out a plan in this Engstrom proposal to have this great water power to finance the whole project. We will make the whole project finance itself by the sale of a part of the power produced. We have now two nitrate plants there. It is obvious we should run both of them, because all of the testimony is, that, if we run both of them at full capacity, we would not produce as much nitrogen as our country needs to-day for agriculture alone. But it will take only about half of the power to run both plants at full capacity, so we will have considerable excess power for sale. There is a market in the surrounding country for all of the excess power we will have for sale, and besides when you develop cheap electric power in any section of the world, at once the market—the demand grows and grows rapidly. So these questions of a market for this power—and think of the great good that it will do in that fine section of the country which has been backward in development by the sale of this excess power for local use and development.

Mr. Chairman, if we had this art of taking nitrogen from the air perfected now so that we could to-day make nitrates cheap enough for them to be used liberally on the soil, then I should say that we ought to devote all of that power from the beginning to running more nitrate plants. But in the present state of the art common sense says that we should proceed to develop the art and learn how to cheapen the process, and that the way to do that is to run the two plants that we have there and also a research plant, so as to be producing and learning at the same time. Then as soon as we can sufficiently cheapen the process we should build Dam No. 3 and another nitrate plant by it by the improved process; and then proceed to develop that whole river with more dams and storage reservoirs and more new nitrate plants. By the time we can get that whole million horsepower developed and devoted, all of it, to the manufacture of cheap nitrates, agriculture will be calling for every pound of it and more. The present rate of increased demand for nitrogen for fertilizers alone is $7\frac{1}{2}$ per cent a year. That means that in nine and one-half years the supply needed will be doubled, even if the rate of demand does increase. But when we have cheapened the cost of nitrogen, then its use will at once be greatly increased. Farmers will buy twice as much when they can make a profit by using it.

Now, in order that this great investment at Muscle Shoals may be put to work producing the much-needed nitrates and selling them at from \$5 to \$10 less per ton we have worked out a plan in paragraph 6 for financing such production and operation, without calling upon Congress for direct subsidy. We have provided for creating a fund to finance the making of nitrates at a loss until we learn to make them at a profit. We create the large part of that fund by the sale of excess power, and while we are doing it we will be serving that country around by selling the people light and power that they need. It would be wrong, unless a great public and overshadowing national necessity called for it, to rob any section of the use of a part of the hydroelectric power developed there. Nothing but a national necessity would justify it, but if there is any one thing that would justify the use of all the hydroelectric power at any one place for one single purpose, it is to make cheap nitrates.

But, fortunately, we can serve all that surrounding country with light and power by the sale of excess current and make a profit on it large enough to run both these plants at full capacity without any subsidy from the Government. We can do that by saving what is to-day going to waste. That enormous water power is running to waste every minute. Your great investment, \$106,000,000 there, is not only standing idle, producing nothing and losing interest, but it is deteriorating every hour. Those plants would be better if run than standing still. The \$17,000,000 you have spent on Dam No. 2 will soon be a loss if that dam is not finished. Besides, that dam as it stand there to-day is a block to what navigation the people along that river had before. If we are not going to finish that dam, then we ought to put dynamite under it and blow it up just as quick as possible, and clear the river of this costly obstruction to navigation.

Now, we create that fund for the financing of the making of nitrates (during the time they must be made at a loss) by turning into it 66 $\frac{2}{3}$ per cent of the proceeds from the sale of all the excess power; 75 per cent of the proceeds arising from the sale of by-products; and all of the proceeds from the sale of nitrates and fertilizer compound until we make them at a profit; and the

typewritten amendment at the bottom of paragraph 6 provides that when that is not sufficient to run these plants at full time the lessee will contribute one-fifth of all his part of the proceeds from the sale of excess power also to that fund. Let us see how that will work out. We can not, of course, give you exact figures as to the sum that will be derived from each of these sources, but our proposed contract does state with exactness just what is to be done, and we do know that the fund will be large enough to do what is proposed. We can have a reasonable estimate on the intelligent and clear-cut testimony of Colonel Barden as to what it would cost to produce say 180,000 kilowatts and make it all primary power during the whole year by supplementing the water-power through the three months of low water period with steam power.

He estimated that it would cost \$600,000 to run the two steam plants during the part of the year necessary to add to the primary power made by water to make 180,000 kilowatts of primary power. That is for coal and the operation of the steam plant. It would cost, for the whole year, only about \$300,000 to run the hydroelectric plant. There we have a cost of \$900,000, not counting labor that would be used in the nitrate plants. Now, let us see what we could do to meet that cost; to run those plants to the full limit both day and night. Admitting it will take 80,000 kilowatts (and probably it will take only 75,000 kilowatts) to run the two nitrate plants, we would then have at least 100,000 kilowatts of power to sell. Now, if we sold that much at, say, $1\frac{1}{2}$ mills per kilowatt, then two-thirds of the proceeds would make \$876,000 for this fund from the sale of power alone.

Remember that this is at the minimum price and for the minimum period of 12 hours per day, but we will always sell some power for more than 12 hours a day and for a higher price than $1\frac{1}{2}$ mills. But we would have at the minimum \$876,000 from the sale of that power to go into this fund. Then, taking the maximum cost of \$900,000 to run the steam plant and the hydroelectric plant, we will be short only \$34,000. Right here we come in with this typewritten amendment to paragraph 6, where the lessee agrees to contribute one-fifth of his part of the proceeds from the sale of power; one-fifth of one-third is \$87,600. Add that to the \$876,000 and we have \$963,000; so we have a clean margin of \$63,000 right from the start. Now, with the steam power and the hydroelectric power all paid for out of this fund, what can we make nitrates for?

Senator GOODING. How much of a margin? Let me have that again.

Mr. BUTLER. Eight hundred and seventy-six thousand dollars from the sale of power; 20 per cent contributed from the lessee, \$87,600; making a total of \$963,000, which pays the \$900,000 expenses for the power plants and leaves a margin in the fund of \$63,000 not needed. Then the cost of the nitrates will be determined largely by the cost of labor in the nitrate plants.

Senator GOODING. Is there any question about a market for the power?

Mr. BUTLER. None whatever. You heard the Alabama Power Co. appeal to you to let them have this excess power. They told you they needed at least 100,000 kilowatts more power now. They said they would have to go somewhere else to develop that much power if they could not get this, because they had a market for it now. There is no place where they can develop that power as cheap as we can sell it to them. The estimate which I have given you was based on a minimum price of $1\frac{1}{2}$ mills, and we will sell it, probably, higher than that. The Alabama Power Co. is selling all of its power much higher than that. Their lowest is 5 mills, and from that up. We figured to sell it by wholesale. We do not intend to enter into the retail business. We intended to offer this power to the several power companies near enough and let them retail it through their distributing systems.

Senator GOODING. Is it necessary to build transmission lines?

Mr. BUTLER. We have provided that this transmission line shall go with this lease.

Senator GOODING. That will deliver it direct to the Alabama Power Co.

Mr. BUTLER. If they give us the best price for it, we will sell it to them, but if they do not we will take up that transmission line and connect it up with somebody else. Anybody who wanted it worse than the Alabama Power Co. would unquestionably move that transmission line for us or will build a transmission line to Muscle Shoals to get this cheap power. It will be the cheapest power in that country.

The CHAIRMAN. You say, Senator, this 20 per cent in this typewritten amendment that you have added there would bring in \$87,000?

- Mr. BUTLER. Yes; \$87,600, to be exact, on the estimate submitted.
- The CHAIRMAN. That is 20 per cent of your income?
- Mr. BUTLER. Yes; as estimated.
- The CHAIRMAN. Then the gross amount of your income—
- Mr. BUTLER (interposing). Will be one-third of the proceeds from the sale of power. Under the estimate it would be—
- The CHAIRMAN (interposing). About \$435,000?
- Mr. BUTLER. \$438,000, even.
- The CHAIRMAN. Income?
- Mr. BUTLER. Gross income.
- The CHAIRMAN. You would get that from—
- Mr. BUTLER (interposing). From our part of the sale of excess power. We would sell that power for \$1,300,000, according to this estimate.
- The CHAIRMAN. You figure that you would get something over a million dollars?
- Mr. BUTLER. \$1,314,000, to be exact, is the least possible estimate from the sale of that much power.
- The CHAIRMAN. What power you would not need to run these plants?
- Mr. BUTLER. About what is needed to run both plants at their full capacity, day and night. We could sell that much power and have that much cash. That is the minimum.
- The CHAIRMAN. Under your proposition you get \$438,000 of that?
- Mr. BUTLER. Exactly.
- The CHAIRMAN. The Government gets the balance?
- Mr. BUTLER. Yes; \$876,000.
- The CHAIRMAN. The Government?
- Mr. BUTLER. Yes. And under this amendment we would contribute \$87,000 out of our part to this fund.
- The CHAIRMAN. If you did not get enough from these other funds provided for under section 6, you would be bound under your contract to contribute 20 per cent—
- Mr. BUTLER (interposing). All the time.
- The CHAIRMAN (continuing). Of your part until the other means of income might be sufficient?
- Mr. BUTLER. Just as long as it is necessary to produce we have maximum results.
- We have still a further provision in paragraph 15. Until that fund is so created from the sale of power we have provided to advance all the money necessary for the operation of the plant. So there is not a chance under this proposal for this plant to ever stand idle for a minute for want of sufficient funds.
- Now let us come back to the cost of making the nitrates.
- We have taken off all the cost of the steam plants and the hydroelectric plant by the sale of excess power; so there is not anything left but the labor used in the nitrate plants and their upkeep. With all this cost taken off, we will be able to make these nitrates for \$35 a ton or less, in my opinion. Therefore we can undersell Chilean nitrates the very first day. This subsidy from the sale of power will do it, beyond question. Then it is just a question for the Secretary of Agriculture to say whether we will sell these nitrates for \$35 or \$40 a ton. If we sell at \$40 we will be making \$5 a ton, say, as profit; we will get, of that, \$1.25 a ton for our profit and will turn \$3.75 a ton into this fund.
- But when we improve the Haber process so that we can make nitrates for the selling price, and the proceeds of the sale of excess power is not needed to subsidize the making of the same, then all of this fund will go into the Treasury of the United States as cash rental on the lease.
- In paragraph 22, subsection (a), we have also provided that when Dam No. 3 is built and nitrate plant No. 3 is put up by it, we will then ask for only 25 per cent from the sale of excess power, and we will contribute to this fund 75 per cent of the proceeds. We can do this because our overhead charges will not be increased in proportion to the increase of power produced, and therefore we can afford to handle the larger proposition for smaller percentage of the sale of excess power. The typewritten amendment at the end of subsection (a) provides for the 20 per cent to be contributed by lessee under conditions named in section 6. The remainder of the revenue to lessee will come only when he has made a complete success. It will come from 25 per cent of the profits on nitrates and fertilizers, if we ever sell them at a profit.

But in another section it is provided that we shall never receive any profits on nitrates, even if they are sold at a profit, until the amount paid into the Treasury of the United States from the sale of excess power shall be the full amount collected, without any of it being contributed to finance the manufacture of nitrates. When that time comes, then if the nitrates are sold above cost we shall share 25 per cent of the profit. We expect to reach that time, and we should, of course, share in the profits for having accomplished such a result. Lessee's other source of income is from 25 per cent of the sale of by-products.

Section 23 provides for furnishing free to the Government all the power necessary to operate the lifts or locks.

Paragraph 24 is the emergency provision. We surrender this property to the United States (Government under any emergency, or agree to devote it all to making explosives for the Government, if the Government desires us to do so.

Paragraph 25 is as follows:

"The lessee agrees to protect the Government for the full and faithful performance of the contract by giving a good and sufficient surety bond, to be approved by the Government."

We put no limitation on that bond.

Par. 26. Inspection: It provides that the Government shall have access to our books and everything we do. Besides, we will have two directors from the Government in our company, sitting on the board of directors all the time.

Par. 27. Repairs: We felt that we had to provide, if a leak was found in dam No. 2 after we begin to operate, the Government should itself repair that without taxing the fund for making nitrates. This is a possible danger in that limestone country.

The CHAIRMAN. What investigation have you made, if any, along that line? I was curious when I read this, why you put it in your proposal. Are you suspicious that there is something wrong there with the foundation of this dam?

Mr. BUTLER. I think the Government engineers have some doubt about it. It is not an anticipated, but a possible, danger.

Senator HEFLIN. That is the first time I ever heard anything along that line.

Mr. BUTLER. Well, Senator, I don't think that there is any real cause for worry. But we know in a limestone country that the question of building a power dam must take this possible danger into consideration. After you get the pressure on to its full head you may have water come from below, through some subterranean crevice. That is a peculiarity of a limestone country; and if you start with a little crevice, it will soon grow big by the pressure from the water, and it is necessary to correct it at once.

Senator GOODING. Is this limestone broken to some extent?

Mr. BUTLER. Yes; subterranean holes through it.

Senator GOODING. We have just such a condition in the lava country.

Mr. BUTLER. It is probably more serious in a lava formation. Here at Muscle Shoals we have poured cement into every hole above the dam where we thought there might be the beginning of an outlet. If we have succeeded in forcing that cement into every crevice, then it is safe—"bull high and hog tight," as we say in the South. Our engineers think they have done that. They have used every precaution and they think it is all right, but everybody knows that you can never be sure until you put the pressure on it.

Senator HEFLIN. If they should discover one, they could stop that by pouring cement?

Mr. BUTLER. Yes.

Senator HARRISON. It really is not a very serious proposition?

Mr. BUTLER. No; if you take it in time, and it is not too big.

Senator GOODING. It has to be found.

Mr. BUTLER. The only trouble is in finding it.

Senator GOODING. We have been through all that in the West.

Mr. BUTLER. The water may pass under the dam before you can detect it. Our engineers have gone down below and have tried to find if there is any sign anywhere of the water rising, but, of course, it would be worse when the pressure goes on if there is any such leak.

Senator HEFLIN. How deep is this foundation there?

Mr. BUTLER. They have bored down, if I remember the testimony—how many feet, General Haan?

Gen. W. G. HAAN. They told me when I was down there that they had driven some tunnels into the banks where the dam is to be to a depth of something like 700 feet, and that apparently since they got into the virgin rock away from

the surface these crevices rapidly disappeared, and they really, so far as I can ascertains, apprehend very little danger from any such source.

The CHAIRMAN. You are speaking of that work off on the side. That was not under the foundation of the dam. We saw that when we were there.

Senator GOODING. There is that element of risk. I have in mind exactly such a condition as that out in my country in building a reservoir, building an earth and rock dam. The same thing happened, but they succeeded in finding it and checking it by pouring cement.

Mr. BUTLER. Our engineers think that they have plugged every possible hole. They have used all possible precautions.

Senator GOODING. When you say "our engineers" do you mean the Government engineers?

Mr. BUTLER. The Government engineers.

Senator GOODING. I think a provision of that kind is proper.

Mr. BUTLER. Anybody who knows about the formations in a lava country and a limestone country knows that that possibility is there.

Senator GOODING. There is the possibility there that should be provided for.

Mr. BUTLER. It has been provided for as far as foresight can do it, but there is still the possibility, and this is why we put in this paragraph:

"PAR. 28. Proposal divisible."

As already explained, if the Government prefers to go ahead with Dam No. 2, then we will accept the lease subject to that condition. But we want you to make this lease with us at once, even if the Government finishes Dam No. 2, so that we can go to work redesigning the nitrate plants and have them ready to run as soon as the dam is completed; obviously this should be done.

Now, Senators, here is a proposal which is plain; it is workable. It is just, and it will be a success, one that through 50 years will be conducive to success by forcing the lessee, under all conditions, to put forward his fullest ability and capacity to serve the public and the Government's interests or his own interests will suffer. It is designed to carry forward the declared purpose of the national defense act. As one American citizen, I feel that to the extent of my capacity I ought to urge Congress to go forward with that great purpose without further delay. The delay since the war has been inexcusable, with the needs for more nitrogen growing each day.

Suppose war should break out again to-morrow. We could not get nitrogen for explosives alone except from the air, and we are not prepared. We can not get enough even now in time of peace for the soil alone. Should war come, we will need a double amount, because modern warfare calls for all resources. In the last war our great cry was to make biscuits, because they were just as important as bullets to win the war; yet we called upon our farmers to make "bricks without straws." We tried to do it, and we exhausted our soil until to-day we can not make it produce half what it should produce from the labor and effort that we put on it. This is a most serious situation. It affects every consumer as well as every producer. It also jeopardizes the national safety.

If we care nothing for the success of agriculture, then we should remember the dangerous position we were caught in without nitrogen when we were rushed into the World War. We then rushed blindly trying to get nitrogen from the air. Will we refuse to think except when a gun is pointed into our faces? The way to win the next war is to be prepared with plenty for both agriculture and for war when it comes. With that \$106,000,000 investment standing there idle and with the greatest water power in the United States still unharnessed and running to waste, what shall we do? Will we take the back track and scrap it and throw it away? Will we let that investment be sold at scrap prices, to be taken by somebody to be used for private profit? That is most improvident. It is inconceivable, with the needs before us, that we would do such a thing. Yes, there it is; and since the war we have not raised a hand to finish that work. The investment is there, it is deteriorating every hour, the water power going to waste, and our starved soils crying for nitrogen.

Senator McNARY. Do you propose to use this in the public service, for the public good, or for private gain?

Mr. BUTLER. We propose to carry out the purposes of the national defense act and to do it on a business basis. Obviously, the way to get the best results from such an enterprise is to make the profits of the lessee dependent upon the success of that enterprise, and that is the way we have drawn up this proposal. We have purposely tied ourselves up so that we can not prosper unless we make a success of this whole enterprise. But if we develop this art and produce

great results we will prosper accordingly. I believe with that kind of an incentive behind us we will produce greater results than the Government can produce without such incentive. Human nature is so constructed that we can get out of our own selves greater results if we have such a spur and incentive.

There is, in fact, no known limit to human capacity; we never know what we can do until we are put to the test; it is indeed a misfortune to any man to be forced to go through life without ever being put in position where he must meet obstacles or have the greatest incentive to arouse and call forth all of his unknown latent powers. Those who have been put to such tests and who have met them, have had an electric thrill when they found that they could do what they had never thought possible. That is the key to individual development and to human progress. If we will put such a spirit behind the problems of seizing from the air an ample supply of cheap nitrogen the thing will be done in the quickest and most efficient manner.

Senators, it is inconceivable that you will do nothing; either have the Government do it or let us do it. If this proposal is not sound in any respect, if it is not fair in any respect, if there is any weak spot in it, then give us a chance to change it.

A sufficient supply of cheap nitrogen is of such vital importance to revive our staggering agriculture that I, for one, am willing to take this contract with the profits cut to the bone to start with, provided there is left in it a chance to be properly rewarded if we produce the result desired. Now, I have every confidence that it can be done.

Senator GOODING. Put up your money and take the chance that it can be done?

Mr. BUTLER. We will put up our own money until we create a fund, under paragraph 6, to finance the production of nitrates. But the construction should be paid for by the Government, because the Government should hold the title to this property.

Senator HEFLIN. And put up its own money?

Mr. BUTLER. Certainly; because it is Government property. We are not buying anything from the Government. We are offering to lease it to carry out the purposes of the national defense act, and at the end of 50 years we agree to return this property to you in perfect working condition, when it will be many times more valuable than when we take charge of it. This property will be of immense value at the end of 50 years, and then the Government gets it back and the benefit of all the development. We do not even put in this proposition that we shall have a preference at the end of 50 years, because if we have not satisfied the American people and the Government at the end of 50 years that we have done our duty, and done it satisfactorily, we don't want any preference, and we would not deserve it if we did want it.

What agriculture wants done with Muscle Shoals is exactly what is provided to be done under this lease. Every resolution passed by every farm organization and every women's organization directed to reducing the high cost of living and promoting the public welfare have all called for cheaper nitrates, cheaper production, cheaper food and clothing. The Engstrom proposal is the only one before you that proposes to devote this whole proposition to doing that very thing.

Senator McNARY. Do you think that this proposal would affect the cost of living by reducing it?

Mr. BUTLER. Unquestionably; whenever you reduce the cost of production you reduce the cost of living. Cheaper nitrogen means cheaper food and clothing.

Senator McNARY. Oh, well, but that plant will not produce enough fertilizer, as everyone knows, to put in a wheelbarrow, as far as that capacity is concerned, in comparison with that which is used, but how is the development of that plant, producing that small amount of fertilizer, which is perhaps one-tenth or one-twentieth of the consumption of the whole country, going to affect the cost of living and cost of agricultural products?

Mr. BUTLER. We can produce at Muscle Shoals with the two nitrate plants there 230,000 tons of nitrates, which will make 2,500,000 tons of fertilizers. This is half of the total amount of fertilizers used in this country last year, and that quantity will certainly stabilize the price.

Senator McNARY. I have heard that before, but I have no confidence in it at all. I am expressing a frank opinion.

Senator GOODING. I don't think you heard Mr. Butler's proposition as to how much power is to be used down there.

Senator McNARY. I know how much power there is there, unless you increase the minimum capacity by the process of storage.

Mr. BUTLER. We look forward to that if we are given this contract.

Senator McNARY. Do you propose to make a complete fertilizer, or simply sulphate of ammonium?

Mr. BUTLER. We propose to offer both to the public under regulations to be approved by the Secretary of Agriculture, because our Agricultural Department is trying to teach the farmers to mix their own fertilizers. It is cheaper for them to do it, and they can then use the fertilizers more intelligently.

Senator McNARY. You mean mix it without the filler and use it in concentrated form?

Mr. BUTLER. We should offer for sale, with the approval of the Secretary of Agriculture, the nitrates alone, or the complete fertilizer. But it will be cheaper for the farmer to buy his ingredients and mix them himself.

Senator McNARY. Eighty-five per cent, of course, is filler. We all know that. There are three elements that go to make up fertilizer. How many farmers, without a knowledge of chemistry, and very careful application of formulae can take it in its concentrated form and use it without great injury to his crops? There is not one in a thousand.

Senator HEFLIN. They would have instruction from the Agricultural Department.

Mr. BUTLER. Yes, and county agents; but my negro tenants know how to do that. They know that 100 pounds of 16 per cent potash contains only 16 pounds of potash. The same with 16 per cent nitrate of soda and 16 per cent phosphoric acid. So they know that if they take 250 pounds of potash and 250 pounds of nitrate of soda and 1,000 pounds of phosphoric acid and then add 500 pounds of sand that they have a ton of what is called 8-2-2 down South or 2-8-2 up North. They know that a unit in fertilizer is 20 pounds and that two units are 40 pounds, and that it takes 250 pounds of bulk of 16 per cent potash to contain 40 pounds. The same with the 16 per cent nitrogen. And the 8 means that there is four times as much phosphoric acid.

Senator McNARY. We use a different one up in our country. We have higher nitrogen.

Mr. BUTLER. Then you have 9-3-3 or 10-4-4. The unit of any one of these ingredients is 20 pounds; but each one of the three plant foods—nitrogen, potash, and phosphoric acid—are each contained in a holder which is from five to eight times the weight of the plant food, making 1,500 pounds, and then 500 pounds of sand is added to make the 2,000. The sand is the filler and is different from the holder.

Senator McNARY. I understand that thoroughly. It is clearly demonstrated in the House hearings; but that does not cover my point at all. I have simply tried to develop this thought, and you will find it in the testimony before the House committee, by all the scientists, that there is not one farmer in a thousand can use a concentrated fertilizer without the filler. They have not the machinery for it. I have seen it applied on fruit trees in the West thousands of times without success; but that does not particularly develop my point. I want to know how much fertilizer you are going to make at this plant in completed form under your horsepower?

Mr. BUTLER. We will produce, with these two plants, around 240,000 tons of sulphate of ammonia annually.

Senator McNARY. Reduce that, now, to nitrates.

Mr. BUTLER. That will make 2,500,000 tons of fertilizer, but we will offer the nitrates to the farmer and urge him to do his own mixing. Our farm agents are instructed to tell a farmer, if he buys concentrated goods, how much sand to mix with it. We have farm administrations to-day of such capacity that they visit the farm and ask the farmer: "What are you going to put in this soil, cotton or corn or tobacco? Then you need this mixture of fertilizer for that crop on that field." They analyze the soil for him and they tell him what mixture to use for that field and that crop.

Senator HEFLIN. I have known a great number of farmers who do mix it.

Mr. BUTLER. The number is rapidly increasing each year. Where a farmer once learns to mix his fertilizer, he never again buys any of the ready-mixed stuff.

Senator HEFLIN. Have you had any bad effects from the mixing?

Mr. BUTLER. Not a single case on my plantation or elsewhere within my personal knowledge.

Senator McNARY. I don't want to insist on an answer to the question, but you are getting off again.

Mr. BUTLER. We make 240,000 tons. That will produce about 2,500,000 tons of fertilizer at 8-2-2. That is about half what we used last year. Now, there you are.

Senator McNARY. That is one element of the fertilizer. Is that ammonium sulphate or ammonium nitrate?

Mr. BUTLER. Ammonium nitrate is the explosive. There is some fertilizer value, but that is more expensive, mind you, than the ammonium sulphate, and that is for explosives. That is what we made during the war. But ammonium sulphate is the soluble form of nitrogen that is desirable for fertilizer.

Senator McNARY. I understand. That is 240,000 tons, or one-half of the ammonium sulphate. That is one ingredient?

Mr. BUTLER. Yes, sir.

Senator McNARY. And it is two parts and the potash is two parts, and the phosphoric acid eight?

Mr. BUTLER. Yes.

Senator McNARY. So you have 2 out of 12, which comes a long way from being fertilizer.

Mr. BUTLER. It is one-sixth of the total weight, but it is the scarcest and most expensive element of all.

Senator McNARY. I beg to differ on that. We have a source of supply of nitrates, but we have only one place, or two, where there is any potash developed in this country.

Mr. BUTLER. We are not producing any nitrogen in this country except the by-products from coke ovens and other minor sources.

Senator McNARY. And what we import from Chile.

Mr. BUTLER. Last year we used in this country only 175,000 tons, and half of that came from the coke ovens and the other half from Chile; that is all we used, on account of its scarcity and high price, when we needed to have used four times that. Germany got, last year, from our coke ovens about 100,000 tons and made 400,000 tons from the air to get her 500,000.

Senator McNARY. I believe in it, Senator. We are both alike on that. But it is not fair to say that we will produce that much fertilizer. It is an important ingredient of fertilizer, I know, but it is only one portion of the fertilizer, and it is misleading to make the statement.

Mr. BUTLER. Nitrogen is the only ingredient for which there is no adequate source in this country, or in the world.

Senator McNARY. That is a fair statement, but the other is not.

Mr. BUTLER. And there is not any known source for an adequate supply except from the air.

Senator McNARY. I think we all have the same opinion.

Mr. BUTLER. The world is better supplied with potash. The Province of Alsace and Lorraine has very valuable potash deposits. There are enormous deposits in Germany, and we are developing some in this country. Besides there is some potash in all soils.

Senator McNARY. There is a little in southern California and a little in Idaho, and there is some in Colorado, but we do not know that there is enough. We have tried an experiment. The Government had a plant out there, but it did not prove a success.

Mr. BUTLER. We are getting some very good potash from this country. But let us suppose we had to import every bit of potash into this country—is that any reason why we shall refuse to develop the fixation of nitrogen from the air? It is the only safe source of supply.

Senator McNARY. I tell you again, Senator, I quite agree with you, but it is the method of getting it that I am interested in.

Mr. BUTLER. We must get it from the air and we must find a cheaper method or process for doing it. That is what we must do at Muscle Shoals. We must keep doing the thing until we learn how to do it cheaper. We should run both plants and also run a research plant. We should devote this whole project to the one great purpose of making cheaper nitrates and then more nitrates. So our proposition looks to developing this whole river within 10 or 15 years, and devoting the whole thing to making nitrates. And before that can be done we will have need for all the nitrogen which can possibly be produced by the use of all the 1,000,000 horsepower of that river.

Nitrogen is the one vital plant food which we must have and which we must get in this way, because there is no other way to get it.

Senator GOODING. It is your proposition to turn this plant to its fullest capacity for that purpose?

Mr. BUTLER. Yes; and then we can not produce enough until we build more dams and more nitrate plants.

My idea is to sell these cheap nitrates, Senators, to the public and to the fertilizer companies just as cheap as to the farmer. I don't believe in attempting to destroy the value of all the fertilizer companies in this country; if they will mix fertilizer at a reasonable profit, then they ought to be allowed to do it. If we can make and sell these nitrates to everybody, including the fertilizer companies, at the same price and \$10 a ton below present prices, then it would hurt nobody, but it would simply mean cheaper fertilizer, whether we or the fertilizer companies made the complete fertilizer. The fertilizer companies can make as much profit mixing cheap nitrates as they can mixing costly nitrates. Cheaper nitrates mean cheaper fertilizers, and cheaper fertilizers mean larger yields to the farmer at less cost, and cheaper food to the consumer. The one way to accomplish these things is to develop Muscle Shoals and devote the whole project to the production of cheap nitrates.

Senator HEFLIN. Senator, farm organizations all about in the South and West have passed resolutions in favor of developing the Muscle Shoals project and having fertilizer made there.

Mr. BUTLER. Yes; and they want the whole project devoted to that one purpose.

Senator HEFLIN. The Fertilizer Trust of the United States has sent a lot of literature to Members of the House and Senate protesting against—

Mr. BUTLER. I have read it all.

Senator HEFLIN. That would indicate that the farmer knows that he is going to get fertilizer cheaper if this thing is put through, and the Fertilizer Trust knows that its day of monopoly on this thing is gone if it is developed at Muscle Shoals.

Mr. BUTLER. The fertilizer companies are acting very foolishly. With cheaper nitrates they can sell fertilizers cheaper and make still the same profit; and if fertilizers are cheaper the farmers will buy much more of it. The only people who have a real reason to oppose the development of Muscle Shoals are the coke-oven people, who want a high price for their by-products, and the nitrate kings of Chile.

Senator HEFLIN. The question is whether we will do that which is best for the largest number of people or permit a few people to hold up the whole mass of people who use fertilizers.

Mr. BUTLER. That is the whole proposition in a nutshell.

Senator GOODING. Then it is your purpose to use the first power for fertilizer?

Mr. BUTLER. We have provided that we should use secondary power for running these plants as far as it can be done without limiting the output, because we can sell the primary power at a higher price, and it is necessary to raise in this way the money needed to finance the making and selling of nitrates at a figure below cost, until we can learn how to make them cheaper. But under the estimate which I gave you, based on Colonel Barden's estimate of cost to produce 180,000 kilowatts of primary power, we can use 80,000 kilowatts of that power to run these plants and have 100,000 kilowatts to sell. This will finance the plant and enable us to sell these nitrates at \$35 a ton or less at the beginning—with cheaper nitrates our farmers will use at least 10,000,000 tons of fertilizers next year. The saving of \$10 a ton will mean a saving to the farmers of \$100,000,000 next year. In nine and one-half years we will be using over 20,000,000 tons; then there will be a saving of \$200,000,000 a year. Before the end of this lease our farmers will be using 100,000,000 tons; that will mean a saving of \$1,000,000,000 a year. These are enormous figures, but they are the inside of what can be done, because as soon as we develop a cheaper process for taking the nitrogen from the air we will be able to save much more than \$10 on every ton of fertilizer. Indeed we will make this investment at Muscle Shoals pay for itself almost the first year in the amount saved on the fertilizer bill of the country. We will make it pay for itself many, many, and many times over during the life of this lease.

There can be no question about the wisdom of going ahead with this project and devoting the whole thing to the production of cheap nitrates. It would be a monstrous thing to abandon this project or to scrap it or to sell it to a private monopoly. It will be almost as bad to lease it to one who will use only one-tenth of this power for making nitrates, while using the other nine-tenths

for private profit. That would be robbing the farmers of a sufficient supply of much needed nitrates and at the same time subsidizing one person to compete with all other American citizens in private manufacturing. Such use of public money will be indefensible from every standpoint. We must not make such a mistake, and we must not longer starve our soils by delay. Neither should we deny the people around Muscle Shoals a chance to buy some of this cheap current for light and power. Every man down there is or should be for the Engstrom proposal, except the men who expect within the next few months to reap a fortune in a real estate boom. Those men will unload and get their profits and then disappear. The people who buy this land will be left there with no chance to buy cheap light and power; the farmers will not get their fertilizers, and the people around will not get their light and power if we turn this project over to a private monopoly, because the power will be used for private manufacturing. They will see that great water-power development at their very doors and will not be able to buy one kilowatt of it. That thing should not happen there, as it has happened at Niagara Falls. The Engstrom proposal is the only one which will sell part of the power and light to these people and then take profit and use it to finance the production of cheap nitrates. We propose to utilize to the fullest this whole investment to serve a great public need. Then give us this lease and let us begin, or in heaven's name have the Government do it. This is by far the most important thing before Congress, and it calls for action; not next year, but now.

Senator GOODING. A public calamity unless it is met in some way or other.

Mr. BUTLER. This is the only proposal before you which provides for devoting that whole water power and that whole investment to the making of cheap nitrates. We will produce the maximum supply at the lowest cost. Therefore I appeal to you to give us this lease and do it now or proceed to have the Government at once perform this great public service, for which there is a nation-wide need.

Mr. Chairman, I want to thank you and your committee for your courteous attention.

The CHAIRMAN. You said Saturday, Senator, that Mr. Engstrom wanted to be heard a few minutes.

Mr. BUTLER. Yes; he is present.

ADDITIONAL STATEMENT OF MR. FREDERICK E. ENGSTROM.

Mr. ENGSTROM. Mr. Chairman, Senator Butler has expressed our views and explained our offer in every detail, and I simply desire to repeat that the spirit in which this offer is made is that I hope that suggestions can be made whereby we can amend this offer in any way possible to make a contract that will be capable of being lived up to and operate for the period which this lease calls for. If the committee has any questions to ask me regarding this offer or on any subject that I can answer, I will be glad and will endeavor to answer them, and if there are any suggestions whereby this offer can be amended I would greatly appreciate such suggestions, and if in the future the committee desires any further light on the offer or any figures to be worked out I will be glad to supply them.

I have engaged Gen. George W. Goethals to act as my engineer and as director of this company in case this contract is awarded me for the company.

The CHAIRMAN. Will General Goethals be interested in it in a financial way?

Mr. ENGSTROM. Yes.

The CHAIRMAN. He will have charge of the construction work, will he?

Mr. ENGSTROM. Yes, sir.

The CHAIRMAN. Will he be one of the officers of the corporation which you propose to organize?

Mr. ENGSTROM. Yes, sir.

The CHAIRMAN. Senator Butler said that the proposition was to organize a corporation with \$2,500,000 capital, or about that.

Mr. ENGSTROM. Yes.

The CHAIRMAN. Do you expect that to be paid in, all of it, at once?

Mr. ENGSTROM. We would want to go into that matter. Whatever Congress would want, or whatever the committee thinks necessary to put in, we will arrange to have put in, not on a public stock-selling proposition, but a syndicate of our own friends and our own interests.

Senator GOODING. There is no question about it, but that you can raise the necessary money?

Mr. BUTLER. In paragraph 15 we provide to advance the money right from the jump.

The CHAIRMAN. Are there any other questions by members of the committee?

Mr. BUTLER. May I, at this point, leave with the committee a diagram which we have prepared and which I intended to use while discussing paragraph 6 and Colonel Barden's testimony, to show to the committee by a curve drawn on the diagram of just how the water power at Muscle Shoals must be supplemented by steam power.

If the members of the committee will notice, this curve illustrates it. Up to this point that is primary power that will be produced from the hydro-electric dam for the year around without any coal. Where this curve begins is where we must begin to supplement the water power with steam power, and it shows just how much steam power must be added each week to make up the falling supply of water as we approach the dry weather period. This diagram illustrates Colonel Barden's testimony. We will leave a copy for each member of the committee.

(At 11.50 o'clock a. m. the hearing was adjourned to 10.30 o'clock a. m. to-morrow, Tuesday, April 25, 1922.)

MUSCLE SHOALS.

MONDAY, MAY 1, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in Room 224 Senate Office Building, Senator George W. Norris (chairman) presiding.

Present: Senators Norris, McNary, Capper, Keyes, Gooding, Norbeck, Harreld, Kendrick, Harrison, and Heflin.

The CHAIRMAN. The committee will come to order. Mr. Mayo, we are ready to hear you.

**STATEMENT OF MR. WILLIAM B. MAYO, CHIEF ENGINEER OF THE
FORD MOTOR CO., DETROIT, MICH.**

Mr. MAYO. I don't know just how you wish to conduct this hearing. Do you expect me to make a statement?

The CHAIRMAN. We are going to let you handle it. We have given everybody a free rein, and now we are ready to take up Mr. Ford's proposition. I wish you would first give your name, occupation, and business for the record.

Mr. MAYO. W. B. Mayo, chief engineer, Ford Motor Co.

The CHAIRMAN. Where do you live, Mr. Mayo?

Mr. MAYO. Detroit, Mich.

The CHAIRMAN. Your description of your business, I think, sufficiently describes who you are. Proceed now in your own way in regard to the offer that Mr. Ford has made for the purchase or the leasing of Muscle Shoals.

Mr. MAYO. I brought over with me, I think, enough copies of Mr. Ford's offer for each member of the committee, showing all of the clarifications as it stands to-day; we clarified the language of the offer somewhat while going through the hearings before the House Committee. I don't know that I have any statement to make in regard to it other than here it is and I am open for questions.

The CHAIRMAN. Well, if you want to take it that way, I will ask you, Mr. Mayo, to state to the committee in your own way what in your judgment the offer of Mr. Ford in plain English means. I think it would be well for you to take it up section by section and explain it to the committee.

Mr. MAYO. It means, in general, that Mr. Ford proposes to take over all the nitrate plant property of the United States located at Muscle Shoals, together with their steam power plants in fee, and to take a lease of the water power portion of the project, which includes two dams known as No. 2 and No. 3.

Taking the offer up paragraph by paragraph, the first thing which appears of any real importance which has been talked over at quite some length, with the House Committee and was in regards to the size of the company that Mr. Ford proposed to form; what amount of capital it might have, which amount you will see we have inserted. It is to be a company with paid-up capital stock of not less than \$10,000,000.

Then in paragraph 2 it refers to dam No. 2, with its locks, power house and equipment, all to be built in accordance with the present plans that have been made by the United States engineers.

The CHAIRMAN. Have you any information to give the committee as to who will compose this company—who will own the stock in it? Who besides Mr. Ford will be interested in it in a financial way?

Mr. MAYO. I don't think anybody at present but Mr. Ford and his immediate family.

The CHAIRMAN. Practically, Mr. Ford will put up all the capital, then?

Mr. MAYO. Yes, sir. Paragraph 3 further relates to Dam No. 2 and states the lease price that he pays, which is all fully explained. Paragraph No. 4 sets out the maintenance fee that is paid annually.

Senator McNARY. Mr. Chairman, may I make this observation? The document before us contains a letter from Henry Ford dated July 8, 1921. That has numbered paragraphs in it, then there is a proposal, I imagine a supplemental proposal, in the back, and that has numbered paragraphs in it also. I was wondering if the witness was speaking of the first proposal or the modified one?

Mr. MAYO. The modified one. Everything, as it now stands, is in accordance with this last one, which is entitled "Copy."

The CHAIRMAN. I should think, Mr. Mayo, it would be very appropriate at the beginning of your testimony to have this amended proposition of Mr. Ford printed in the record at this point. You can do as you please about it, but the record ought to show, I should think, just what your proposition is. So far it does not appear.

Mr. MAYO. I thought it did.

The CHAIRMAN. We have no information, for instance, as to these modifications of your proposition now before us.

Mr. MAYO. I see. Well, then, I suggest that we put this modified proposal in the record.

(The proposal was further modified in the course of Mr. Mayo's statement, and, as further modified, will be found at the conclusion of his statement.)

Mr. MAYO. Paragraph No. 5 refers simply to the power we are to furnish to the Government for the locks, which is furnished free; that is, the locks in connection with Dam No. 2. Paragraph 6 refers to starting the work on Dam No. 3 as soon as the construction equipment is released from Dam No. 2 and sets out the amount of horsepower which is to be installed, and further sets out the fact that the Government shall purchase all flowage rights and rights of way which are to be acquired through an agent of the company. Paragraph No. 7 relates to the building of Dam No. 3, and its locks, power house, and equipment.

Senator GOODING. Are you reading from the copy now?

Mr. MAYO. Yes, sir.

It also sets out the amount of lease price for Dam No. 3.

Paragraph 8 refers to Dam No. 3 and the amount is set out for the maintenance of that dam.

Paragraph 9 refers to the amount of power furnished from Dam No. 3 for its locks, which is also furnished to the Government free.

Paragraph 10 refers to the sinking fund that is set up to wipe out the entire capital cost within the hundred years' lease period.

Paragraph No. 11 refers to all the nitrate plant property, including nitrate plant No. 2 and nitrate plant No. 1 and contiguous property. It also includes the Waco Quarry property, also the property of the Warrior River plant at Gorgas. You will notice some changes in this paragraph. We have so changed it that it only includes everything now owned by the Government.

The CHAIRMAN. In other words, your modification means, as I understand it, that the Government assigns to you whatever rights it may have there, and you step in the Government's shoes?

Mr. MAYO. Exactly.

The CHAIRMAN. As you had it at first, you required the Government to give you a good title to the whole thing?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Not only what the Government owns, but what the Alabama Power Co. owns?

Mr. MAYO. No, sir; only what the Government owns.

The CHAIRMAN. In your modified form, suppose you would get into litigation with the Alabama Power Co., as you probably would, you would contend, I suppose, that as a matter of law the contract that the Government has with the Alabama Power Co., giving the Alabama Power Co. the right to purchase the Government's interest in the property is null and void?

Mr. MAYO. Yes, sir.

The CHAIRMAN. That is your contention?

Mr. MAYO. Yes, sir; based on the opinion of the Judge Advocate.

The CHAIRMAN. Suppose you should be defeated in that in court, and the court should hold that that was a valid contract, and that the Alabama Power Co. was entitled to have it carried out according to its terms, what would happen then?

Mr. MAYO. Well, if that is the only alternative we would have to sell it to them, I presume, according to the contract.

The CHAIRMAN. Then, if it was sold to them according to the contract, Mr. Ford would get the money for the Government's interest instead of the Government getting it.

Mr. MAYO. Yes, sir.

The CHAIRMAN. If the contract failed and the Alabama Power Co. bought it, the money or the value of it, as it would be determined by the court, would be paid to Mr. Ford?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Well, have you any idea as to its value? Could you give the committee your judgment as to what the value of the Government's interest in the Gorgas plant is?

Mr. MAYO. I don't think that I can. I have not made a close inspection of it.

The CHAIRMAN. Have you looked it over any?

Mr. MAYO. Only once; yes, sir.

The CHAIRMAN. Do you know what the Government put into it?

Mr. MAYO. I think it was approximately \$5,000,000.

The CHAIRMAN. It would not be worth \$5,000,000, would it?

Mr. MAYO. No, sir.

The CHAIRMAN. I suppose it could be duplicated now for less than the Government paid.

Mr. MAYO. My guess would be that you could buy it now probably for three-fourths of what it originally cost, at least.

The CHAIRMAN. Does your estimate include the transmission line from Gorgas?

Mr. MAYO. Anything they may have which is now owned by the Government. I am just estimating that they probably paid 25 or 30 per cent more during the war-time period than they would have to pay to-day.

The CHAIRMAN. Now, this modified form you have here provides that at the end of a hundred years this company or corporation organized by Mr. Ford shall have the preferred right to re-lease it or buy it?

Mr. MAYO. Re-lease the power.

The CHAIRMAN. Re-lease the power?

Mr. MAYO. Yes, sir.

The CHAIRMAN. In other words, at the expiration of the lease period, if the Government leases it again to anybody the Ford Co. shall have preference?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Do you think that provision would be binding, as a matter of law, on the Government?

Mr. MAYO. Well, I think that is in accordance with practically all the decisions in the water-power act. Am I right in that, Mr. Waldo?

Mr. WALDO. Yes.

Mr. MAYO. Practically the same.

The CHAIRMAN. Would you not gather from that, then, if the court would uphold that contract, the court would likewise uphold the Alabama Power Co.'s contract with the Government, which provides that when the war is over and the Government does not need it any more, then shall sell the Government's interest to the Alabama Power Co.?

Mr. MAYO. Well, we have written in here "as prescribed by Congress," so we take whatever Congress may prescribe at that time.

The CHAIRMAN. Yes; at the end of a hundred years.

Mr. MAYO. Yes.

The CHAIRMAN. Yes; but you would not think, would you, that Congress, under that kind of a contract, would have a right to completely nullify it by passing an act saying that Mr. Ford's company should not be considered at all, and it could be sold to somebody else at the end of a hundred years.

Mr. MAYO. I should think that they would have to consider us, but they have the right to do whatever they please.

The CHAIRMAN. Then, that does not mean anything to Mr. Ford or his company, does it, if Congress can say notwithstanding that kind of contract it is going to disregard it?

Mr. MAYO. Well, I think they can.

The CHAIRMAN. Laying aside the legal proposition, and suppose that Congress at the end of a hundred years, or at any time between this time and a hundred years from now, should say, "We have made this contract with Mr. Ford, but we are going to violate it, and we now pass a law which says that this company shall not be considered at all in a re-leasing of the property"—would that be anything that the Congress morally would have a right to do, even though they could do it legally?

Mr. MAYO. No; I think they should follow the letter of the contract.

The CHAIRMAN. Then, why would not the same reasoning apply to the Alabama Power Co. in this contract? Even though technically we could avoid it, why should we not make good on the contract?

Mr. MAYO. I don't know but that you would have made it good in passing it over to Mr. Ford just as it is. He is acting in the capacity of your agent—

The CHAIRMAN. That may be. I am not disputing that. Mr. Mayo, at all; but the Government has made a contract with the Alabama Power Co. that at the end of the war the Government would give its interest or sell its interest to the Alabama Power Co., and the contract provides how the amount shall be agreed upon. If we turn this over to Mr. Ford, we violate that contract. You say that as a matter of law it is no good, anyway. Now, the question is, How about it morally? Ought the Government to take advantage of a technicality, even though it could?

Mr. MAYO. Well, I don't know that I have enough of a legal mind to argue the technicalities of their contract.

The CHAIRMAN. It is not a legal question at all. There is no technicality of law involved in it. Let me ask you another question. Why does Mr. Ford want the Gorgas plant? You must see, it must be perfectly apparent to you, that you are getting Congress at least into a very difficult place if they undertake to turn Gorgas over to you. Why does he want it? It is not connected or necessary, as I can see, to the development of Muscle Shoals or anything connected with it.

Mr. MAYO. Well, it is the cheapest source of steam power to supplement the primary power.

The CHAIRMAN. Well, it would be the cheapest power, probably, because it is right at the coal mine—

Mr. MAYO (interposing). Yes, sir.

The CHAIRMAN (continuing). Until you developed power from the dams. You would have cheaper power than Gorgas, even, would you not?

Mr. MAYO. After the dams are finished it is the cheapest source of supplementary power.

The CHAIRMAN. Would not Mr. Ford expect to operate the steam plants at nitrate plant No. 2, or either one of them?

Mr. MAYO. Yes, sir. The one at Gorgas is about half the size of the one at No. 2, and when the flow is diminished to an extent where it became necessary to use steam he would start Gorgas up first?

The CHAIRMAN. You would start up Gorgas first?

Mr. MAYO. Yes, sir; until your requirements called for the starting up of No. 2 plant.

The CHAIRMAN. There is a steam plant at nitrate plant No. 1?

Mr. MAYO. Yes, sir; but it is so small it hardly counts. You would operate Gorgas until your demand passed its requirements, and then start up the steam plant at No. 2.

Senator KENDRICK. Mr. Chairman, I wanted to ask the witness if it is not, in his opinion, almost certain to be true that the Alabama Power Co., situated as they are, with joint interest with the Government in the construction of this plant, would pay the Government a very much better and greater proportion of the cost of the plant than they could afford to do, even though the Ford company took over the Muscle Shoals. Is it not your opinion that the other people could afford to pay the Government a larger proportion of the cost than your company could?

Mr. MAYO. I don't know. We have made a certain offer. What they pay is entirely dependent on the contract, I presume.

Senator KENDRICK. Well, the geographical location of it would suggest that fact to be true.

Mr. MAYO. I don't think it would be worth any more to them than it would to us, if that would answer your question.

The CHAIRMAN. Now, would you expect to get their part of the plant—their interest in the plant?

Mr. MAYO. Oh, no; only the Government's interest.

The CHAIRMAN. I know, but when you came to operate it, now, you could not practically operate with the Alabama Power Co. and the Government scrambled together as it is now.

Mr. MAYO. We think so.

The CHAIRMAN. Have you an understanding with the Alabama Power Co.?

Mr. MAYO. No, sir.

The CHAIRMAN. You would have to have that?

Mr. MAYO. We would have the same understanding that the Government now has in its contract with them.

The CHAIRMAN. But you are going to violate this contract, or you want us to violate the contract that the Government has with the Alabama Power Co. If you are going to enforce that you would have to sell to them.

Mr. MAYO. We do not have to sell until a certain period has passed in any event and we can at least operate as long as the contract allows us to.

The CHAIRMAN. Well, according to their contract. Now, have you contemplated this, that when the Ford Co. got this Gorgas plant, if you would make a deal with the Alabama Power Co. by which you simply sell to them after you had completed the dam?

Mr. MAYO. I think the preferable way would be to make some arrangement with them to operate it for us.

The CHAIRMAN. If Congress accepted your proposition you would have authority, would you not, to sell to the Alabama Power Co., must, as the Government does not, or in any other way that you and the company might agree?

Mr. MAYO. We would have only the authority the contract gives us, but the plant is of more value to us, or surely of as much value after the dams are finished as it will be at the start, because it supplements our low-water period.

The CHAIRMAN. The difficulty is that the property is all intermingled, all built on the Alabama Power Co.'s land, even including the transmission line, which is on their land. Every building is on their land, and they own the coal mine. The houses constituting the homes for the men are all intermingled and some of the houses owned by the Government and the machinery inside owned by the company, or vice versa, all mixed up. If you owned the Government's interest, which you would if we accepted your proposition, you could not divide the output of it without the Alabama Power Co.'s consent. There is no such agreement between the Government and the Alabama Power Co. in the Government's contract.

Mr. MAYO. I understand.

The CHAIRMAN. If you made that kind of an arrangement it would be because you made a new contract with the Alabama Power Co., and if they refused to go into partnership with you, then you would have to buy them out or they would have to buy you out, wouldn't you?

Mr. MAYO. Yes, sir. We have no fear of that at all.

The CHAIRMAN. Would it not be profitable, from your proposition that you are taking up here? You get that, and you don't pay the Government for it, excepting that it constitutes part of the property that is transferred to you and you then sell it to the Alabama Power Co. They would be willing, to save I presume, litigation and trouble, to pay you a good deal of money for it—perhaps more than is provided in the contract they shall pay the Government, and there would be nothing to hinder you from doing that. I would like to know whether in any of your negotiations between yourselves that has ever been contemplated, and whether that is not liable to happen if Ford gets it.

Mr. MAYO. The reason we want it is for its power.

The CHAIRMAN. I know.

Mr. MAYO. We don't want it to sell.

The CHAIRMAN. Yes; I know that, but you have some difficulties when you get it, that either you have to sell, as I look at it, or they would have to sell.

Mr. MAYO. I don't think so, Senator. There is no reason why we could not make a satisfactory working arrangement.

The CHAIRMAN. Probably, but it looks queer to me, now, if you have made no preliminary arrangement with them about agreeing to such a division, and are buying it without having such agreement. It seems to me if I were buying into that kind of a mixed up, scrambled affair, before I would count very much

on it I would want to make arrangements with the other fellow to see whether we could not agree on a division of the power, and if we could not I would not buy it.

Mr. MAYO. I am sure Mr. Ford would act justly in the matter.

The CHAIRMAN. Yes; but the other company may be unjust.

Mr. MAYO. Then, they will take the consequences.

Senator HARRELD. Does not that contract provide for an arbitration—I mean the appointment of arbitrators to determine how much the power company shall pay the Government?

Mr. MAYO. Yes, sir.

Senator HARRELD. If it was assigned to you folks, you would be bound by that arbitration?

Mr. MAYO. Certainly.

The CHAIRMAN. He contends, Senator—he made this statement before you came in, that the contract is nul and void—that is, I understand Mr. Ford's contention is that that contract is nul and void and of no legal effect.

Senator HEFLIN. How much money was invested by the Alabama Power Co. in the Gorgas plant?

Mr. MAYO. I understand about \$5,000,000.

Senator HEFLIN. About the same as the Government?

Mr. MAYO. Oh, in their plant? No; I don't know, Senator.

Senator HEFLIN. You stated a while ago that the Government had invested \$5,000,000.

Mr. MAYO. Yes, sir.

Senator HEFLIN. I want to know how much the Alabama Power Co. put into the project.

Mr. MAYO. I have no idea.

The CHAIRMAN. There is one question involved here as a matter of safety to the Government. Mr. Mayo, don't you think that if the Government makes a lease to anybody of any of this property that it has down there, it ought to provide that the company or person would not have any right to sell it or dispose of it without the consent of the Government?

Mr. MAYO. I don't know that I am prepared to say. I think if we should fulfill our contract, or step into the Government shoes in regard to the contract, that should be sufficient.

The CHAIRMAN. Would you have any objection to further modifying your proposition here to provide that you have no authority to sell to the Alabama Power Co. or anybody else any of the property transferred to you, but you must utilize it for the purposes of the lease—without consent, of course, from the Government?

Mr. MAYO. I would not think so. I am, however, not prepared to take a definite stand on that.

The CHAIRMAN. Has Mr. Ford discussed with his engineers, like yourself, the terms of this lease? You are insisting on 100 years?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Everybody else proposes 50 years.

Mr. MAYO. Yes, sir.

The CHAIRMAN. And the law provides for 50 years?

Mr. MAYO. Yes.

The CHAIRMAN. Another thing I want to ask about it. Your proposition does not contemplate the manufacture of nitrates at nitrate plant No. 1?

Mr. MAYO. Well, we don't know. That may or may not be used—

The CHAIRMAN. As I looked through this modified proposal there was not any intention to manufacture nitrates at that plant.

Mr. MAYO. We do not agree to in the offer. We do not bind ourselves to do it.

The CHAIRMAN. You haven't any intention of making nitrates at plant No. 1, have you?

Mr. MAYO. Well, we may.

The CHAIRMAN. Is that true?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Well, would you not be will to obligate yourselves to make nitrates in No. 1?

Mr. MAYO. No, sir.

The CHAIRMAN. You would not be willing to do that?

Mr. MAYO. No, sir.

The CHAIRMAN. Are you a chemist, Mr. Mayo?

Mr. MAYO. No, sir.

The CHAIRMAN. Well, you know, in a general way, that nitrate plant No. 1, down there, was designed to get nitrates from the air by what is known as the Haber process?

Mr. MAYO. I am quite familiar with it; yes, sir.

The CHAIRMAN. And that nitrate plant No. 2, the one you propose to operate, it gets it from the air by the cyanamid process?

Mr. MAYO. Yes, sir.

The CHAIRMAN. And that the Government officials in building nitrate plant No. 1 were mistaken as to the machinery, and that that plant, as far as the machinery being able to get nitrates out of the air is concerned, has been a failure?

Mr. MAYO. Yes, sir.

The CHAIRMAN. And that it would take about a million and a half dollars to put it in shape so it would work?

Mr. MAYO. From that to three million.

The CHAIRMAN. From that to what?

Mr. MAYO. Three million.

The CHAIRMAN. From a million and a half to about three million, you think?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Whatever it would take, if it were equipped, it would be a cheaper process than that at nitrate plant No. 2, would it not?

Mr. MAYO. Well, that is doubtful.

The CHAIRMAN. Is it?

Mr. MAYO. The modified Haber process theoretically will make it cheaper, but the question is whether it is safe.

The CHAIRMAN. Of course, I am not a chemist either, Mr. Mayo, but I formed that opinion from what our experts tell us. I formed the opinion that they had agreed, practically, that the Haber process is the only one that offers the most promising aspect for the securing of nitrates. Do you get that idea from your study of the question?

Mr. MAYO. Theoretically it promises greater returns; yes, sir; but you are still, even with a modified apparatus, dealing with high pressures and high temperatures, both of which are more or less dangerous and deleterious to materials, and, further, it is a complicated process.

The CHAIRMAN. Do you agree with the scientific men when they say that the prospect of improvement is more apt to be with the Haber process than with the cyanamid process?

Mr. MAYO. There is nothing sure that we will confine ourselves to the cyanamid process.

The CHAIRMAN. No. I am not taking that up now.

Mr. MAYO. I see.

The CHAIRMAN. I would like to get your judgment on that.

Mr. MAYO. The possibilities are greater; yes, sir.

The CHAIRMAN. Then, I would like to know why Mr. Ford has obligated himself to extract nitrates from the air by the process that, from all we can find out now, from scientific men, is not as good a process as the one he will not operate or will not obligate himself to operate for nitrates?

Mr. MAYO. Maybe you are mistaken in what he offers. He does not obligate himself to operate nitrate plant No. 2 under the cyanamid process. He merely agrees to operate that plant at a certain capacity.

The CHAIRMAN. What process is he going to use there if he does not use the cyanamid process?

Mr. MAYO. He is not prepared to say, but he will have to equip it for whatever process he uses.

The CHAIRMAN. Do you mean to say he has some secret method that he is concealing that he is going to use?

Mr. MAYO. Yes, sir. Surely.

The CHAIRMAN. Well, I did not get that from the contract.

Mr. MAYO. If you will read the paragraph, you will see that he simply guarantees to operate that plant to a certain capacity.

The CHAIRMAN. I assumed from that that he was going to use the process for which the plant was designed.

Mr. MAYO. Not necessarily; no, sir.

The CHAIRMAN. In fact, I judge from what you say now he does not intend to use the cyanamid process?

Mr. MAYO. I don't think he will. He may start with it and later change to another process.

The CHAIRMAN. Will you give the committee an idea what the other process is, and what he proposes to do.

Mr. MAYO. I don't think I can, because it is in more or less of a partly perfected process, and there are a number of possibilities that we are working out. It is a little too early to state publicly what it is.

The CHAIRMAN. Can you give the committee this much information, that Mr. Ford, under that provision of the contract, does have in mind some other secret process that he expects to use instead of the cyanamid process?

Mr. MAYO. Yes, sir; and the process, we think, will be much safer and fully as cheap, if not cheaper, than the Haber process.

The CHAIRMAN. At the present time that is a secret?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Will the capacity of your plant be as great under the Ford process that he expects to use as it is now under the cyanamid process?

Mr. MAYO. I think he will operate at a greater capacity; but he guarantees to operate at that capacity, anyway.

The CHAIRMAN. You feel under the proposition that he is obligated to make, then, at least 110,000 tons of nitrate a year?

Mr. MAYO. Yes, sir.

The CHAIRMAN. At that plant?

Mr. MAYO. Yes, sir.

The CHAIRMAN. That is its capacity.

Mr. MAYO. Its nitrogen capacity is equal to 110,000 tons of ammonium nitrate, and he sets that up as the equivalent.

The CHAIRMAN. Will Mr. Ford's secret process require as much power as this does?

Mr. MAYO. I don't think as much; no, sir.

The CHAIRMAN. How much less?

Mr. MAYO. We are not sure yet. It is being worked out to dovetail in with other manufacturing processes that are to be used in our own business.

The CHAIRMAN. What does Mr. Ford expect to use nitrate plant No. 1 for?

Mr. MAYO. Well, he is not sure. We are feeling our way in working out our complete plan.

The CHAIRMAN. Can you give the committee any idea as to how much power, under this new or secret process that Mr. Ford has, will be required to make 110,000 tons a year?

Mr. MAYO. I could not say offhand. As I say, it dovetails into other manufacturing processes.

The CHAIRMAN. What do you mean by dovetailing in?

Mr. MAYO. I mean the by-product of the one is the product of the other.

The CHAIRMAN. Can you give the committee any information as to what the other products are, whether by-products or otherwise, that you expect to make in the process?

Mr. MAYO. They will be electric furnace steels and aluminums.

The CHAIRMAN. Aluminums?

Mr. MAYO. Yes.

The CHAIRMAN. Well, I have been wondering, Mr. Mayo, why it is that, representing Mr. Ford, you are not willing to take the committee and the Congress into your full confidence and let them know just exactly what you expect to do with this power if you get it. It might make a great deal of difference, I should think, in the consideration of the proposition by Congress. Have you any objection?

Mr. MAYO. No objection to that at all, other than we are working out a program that we do not want to give the full information on until it is fully worked out.

Senator McNARY. Mr. Mayo, may I make this remark at this place: I read in the hearings in the House, or some other document that I thought was official from the Ford standpoint, he intends to use nitrate plant No. 1 for manufacturing purposes, both in the creation of automobiles and spare parts that are being used in automobiles. Is not that part of the record?

Mr. MAYO. I think I made the statement that we would probably use nitrate plant No. 1 for manufacturing raw materials for automobile parts, but there is nothing very definite in that.

Senator McNARY. I thought the statement was made, anyhow, and I thought it was made by you also.

Mr. MAYO. Yes, sir.

Senator HARRELD. You do reserve the right to use this power for anything you want to use it for except the part from which you agree to make nitrates, otherwise you reserve the right to use the power for any kind of manufacturing purposes?

Mr. MAYO. Yes, sir.

Senator HEFLIN. Mr. Mayo, one of your reasons for not giving this secret process that you have in mind for making nitrate is, I suppose, that you have not yet submitted it for patent, and you are not yet ready to disclose to the public just what it is you have got?

Mr. MAYO. Not only that, but we have not formulated our definite plans, and we do not want to describe what you might call a tentative arrangement.

Senator McNARY. Mr. Mayo, is the Ford Co. doing research work through laboratories looking to the creation of a new process?

Mr. MAYO. Yes, sir.

Senator McNARY. The Government is doing it there under the direction of the Department of Agriculture?

Mr. MAYO. Yes, sir.

Senator McNARY. Are you familiar with the arc process?

Mr. MAYO. Yes, sir.

Senator McNARY. Are you considering that in connection with the work you are doing?

Mr. MAYO. We have considered it, but it takes so very much more power than the other processes it is hardly possible we will use it.

Senator McNARY. Then you have eliminated any further consideration of the arc process?

Mr. MAYO. I would not say fully eliminated it.

The CHAIRMAN. Does it take more power than the cyanamid process?

Mr. MAYO. Much more. It is the most expensive power user there is up to date.

The CHAIRMAN. So that to make it by the arc process, so far as it is known now by scientific men, one of the prerequisites would be the very large amount of cheap power?

Mr. MAYO. Yes, sir.

Senator McNARY. Don't you make nitrate of soda through the arc process, which you can not do through the cyanamid and Haber processes?

Mr. MAYO. No. It is a shorter cut method. You make nitric acid.

Senator McNARY. With the blending of oxygen and nitrogen you get nitrate of soda, which is the complete fertilizer?

Mr. MAYO. It takes very much more power. My understanding the product is nitric acid.

Senator McNARY. You have a complete fertilizer, though, in the product?

Mr. MAYO. It takes about five times as much power, and does not make a complete fertilizer as I understand it.

The CHAIRMAN. Paragraph 15 of the modified Ford proposal reads as follows:

"The company agrees to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other commercial fertilizers (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control."

Now, that is the only provision in your proposition, is it not, Mr. Mayo, by which this Ford Co. is bound to manufacture nitrates as fertilizers?

Mr. MAYO. I think so.

Senator HARRELD. Suppose you can not run it economically enough to compete with some other factories producing the same thing; would you continue to run it just the same under the terms of that contract?

Mr. MAYO. Well, we surely, with the low cost of power, could make it as cheap as anybody else.

Senator HARRELD. Suppose somebody else invented a process by which they could do it more cheaply than you could and patented that process and thus made it unprofitable for you to run to make nitrates, what would be your relief under the terms of this contract under that condition?

Mr. MAYO. I think, as I said to the House committee, that after Mr. Ford had exhausted every possible effort and proved beyond any question of doubt that he could not run in any other way but at a loss he could come to Congress and get some relief.

Senator HARRELD. The contract itself does not provide for that, does it?

Mr. MAYO. No, sir. As you will see by this offer, he agrees to run a research department, in which he expects to keep at least abreast of the times, and he further agrees to employ any improved method that can be found. That, together with the natural resources there, insures a minimum cost.

Senator HARRELD. He does agree, so far as the terms of the contract are concerned, unequivocally, to using the full power of plant No. 2 to make nitrates, does he not?

The CHAIRMAN. To its capacity.

Senator HARRELD. I say to its capacity.

The CHAIRMAN. Present annual capacity of its machinery and equipment.

Senator HARRELD. What about the capacity of the water power?

Mr. MAYO. He simply agrees to operate at a minimum capacity of, or the equivalent of, 110,000 tons of ammonium nitrate, which is its present plant capacity.

Senator HARRELD. I see. He can substitute the other power if he wants to?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Oh, yes. He can do it all by steam if he wants to.

Senator HARRELD. I see the point.

The CHAIRMAN. But if he used a higher priced power he would have to charge more for the fertilizer, would he not?

Mr. MAYO. Yes, sir.

The CHAIRMAN. As we construe your amended proposition now, would there be anything to prohibit him from using the cheaper power or selling it or making aluminum or automobiles or some other kind of products with it and then making fertilizer out of high-priced power, and, therefore, raising the price of fertilizer higher than he otherwise would if he made it out of cheap power?

Mr. MAYO. I would say he would be morally bound to use the cheapest power for the fertilizer.

The CHAIRMAN. What provision of the contract would require that? The point is, Mr. Mayo, he might make fertilizer out of high-priced power and add that cost of power to the price of the fertilizer itself and utilize the cheapest power for commercial enterprises for his own benefit.

Senator HARRELD. Is it likely that plant No. 2 would just be turned over to make nitrates for fertilizer and all the rest of the power used for commercial purposes? Is not that likely what would happen under the terms of the contract?

Mr. MAYO. I think not. If we are successful in what Mr. Ford plans to carry out, I am of the opinion that the fertilizer capacity will be two or three times what he has agreed to here.

Senator HARRELD. If that rule is adopted and followed, it would make fertilizer higher than it would be if he would use the water power, would it not, carrying out your point?

Mr. MAYO. Well, that question has never been brought up before and never entered our minds. The whole object was to use the cheapest power.

Senator HARRELD. Our object is to get cheap fertilizers to the farmers, if we can.

Mr. MAYO. Yes, sir; and that is Mr. Ford's object also.

The CHAIRMAN. We have just two objects in view. One is to get cheap fertilizers and the other is to be prepared to make explosives in time of war.

Mr. MAYO. Yes, sir. That plan is what he has tried to carry out—that idea—in this offer.

The CHAIRMAN. He agrees in this contract that he will not make more than 8 per cent on the fertilizer?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Now, if he could improve the process—and all scientific men think that it is going to be improved, although nobody, as you say, can tell just how—

Mr. MAYO (interposing). No, sir.

The CHAIRMAN. Although all the studies of our scientists seem to indicate that the Haber process is the one that offers the best field for improvement.

Mr. MAYO. Yes.

The CHAIRMAN. Mr. Ford's contract would provide that he could not make more than 8 per cent on the cost of fertilizer.

Mr. MAYO. Yes.

The CHAIRMAN. If he has the use of his power there to sell to somebody else or engage in commercial operations with, and had several grades of power, and

some of it went cheaper than others, he could utilize the cheapest power in his commercial operations and the most expensive power in his fertilizer operations, and the result would be, so as to make 8 per cent profit on the fertilizer operations, we would have as a result the fertilizer sold to the farmers for much more money than if it was made out of the cheapest power. Could not that happen under this proposal?

Mr. MAYO. It might possibly happen. As I say, that question has never been brought up before.

The CHAIRMAN. It may never occur, and I assume at the beginning you would have to use the cheapest power you have—perhaps the water power—to make fertilizer; but if you did improve it, as everybody hopes you will if you get it, and it was made much cheaper, so that you could make it out of more expensive power and still be able to sell it on the market, then in that case would it not be to your financial benefit, and would you not naturally expect that this company, trying to make all the money it could, which would be perfectly legitimate under this contract, would make fertilizer out of the higher-priced power and use the lowest-priced power for commercial operations, where they would get the money out of it?

Senator HARRELD. Thus defeating the purpose of making cheap fertilizers for the farmers?

The CHAIRMAN. Yes.

Mr. MAYO. Of course, we say in our offer that the farmers may be supplied with fertilizers at fair prices, without excessive cost, and so on; but laying all that aside, if there is any question in our wording here that we may possibly not use the lowest-priced power for the fertilizer product, we are willing to clarify it and make it perfectly clear.

The CHAIRMAN. I am glad to hear you say that.

Senator HARRELD. The point is, we want the public to benefit from his laboratory experiments.

Mr. MAYO. We have made every effort to so word this offer that the fertilizer end of the business and the stand-by condition of the plant for Government use in time of emergency are the two prime objects.

The CHAIRMAN. You would be willing to put a provision in there that in charging up the cost of the fertilizer you should count the cost of the power at not to exceed the cheapest power you have there? You could use any kind of power you wanted, I suppose.

Mr. MAYO. Of course, the secondary power, it goes without saying, is your cheapest power. There is a time when you have no secondary power and you are using nothing but primary power. If you are confined to using what you might strictly term as your cheapest power, you could only operate on your secondary.

The CHAIRMAN. That would mean if you operated exclusively on the secondary you could not operate all the time?

Mr. MAYO. Yes. It may not be good business to shut down during the period there was only primary power available.

The CHAIRMAN. On the other hand, it may be by coordinating these different power facilities there that very considerably, in your case—coordinate them all—you could perhaps most economically make fertilizer out of secondary power, because it would not be like a street railway or lighting system. There might be a season of 30 days in the year when you would want to shut down, let your employees have a vacation, and look over the machinery. Under the power developed by Dam No. 2, and later on by Dam No. 8, that would give you an opportunity to operate it by secondary power, which, as you say, is the cheapest there is.

Mr. MAYO. Well, Senator, we are glad you brought that point up, and we will clarify it so it will satisfy you, I am sure.

The CHAIRMAN. To my mind, it is quite an important proposition.

Mr. MAYO. I think so, too.

The CHAIRMAN. I am assuming, and we all are assuming—we may be all wrong, of course—that whoever gets this, or if the Government does it, we are going to improve this process. In fact, if I did not think it would be improved by the Yankee mind I would not take the interest in it that I am taking in it.

Mr. MAYO. There is no question about the improvement. There are several roads to follow. It is perhaps a little difficult to decide which road we will travel until our process is more definitely fixed.

The CHAIRMAN. Yes; and you may have to travel one road and stop and go up the other one.

Mr. MAYO. Exactly so.

Senator HEFLIN. But you do intend to manufacture fertilizers and to sell them cheaper to the farmer than he is buying them to-day?

Senator HARRELD. I don't think that is the question, whether he sells cheaper than they are buying to-day. The question is, the public is entitled to fertilizer at the cheapest possible price.

Mr. MAYO. The public is entitled to the fertilizer as cheaply as we can make it out of the best process that we can develop plus 8 per cent profit.

Senator HARRELD. That is it.

Senator HEFLIN. The trust fixes the price of fertilizer to-day, Mr. Mayo, and they absolutely rob the farmers at the prices that it charges. I understand it is the purpose of Mr. Ford to manufacture fertilizers cheaper, so that the farmer will be able to buy fertilizers cheaper than he can buy them now under the trust control. Is not that the purpose?

Mr. MAYO. Well, offhand, we think we could make fertilizer at about half the price it is sold for to-day.

The CHAIRMAN. Now, Mr. Mayo, I think one of the two objects Congress has in view is to do not only that, but to go further and to adopt whatever improvements may be made to still cheapen the product; in other words, at all times to make fertilizer as cheaply as it can be made by the use of the cheapest power we have down there.

Mr. MAYO. That is the sole purpose of this offer.

The CHAIRMAN. That is Mr. Ford's object; but we want to—and very properly, without casting any reflection whatever upon you or Mr. Ford either one—to see that is in the contract, because Mr. Ford is going to die long before this contract is carried out.

Mr. MAYO. Yes, sir.

The CHAIRMAN. And all people who are alive now will be dead before that time, and our posterity is going to handle the question; so it is just as important that we bind anybody that gets this up by contract that will go into every detail and protect the public in every possible way—just as much so as though we were dealing with somebody in whom we had no confidence at all. I think, because we know that the men we are dealing with now are not going to be the men that will carry out this contract.

How old is Mr. Ford?

Mr. MAYO. Fifty-eight.

The CHAIRMAN. He is about my age, and we will be shuffling off about when he does, and it is liable to happen any day. In fact, we ought to hurry this up, so as to get it through before we go. The great bulk of this contract is going to be carried out after he is dead and you are dead and I am dead.

Mr. MAYO. I think before he passes out he will probably make arrangements for an operating plan that this company will have to adhere to, which will please the public.

The CHAIRMAN. He can not do that unless it is in the contract with the Government. Those who succeed him can even change their articles of incorporation and have entirely different management of the corporation. It may be just the reverse.

Mr. MAYO. It all depends on how he leaves it. I guess.

The CHAIRMAN. The only way to protect the Government and Mr. Ford is to put it in the contract so that it can not be changed without the consent of the Government.

Mr. MAYO. The offer sets out here that he agrees to a minimum capacity, for one thing, and that he shall make fertilizer, for another, and further that the price is always under the control of the Agricultural Department of the Government and the farmers' organizations. So it is pretty well tied down, it seems to me.

The CHAIRMAN. Would Mr. Ford, or you representing Mr. Ford, consider any change in the proposition by which the time of this lease should be cut down from a hundred years?

Mr. MAYO. No, sir. We have talked over that to great length, and—

The CHAIRMAN. You would not consider a shortening of the period?

Mr. MAYO. No, sir. The project is so very large that Mr. Ford's investment would be much more than the Government's before he gets through.

The CHAIRMAN. As I understand his proposition, his investment could not be as much as the Government's.

Senator HARRELD. Oh, yes.

Mr. MAYO. By the time we have built sufficient manufacturing plants down there to absorb the power, my judgment is that Ford will have expended at least \$50,000,000.

The CHAIRMAN. Well, is that contemplated?

Mr. MAYO. Why, surely.

The CHAIRMAN. Then he does not intend to sell any of the power?

Mr. MAYO. No, sir. For a time, in all probability, when he will have to sell some.

The CHAIRMAN. He intends to use it for manufacturing enterprises?

Mr. MAYO. That is the main purpose; yes, sir. There will be a certain amount of power, probably, sold before he develops his plant sufficiently to absorb all the available power.

The CHAIRMAN. If there were manufacturing enterprises there all owned by Mr. Ford or his associates, up to the capacity of the power that would be developed in excess of what would be used to manufacture nitrates, it would, of course, be a mammoth undertaking.

Mr. MAYO. Exactly.

The CHAIRMAN. But in the meantime there is, I presume, a very large income coming in. You contemplate that, because you are going to have cheaper power than your competitors, in whatever business you go into, or very likely will, so your profit will be correspondingly large?

Mr. MAYO. Well, Mr. Ford is making automobiles, I think, cheaper than anybody else to-day; but he does not benefit by that. He sells the car at the lowest price.

The CHAIRMAN. I think he benefits by it, but he lets the rest of us poor fellows benefit by it also.

Mr. MAYO. He tries to.

The CHAIRMAN. He divides up, and that is the reason we like him.

Mr. MAYO. That is his plan.

The CHAIRMAN. But he is not doing it without any profit.

Mr. MAYO. Well, you can not operate successfully without profit.

The CHAIRMAN. He is making it all the time, and I am glad he is, and I don't want anybody to get this to make a financial failure of it. I want them to succeed. But it seems to me that while the fixing of the time is an arbitrary proposition, we have had it up so often in the Congress in the water power act—

Mr. MAYO. I know it.

The CHAIRMAN. —that 50 years is as long as the Government ought to lease anything of that kind, because of the awful uncertainty that we know is going to exist in 50 years from now, and that has been the policy of Congress.

Mr. MAYO. We are aware of that.

Senator HARBOLD. If this magnanimous policy of Mr. Ford is carried out for 50 years I should think the public would be the last people on earth that would want to take it away from him at the end of 50 years.

Mr. MAYO. Of course, this is not a water-power project strictly. It is a combination of water power and a large industrial project hooked together. So it is in a different class than the ordinary water power.

The CHAIRMAN. Then you would not consider the proposition of a 50-year lease with a provision in it, as we do under the general law, of a preference right to a re-lease for another 50 years in case the Government did not want to take it over?

Mr. MAYO. No, sir. Mr. Ford has stood fast on the hundred years from the start.

The CHAIRMAN. Now, there is another theory I would like to get your views on.

Mr. Ford's proposition would be to utilize this power in his commercial operations and manufacturing operations?

Mr. MAYO. Yes, sir.

The CHAIRMAN. He will not sell any of this power to municipalities over transmission lines, etc.?

Mr. MAYO. He would not want to see any power go to waste, so, for the period he was building up his plant and it would naturally go to waste, he would, of course, want to sell it.

The CHAIRMAN. While he was building up his enterprise he might do that?

Mr. MAYO. Yes, sir.

The CHAIRMAN. I mean as a permanent policy?

Mr. MAYO. That is not his intention.

The CHAIRMAN. There is another theory of utilization of water power in navigable streams that it ought to be spread over the public, given to the public and municipalities and States, etc., in preference to private corporations?

Mr. MAYO. Yes, sir.

The CHAIRMAN. The acceptance of Mr. Ford's proposition would prohibit the use of any power developed on the Tennessee at Muscle Shoals from being put to that use?

Mr. MAYO. There are a lot of other chances for water power on the Tennessee that might be used for that purpose.

The CHAIRMAN. That reminds me. Have you ever given any consideration to that? I wish you would take it up with the committee. What is Mr. Ford's idea about, for instance, the building of reservoirs? Has he considered that subject?

Mr. MAYO. Oh, yes.

The CHAIRMAN. Have you, as an engineer, gone over the country to see whether there are places where at reasonable cost you could get reservoirs on the Tennessee or its tributaries?

Mr. MAYO. I have not gone over the country, but I have gone over the maps and the history of the watershed.

The CHAIRMAN. What is your judgment about that? I am confining my remarks now to the tributaries of the Tennessee—the Tennessee and its tributaries.

Senator HARRELD. The watershed of the Tennessee?

Mr. MAYO. Mr. Ford assumes, if he gets this project and he creates a demand for the greater part of this power, he will then turn his attention toward other storage reservoirs to increase his primary power.

The CHAIRMAN. He would have to secure additional legislation to do it, would he not?

Mr. MAYO. Yes, sir. He is willing to let that stand on its own bottom when he comes to it.

The CHAIRMAN. What is your judgment about the possibilities in that respect?

Mr. MAYO. I think the possibilities are very great.

The CHAIRMAN. Are they?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Of course, if that could be done it would be a wonderful increase of power and it would cheapen all the power very much.

Mr. MAYO. It not only can be done, but, personally, I think it is the only thing to do.

The CHAIRMAN. How much primary power do you figure, without any storage dams, will be developed at Dam No. 2?

Mr. MAYO. About 100,000 horsepower. The minimum year is down around 90,000 horsepower.

The CHAIRMAN. Now, then, how much additional secondary power can be developed there, where the power will be obtainable at least six months in the year?

Mr. MAYO. About 400,000 horsepower over a six months period.

The CHAIRMAN. And that would be about as much of secondary power as you could count on being valuable, would it not? If that is not right, how much, in your judgment, would it be?

Mr. MAYO. About one-third of your secondary I would consider.

The CHAIRMAN. You mean only four months?

Mr. MAYO. Not four months, but one-third of the amount that is available for six months.

The CHAIRMAN. I don't understand just what you mean. Of course, secondary power depends for its value on its approach to primary power?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Now, then, how many months in the year do you think secondary power would be valuable? I mean, now, when I say six months, that six months of the time they have not the power, and that unless you do reinforce it by other power there would be six months in the year when you would not have it. Would that secondary power up to six months be valuable?

Mr. MAYO. It, of course, all depends on how you could suit your business to it.

The CHAIRMAN. I can see it might make a vast difference.

Mr. MAYO. And while you have a certain amount of secondary power for six months, of course, you have slightly less for seven months, and still less for

eight months. If you take the amount of your secondary power for six months and divide it by three, that third would be quite valuable.

The CHAIRMAN. You would operate a steam plant, now, with Dam No. 2, for eight months in the year?

Mr. MAYO. The steam plant would only be operated about two months.

The CHAIRMAN. Then your secondary water power that you would use would be running 10 months in the year?

Mr. MAYO. Yes, sir. I took the six months quantity of secondary power and divided it by three, which would give you the amount for about eight months that would have some value. Do you get that?

The CHAIRMAN. No, I don't, Mr. Mayo. I don't quite understand you. I don't know that it is very important. I want to get this idea. For ordinary purposes, how much of the secondary power in the ordinary run of business could a man expect to utilize down there? You have 100,000 horsepower that would run all the year around, the maximum power from the dam would run up to over a million, for about 7 per cent of the time, but everybody concedes if you had to have steam for 98 per cent of the time it would not be economical to use that secondary power. I want to get the line where we could use it, where we can afford to use steam power to reinforce it and make it primary power in ordinary business operations.

Mr. MAYO. As it is now planned, 100,000 horsepower is the minimum. During the 100,000 horsepower minimum period you would operate the steam plant as well. That would more than double up your primary power. You have 120,000 horsepower in steam. This would make 220,000 horsepower primary power (including steam auxiliary).

The CHAIRMAN. You mean to operate your steam at full capacity all the time?

Mr. MAYO. No, sir. You would operate the minimum period with 100,000 horsepower primary water and during the minimum period of 100,000 of water supplement it with 120,000 horsepower of steam; you would keep the 120,000 horsepower of steam running until the amount of secondary power rose above that point, and then you would shut down the steam plant and go on with the water power only.

The CHAIRMAN. Now, then, how long in the year, how many months in the year, the ordinary year, carrying out that same policy, would you operate your steam plant?

Mr. MAYO. I would say a maximum of three months, or maybe a minimum of two months.

The CHAIRMAN. That explains what I want to get at. Then, by doing that, running from a maximum of three months to a minimum of two, you would have primary power amounting to about 240,000 horsepower, would you not?

Mr. MAYO. Yes, sir; 220,000 to 240,000 horsepower.

The CHAIRMAN. All right, Senator Harreld. I believe you had a question.

Senator HARRELD. What I started to say is this, Mr. Mayo:

I am frank to say that the objection I have to this contract is the 100-year period. Over a period of 25 or 30 years past there has been a gradual tendency or growth to a sentiment, and a good deal of legislation, tending to control public utilities, and lately it has taken a turn in the Packers' cases, where there is a tendency to control by law the operations of private companies. I am frank to say that if Government control does not regulate those things the only alternative is Government ownership. I am not for Government ownership, but there is a possibility that within less than a hundred years Government ownership will be forced on the people of this country and public sentiment will be behind it, and whenever public sentiment gets behind it, it ought to prevail.

Mr. MAYO. Yes, sir.

Senator HARRELD. Whenever we make a contract of this sort our successors may find it very embarrassing before the hundred years is out. I hesitate to make that kind of contract any longer than that. That is the thing in this contract that sticks in my crop more than anything else.

Mr. MAYO. And it appears to me if this project came under the same class of business that the Government decided to take over, it would necessarily have to fall in the same boat, would it not?

The CHAIRMAN. It looks to me that this is a great deal nearer the class where there is justification for Government ownership, because certainly in one respect one of the principal objects, and without which we never would have done anything at Muscle Shoals, was entirely a Government proposition. That was the Haber process in time of war.

Mr. Mayo. Yes, sir. Well, the Government, as I see it, is more or less of a partner in this project, if it goes to Mr. Ford, inasmuch as Mr. Ford agrees to keep an emergency plant there ready at all times, with its organization right up to date in the most improved state of the art, and it is up to the Government to see that he does it. He agrees to do it in his offer. He also agrees to keep right up on top of the state of the art in making fertilizer, and to make it as cheaply as he can, and he sets out a minimum quantity. The Government and the agricultural interests of the country sit in on that end of it to see that he does it. So that is possibly Government control, or very near it, I would say. You get all the benefit of Government ownership, with the private initiative of somebody who has operated a large business successfully for a long time to push it forward and bring about the very things we are looking for. It looks to me like a pretty good combination. As I have heretofore stated, if before the lease term expires, although he has purchased the nitrate plants, if at any time the Government takes over the ownership of this class of business, I see no reason why it would not have the same authority it would have in taking over any other company. The mere fact that the Government had sold this project to Mr. Ford, or sold him certain rights and interests, I don't think complicates it in any particular.

The CHAIRMAN. We will have to stop now. We will adjourn until 10.30 o'clock to-morrow morning.

(Whereupon, at 12 o'clock, noon, the hearing was adjourned to 10.30 o'clock a. m., Tuesday, May 2, 1922.)

MUSCLE SHOALS.

TUESDAY, MAY 2, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris (chairman) presiding. Present: Senators Norris, McNary, Norbeck, Kendrick, Harrison, and Heflin. The CHAIRMAN. The committee will come to order. You may go ahead, Mr. Mayo.

STATEMENT OF MR. WILLIAM B. MAYO—Resumed.

MR. MAYO. In reference to the questions that you asked yesterday in regard to using the most economical power for making fertilizers: To overcome the objections you have stated, we have inserted the words in paragraph 15, after "nitrate plant No. 2," "using the most economical source of power."

The CHAIRMAN. Of course, Mr. Mayo, I would not have any objection to your using any kind of power, excepting that in the computation of the cost you would count it on the basis of the most economical power.

MR. MAYO. I think this clarification would apply. That is our judgment.

The CHAIRMAN. I think that wording would cover that.

MR. MAYO. Yes.

The CHAIRMAN. I realize if you had all these kinds of power sometimes you would be using all of them.

MR. MAYO. Yes, sir.

The CHAIRMAN. And you might, as a matter of fact, be using the most expensive part for the fertilizer proposition, and that would be immaterial if, when you computed the cost on which you reckoned your 8 per cent profit, you counted it as though you had used the most economical power.

MR. MAYO. That is, out of the total power used for the year's run we would figure the most economical power?

The CHAIRMAN. Exactly; yes, sir.

MR. MAYO. In paragraph 15, also, in subdivision (a), in which we determine by research to ascertain all the improved methods we can find, we have added to that paragraph "and if so found and determined, to reasonably employ such improved methods."

There was some question before the House committee in regard to this research clause. We guaranteed to run a research department, but we did not guarantee to use any improved methods that we found, so we have added those words.

In paragraph 16 we struck out the words "at nitrate plant No. 2," in the third line. That was brought about by some question like, for instance, in regard to Waco quarry, which is really not a part of plant No. 2. All the limestone that we brought from there, or possibly any other source where we could mine phosphate rock, would not be a part of nitrate plant No. 2. So the words "nitrate plant No. 2" were stricken out, to include any fertilizer operations in the Muscle Shoals district.

Senator HARRISON. May I ask in that connection—I see you mention three organizations, namely, the American Farm Bureau Federation, the National Grange, and the Farmers' Educational and Cooperative Union of America. The American Farm Bureau Federation is the organization of which Mr. Howatt is the head, is it not?

MR. MAYO. Yes, sir.

Senator HARRISON. Then the National Grange and then the Farmers' Educational and Cooperative Union of America. Is that the one Mr. Barrett is head of?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Is that right?

Mr. MAYO. I think that is right; yes, sir.

The CHAIRMAN. That is the farmers' union that he is the head of? Is this the same thing?

Mr. WALDO. Yes, sir.

The CHAIRMAN. What is the farmers' organization that Mr. Lyman represents? I wondered why you put in the names of these farm organizations. That is something that is changing continually. With the exception, perhaps, of the grange, they are comparatively new organizations, and there are other representatives of farm organizations now in Washington. It seemed to me when I read it over that that ought to be modified in some way, so as to make it more general.

Senator HARRISON. You have no objection to that?

The CHAIRMAN. I should not think so.

Mr. MAYO. Well, Mr. Ford's plan was to get the three representative organizations in the United States.

Senator HARRISON. You thought those were representative farm organizations and that is why you selected them?

Mr. MAYO. Yes, sir. Those were picked out, and they sat in with us in drawing this paragraph.

The CHAIRMAN. Of course, they would naturally be led to put themselves in, and I have not any objection to any of those organizations mentioned there; but when you get into operation there may be something entirely different. In fact, charges against one of these have been made on the floor of the Senate that it is controlled by men who are detrimental to the interests of farmers.

Mr. MAYO. I might add that those three organizations have taken in with them other minor organizations in discussing the paragraph.

The CHAIRMAN. I know there are other organizations that are very much interested, or at least in the past have taken quite an interest in this legislation.

Mr. MAYO. I think they have all sat in on it and had their say.

Mr. WALDO. They called a meeting to decide on those three.

Senator HARRISON. You would not object to a provision being put in there that, if desired, Congress might change the names of those at any time, would you?

Mr. MAYO. I don't think there would be any objection so long as you keep the three representative organizations.

The CHAIRMAN. You know time may disclose that instead of three representative organizations there may be more or there might even be less. There are times when all these organizations get together and other times when they do not agree.

Mr. MAYO. That is very true; and we thought if we picked three of whatever there might be, that would be a proper number.

The CHAIRMAN. In just the little time I have been in Congress here I have seen all these organizations except the Grange created, and here is a contract that is going to run for a hundred years.

Mr. MAYO. This reads "or their successors."

The CHAIRMAN. I agree with what I think you are trying to reach there, and consider it important to have on this board representatives of the farmers, whoever they may be, but it does not seem to me in a contract that is going to last a hundred years we ought to name them.

Mr. MAYO. That was the intention—to keep the three leading organizations, whatever they might be. That is the thought.

The CHAIRMAN. Another thing that very often happens: Take these three organizations you have named here; I am not making any charge against any of them, but, as I have said already, the charge has been made on the floor of the Senate, and it has received a great deal of publicity, and it has been denied, and been reasserted by others that it is true, that one of these organizations that is named here has been in secret meetings with various corporations which other people allege do not have the interest of the farmer at heart. These organizations were named here; and if there was any attempt made by special interests, the first thing they would attempt to do would be to get

control of that organization, and they might get it. If they did, it would have just the opposite effect to what it is intended to have.

Senator HARRISON. The power is lodged in Congress to give them the right to change the representation, so far as those organizations are concerned. I should think that would satisfy that.

Mr. MAYO. I will study that over this evening and see if we can not make some further suggestion.

The CHAIRMAN. I think you get the idea, Mr. Mayo.

Mr. MAYO. I get your idea exactly.

The CHAIRMAN. And don't you think there is danger of that occurring—that interests that are not friendly to the farmers might get control of the management of this corporation 25, 50, or 75 years from now? The question might be very acute about these representatives, and these farmer organizations might by a concerted effort get under the control of influences that are exactly detrimental to the farmer. For instance, if there is such a thing as it is claimed there is, the Fertilizer Trust, suppose the Fertilizer Trust, at the expenditure, perhaps, of a large amount of money, would work some manipulation by which they would get control of this organization, or get control of the men who represented these organizations, and in that way they would not only nullify what we intend to do here by this kind of a provision, but they would make it just exactly the opposite to what we are trying to accomplish.

Senator HARRISON. This provision, however, says that the President shall nominate for membership on the board not more than seven of these candidates, and they shall be confirmed by the Senate.

Mr. MAYO. Yes, sir. I think that safeguards it very well. If there is any suspicion or charge against any one of the organizations, you can cover it by that.

Senator HARRISON. I should not think there would be any trouble about getting together on a proposition like that.

The CHAIRMAN. I think we are all trying to accomplish the same thing. I don't think there is any doubt about that. Don't you think, instead of naming the organizations—

Senator HARRISON (interposing). I think there ought to be a provision there that the Congress could change it at any time they should see fit, by a majority vote, if such a situation should arise as you name, and it is possible. Certainly, Congress ought to have a right to change that contract to that extent.

Mr. MAYO. I would like to have you hear some of these organizations, as the House committee did.

The CHAIRMAN. Yes. I think we will, before we get through, hear some of them. For instance, the organization that I mentioned awhile ago is the National Board of Farm Organizations, I think, a sort of an organization of organizations. Mr. E. A. Lyman is the secretary, and has been here several years, and I think, has the confidence, as far as I know, without question, of the farmers and the Members of Congress with whom he has come in contact. It may be that that is included there.

Mr. MAYO. I think it is. I think he has been consulted on the matter.

The CHAIRMAN. I think we can arrange that so it will be satisfactory.

Mr. MAYO. My understanding is that that paragraph has been placed in the hands of every farm organization of every nature in the country.

Senator HARRISON. They are the three outstanding farmers' organizations today.

Mr. MAYO. We thought so, and do yet think so.

The CHAIRMAN. Well, I am not questioning that.

Mr. MAYO. I know, you are not, and I get your point exactly.

The CHAIRMAN. The point I make is that this contract runs so long. If it was going to be for a couple of years, we would take conditions as they are, but I have an idea in five years from now we will probably have an entirely different lot of representatives here. There may be organizations named differently entirely, and they may change again and again. They change like the complexion of Congress changes, and an organization that to-day may be representative of the farmers in 10 years from now may be really representative of the Fertilizer Trust or the Steel Trust, or something of that kind.

Mr. MAYO. Well, if it is so framed as we have it now, to include merely the three leading organizations, whoever they may be, it would meet your criticism?

The CHAIRMAN. Yes; I think so.

Senator HARRISON. It seems that these farmer organizations may each designate not more than seven candidates for this board. They do not have to be members of these organizations, the American Farm Bureau Federation, the National Grange, or the Farmers' Education and Cooperative Union of America. They are simply named by these three organizations. They may go outside of their organization and select them, and then out of the 21 they nominate the President selects and sends to the Senate 7.

Mr. MAYO. Yes.

Near the end of paragraph 15 you will note we have struck out "the said board shall also determine the equitable territorial distribution of fertilizer products produced at nitrate plant No. 2." There was some question as to whether we had that fully explained. That is, our intentions were to deliver these fertilizers directly to the consumers' hands. So we rewrote a new sentence which we have inserted, which makes it a little more explicit. Is there any criticism in regard to that?

Paragraph 17 refers wholly to the United States Government taking over the plant in case of an emergency.

Paragraph 18 is in reference to this 100-year lease period, and you will notice we have struck out at the latter end of the fourth line the preference that was written in, which has been changed to read, "prescribed by Congress," leaving it wholly within the power of Congress to determine what any renewal of the lease may be.

Paragraph 19 sets out the method of procedure in case any of the terms of the contract are violated. It is so written, I think, that it insures the fulfillment of the contract as a whole, or any part of it.

Paragraph 20 simply relates to the contract being accepted as a whole and not in part.

Senator McNARY. I would like to ask a general question, if you please, Mr. Chairman, involving the money transaction.

In the Ford offer you propose to give to the Government \$5,000,000 in exchange for the two nitrate plants, the two steam plants furnishing supplementary power, the Gorgas plant, the 88 miles of transmission line, the rock quarry, all of which cost the Government practically \$90,000,000. Is that correct?

Mr. MAYO. That is correct, yes, sir.

The CHAIRMAN. And you ought to include in that, Senator, the working material there, the railroad and other material.

Senator McNARY. Other physical property.

The CHAIRMAN. Yes.

Senator McNARY. Then you want the Government to complete the construction of Wilson Dam, or Dam No. 2, at an approximate cost of \$10,000,000?

Mr. MAYO. Yes.

Senator McNARY. Then you want the Government to construct dam No. 3 at an estimated cost of from \$40,000,000 to \$50,000,000?

Mr. MAYO. Yes.

Senator McNARY. Upon those two investments you return to the government 4 per cent. Is that correct?

Mr. MAYO. We return to the Government 4 per cent annually. That is the lease price on the total cost of the two dams.

Senator KENDRICK. Might I interrupt there?

The CHAIRMAN. Yes.

Senator KENDRICK. As I understand the proposition, it is 4 per cent upon the additional cost and not on the amount already invested. Is that true?

Mr. MAYO. That is correct, yes, sir.

Senator McNARY. There is no return to the government on the \$90,000,000, in the way of interest? All the compensation the Government receives is \$5,000,000, and you have the property outright?

Mr. MAYO. Oh, no; they receive compensation due to keeping the plant in emergency readiness at all times.

Senator McNARY. I am speaking of cash outlays now. You return to the Government for all this property which I first mentioned \$5,000,000 and that ends that transaction so far as the money consideration is concerned?

Mr. MAYO. It costs money to keep it in readiness.

Senator McNARY. That is a question of maintenance. I am directing my questions to the amount of money that actually would be transferred from Mr. Ford to the Government, and that is \$5,000,000, is it not?

Mr. MAYO. That is \$5,000,000, but we have got to spend money all the while to carry out the terms of the contract.

Senator McNARY. I got a little confused on the first answer. I hate to repeat it again. I tried to outline the physical property that you are getting for \$5,000,000, and which cost the Government \$90,000,000. I think we agreed on that?

Mr. MAYO. Yes, sir.

Senator McNARY. That ends Mr. Ford's obligation for those properties, does it not?

Mr. MAYO. I don't think so.

Senator McNARY. Then, where is it? That is what I want to know. I am just asking for information myself.

Mr. MAYO. Well, he keeps the nitrate plant in emergency readiness for the whole term of 100 years—which costs a great deal of money.

Senator McNARY. Yes; but he is operating it during that time, is he not, for manufacturing purposes?

Mr. MAYO. But he is not operating all of the apparatus that he has to keep in emergency readiness.

Senator McNARY. You make the point that Mr. Ford is returning something to the Government by reason of the fact that for 100 years he is keeping nitrate plant No. 2 in readiness to make explosives in time of war?

Mr. MAYO. Yes, sir.

Senator McNARY. I consider that nil from the fact that at the same time you are manufacturing fertilizer on the contract out of which Mr. Ford makes a profit.

Mr. MAYO. Surely he makes a profit, but in making the fertilizer he does not have to keep all of the apparatus in order that he has to keep in readiness in order to make explosives in time of war.

Senator McNARY. Do you think that is a considerable element in the way of compensation to the Government?

Mr. MAYO. Depreciation on the plant as a whole has been estimated at \$2,350,000 annually.

NOTE.—The estimate of the Ordnance Department on the depreciation of nitrate plant No. 2 is 5 per cent on \$47,000,000, or \$2,350,000 annually.

Senator McNARY. In its present form—not being used?

Mr. MAYO. Yes, sir.

Senator McNARY. Well, that perhaps is correct. Now, following that a little further, the investment that I mentioned a moment ago—the completion of Wilson Dam and the construction of Dam No. 3—that money is to be put up by the Government?

Mr. MAYO. Yes, sir.

Senator McNARY. Upon that you pay 4 per cent, don't you?

Mr. MAYO. Yes, sir.

Senator McNARY. Is there anything else returned to the Government for this vast property?

Mr. MAYO. We pay 4 per cent on the cost of the dams and the maintenance, also a sinking fund to wipe out its entire cost.

Senator McNARY. That is the entire cost of Dam No. 3?

Mr. MAYO. The entire cost of both dams; to complete the work.

Senator McNARY. That is the completion of Wilson Dam?

Mr. MAYO. Yes, sir; and also Dam No. 3.

Senator McNARY. And not the amount that has up to this time been invested by the Government?

Mr. MAYO. We are of the opinion that the amount we have named will wipe out the original cost of the work done on Dam No. 2.

Senator McNARY. That is all.

Senator KENDRICK. I wanted to ask Mr. Mayo on what principal would you deduct the amounts already invested in the dam in estimating the amount on which the Government has a return? As an illustration, you believe that the investment already made has been made with good engineering judgment and good construction, don't you?

Mr. MAYO. Yes, sir.

Senator KENDRICK. The additional amount would not be any more part of the construction than that that has already gone in, and on that ground I am curious to know why you would not include the return on that amount, or why you do not provide that the return should be on the entire investment in the dam.

Mr. MAYO. The work that has been done was done during the war-time period and probably could have been done for about half what it did cost.

Senator KENDRICK. In any event there is no plan for return on any of it here, is there?

Mr. MAYO. We are offering 4 per cent of the cost to complete, but the sinking fund that we establish we think will wipe out all of the original cost as well.

Senator KENDRICK. Yes; but you do not plan to give the Government any return on the amount already invested, which you agree has been carefully and conservatively done, do you?

Mr. MAYO. No, sir.

Senator KENDRICK. It seems to me that that is as much an essential part of the dam as the amount we are now to use in completing it.

Mr. MAYO. That is very true.

Senator KENDRICK. Perhaps it would not be fair to charge up the full cost, because of the unusual conditions under which the construction was carried on, but it would seem unbusinesslike on the part of the Government to arrange that they should have no return on money that has been sensibly invested.

Mr. MAYO. Well, Mr. Ford thought that some part of this investment was properly chargeable to navigation.

Senator KENDRICK. That might be true.

Mr. MAYO. And of course, in estimating what he was able to pay—

Senator KENDRICK. But, Mr. Mayo, is it not quite possible to determine what part of the whole cost of the dam could be satisfactorily or consistently charged to the locks and the navigation feature?

Mr. MAYO. Engineers' estimates place it around eight and a half millions.

NOTE.—The Board of Engineers for Rivers and Harbors fixed the amount chargeable to navigation as \$8,575,000 in 1913. (See R. and H. Comm. Doc. 20, 63d Cong., 2d sess.)

Senator KENDRICK. Eight and a half millions when it is completed?

Mr. MAYO. Yes, sir.

Senator KENDRICK. And, Mr. Chairman, do you recall how much is invested in the dam up to this time?

The CHAIRMAN. About \$17,000,000.

Senator KENDRICK. \$17,000,000; yes.

Another question. I notice this concluding paragraph provides for acceptance or rejection—acceptance of the entire contract without modification. I ask for information. Does not the water-power act limit the lease of such power to a period of 50 years?

The CHAIRMAN. Yes. That is true, Senator.

Senator KENDRICK. I recall during the war what seemed to be a very far-seeing conclusion reached by Secretary Lane in which he said, as I recall his words, that he did not believe that any lease should be granted for a longer period than 50 years, for the reason that he thought that the next generation ought to have the right to pass upon these questions themselves.

The CHAIRMAN. I think all of us who opposed a longer term in the leasing bill held the same view that Secretary Lane did, namely, that no man could tell what conditions would be, and that 50 years was far enough to bind future generations that at that time there might be entirely different conditions, and the Government might want to operate them themselves, or they might want to do something else with them.

Senator KENDRICK. The way we are moving nowadays it would be difficult to say what would be best for us at the end of 10 years.

The CHAIRMAN. Yes. I think you could shorten it down to six months. Mr. Mayo, I want to get a sort of a bird's eye view of the Ford proposition so that it can be understood by those who read the record without going through all the technicalities. I want to go over your testimony now with you in order to get it briefly on the record. As I understand it, the Ford proposition really consists of two parts. Some of this property you propose to buy outright and some of it you propose to lease.

Mr. MAYO. That is correct.

The CHAIRMAN. What you propose to buy is nitrate plant No. 1, No. 2, all the land on which it is located, all the other real estate the Government owns there, railroads, the transmission plant running from there over to Gorgas?

Mr. MAYO. The Government's interest in them.

The CHAIRMAN. The Government owns the transmission line, except it does not own the land on which it is built.

Mr. MAYO. Yes.

The CHAIRMAN. The Government constructed it all. You are going to get title to that from the Government?

Mr. MAYO. Yes, sir.

The CHAIRMAN. And leaving for the moment the Gorgas proposition out—I will more particularly refer to that later, but will leave it out now—then you propose to lease the two dams?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Which you shall construct, but the Government shall pay for their construction?

Mr. MAYO. Correct.

The CHAIRMAN. You propose to pay as consideration for the property you buy \$5,000,000 in installments as provided in your proposition, and you propose to pay to the Government for the dams which you will lease 4 per cent of the money that it costs to build them, commencing now?

Mr. MAYO. Yes, sir.

The CHAIRMAN. That is the cost commencing now?

Mr. MAYO. Yes.

The CHAIRMAN. And then to pay an amortization that in 100 years will wipe out the cost of the two dams?

Mr. MAYO. That is correct.

The CHAIRMAN. So that in the end of 100 years you will still have title to this property you bought?

Mr. MAYO. Yes, sir.

The CHAIRMAN. But your lease will have expired and you will have no interest in the dams excepting the contract gives you a preferential right in leasing it again. Now, that is correct, is it?

Mr. MAYO. That is correct; yes, sir.

The CHAIRMAN. Now, connected with that is the Gorgas proposition. You buy, in addition to the property that I have enumerated, the Government's interest in the Gorgas plant. You buy that outright?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Now, would you not be able, as a matter of fact, if you got this thing, just as you have offered to take it, just as soon as it is turned over to you to turn right around and sell to the Alabama Power Co. your interest in the Gorgas steam plant for almost enough money to pay the Government the \$5,000,000?

Mr. MAYO. I don't think so. Its original cost, as I understand it, was about \$5,000,000.

The CHAIRMAN. About \$5,000,000. Include with that the transmission line. Would you not say now, as an engineer, that you could sell the Government's interest in the Gorgas plant and the transmission line to it, from the Gorgas plant to Muscle Shoals, for \$3,500,000? Would not that be a fair price?

Mr. MAYO. Well, I don't know the condition of it, but my impression would be that perhaps half of its original cost, or something like that.

The CHAIRMAN. That would be \$2,500,000?

Mr. MAYO. Yes.

The CHAIRMAN. Then, as a matter of fact, you would be able to sell something that is not necessary at all in operating this business, as soon as you get the contract, for half of the money that you have to pay to the Government, and you would get the other property, that cost the Government between ninety and a hundred million dollars, for \$2,500,000?

Mr. MAYO. You would if you figured it out on that basis, but we are not after the Gorgas plant to sell it.

The CHAIRMAN. I know; you don't want to sell it; but at the same time it seems to me that to keep out of difficulty over there and to stay out of lawsuits which will last for several years that is what you would have to do.

Senator KENDRICK. Would it not be necessary in the interest of business judgment for somebody to sell, either the Alabama Power Co. or Mr. Ford?

The CHAIRMAN. One or the other, I think, although Mr. Mayo has said yesterday that he thought they could reach an agreement by which they could operate it together and divide the output. I am not saying they will not be able to do that.

Senator KENDRICK. The only way I see they can do that would be for one of them to run that plant one day and the other the next. That is one way to solve the problem.

Mr. MAYO. Well, Senator, they are not having any trouble now, are they?

Senator KENDRICK. They are not operating that as a competitor. They are operating now with the United States Government, and the United States Government is usually just a victim instead of a competitor.

The CHAIRMAN. I think what they are doing now is that they are leasing this from the Government and paying them \$10,000 a month.

Major BURNS. No, sir.

The CHAIRMAN. Is not that right? What is it, Major?

Major BURNS. It is being operated by the Alabama Power Co., and they pay us a certain amount per kilowatt hour for every unit of energy that is made at that plant.

The CHAIRMAN. How much does it amount to?

Major BURNS. They pay 1½ mills per kilowatt hour.

The CHAIRMAN. How much in money do you get?

Major BURNS. Last year we got, in round figures, \$100,000.

The CHAIRMAN. That includes the transmission line?

Major BURNS. No, sir.

The CHAIRMAN. That includes just the plant over there?

Major BURNS. That includes the steam plant at Gorgas.

The CHAIRMAN. That does not change my proposition very much, it seems to me. It is more than \$10,000 we are getting for it.

Major BURNS. The reason why I spoke about the \$10,000 is that we are getting \$10,000 stand-by charge for the use of plant No. 2.

The CHAIRMAN. Oh, yes. I had that mixed up. I am much obliged to you.

Now, can not recall them just now, but you will remember them, probably—there are some additions and some exceptions to be taken out of this \$5,000,000, are there not?

Mr. MAYO. Not that I recall.

The CHAIRMAN. Maybe I have some provision of this contract mixed up with some other contract.

Mr. MAYO. I don't think there are any.

The CHAIRMAN. Then you could, if you wanted to, without any doubt, if you got this contract, sell so much of it as the Alabama Power Co. wanted, to wit, the Government's interest in the steam-power plant at Gorgas, and the transmission line, and get the balance of this property for, in round numbers, about \$2,500,000? .

Mr. MAYO. Yes, sir.

The CHAIRMAN. Now, let us go to the dams again.

The dams you lease, and you pay 4 per cent interest on what it costs to complete Dam No. 2, and the cost of Dam No. 3, from now on?

Mr. MAYO. Yes, sir.

The CHAIRMAN. You do not pay any interest on what the Government has already spent?

Mr. MAYO. No, sir.

The CHAIRMAN. And the Government must furnish the money to complete the Dam No. 2 and to build Dam No. 3?

Mr. MAYO. Yes, sir.

The CHAIRMAN. While you do the work?

Mr. MAYO. Yes, sir.

The CHAIRMAN. In other words, this Dam No. 2 and Dam No. 3 are built at the expense of the Government?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Where does this 4 per cent under your proposition commence to run?

Mr. MAYO. When we commence to get power.

The CHAIRMAN. For each dam?

Mr. MAYO. Yes, sir.

The CHAIRMAN. It is estimated by the Government engineers that it will take three years to build Dam No. 2?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Is that about your idea?

Mr. MAYO. Approximately.

The CHAIRMAN. Can you do it in less time?

Mr. MAYO. I should think we can do it in about half that time.

The CHAIRMAN. A year and a half?

Mr. MAYO. Yes, sir.

The CHAIRMAN. In the meantime the Government is putting up the money. The Government would not get any interest between the time it put up the

various installments it would have to put up to complete Dam No. 2 and to build Dam No. 3 and the time when the dams are ready to use?

Mr. MAYO. No, sir.

The CHAIRMAN. So the Government would have to take into consideration the fact that in the expenditure of this money, if your estimate is right, running for a year and a half, a portion it would not get any interest on at all?

Mr. MAYO. No, sir.

The CHAIRMAN. And when you started to build Dam No. 3 and the Government put up the money as you constructed it, how long would you say it would take you to build Dam No. 3?

Mr. MAYO. About three years from the time we started work on Dam No. 2.

The CHAIRMAN. From the time you commenced?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Now, then, the Government, under your proposition, would get no interest on any of the cost of Dam No. 3 until the dam was completed and you were using the power?

Mr. MAYO. That is correct.

The CHAIRMAN. In other words, for three years on part of the money it would get no interest?

Mr. MAYO. Well, we had planned to take the money only as we needed it.

The CHAIRMAN. I understand. That is my proposition, that you take it just as you need it, but you would not pay the Government any interest on it until the dam is completed?

Mr. MAYO. That is right.

The CHAIRMAN. That means that there is some money that the Government would be out for three years without getting any return on it?

Mr. MAYO. That is right.

The CHAIRMAN. And that amount would increase, the amount that they would not get any returns on, until the dam is completed?

Mr. MAYO. Yes, sir.

The CHAIRMAN. So that as a matter of fact it is not correct to say that under your proposition the Government is going to get 4 per cent interest on the amount it spends in building that dam?

Mr. MAYO. Well, let us see if we don't want to charge that up against navigation.

The CHAIRMAN. We are already going to charge up against navigation the money that we have put into it already, about \$17,000,000 in that one dam.

Mr. MAYO. There are several ways of looking at it. If we do not sell the nitrate plants you have to keep them in order, and you are up against the continual expense of that, which you might add as a credit against this.

The CHAIRMAN. I think so, and all I am trying to do is to get the picture correct.

Now, I want to go back to that, since you have mentioned it. Senator McNary's question called attention to that, and I think that is true. The Government would have to spend some money in keeping the plant always ready to operate, and you would have to spend some money in keeping the plant ready to operate to make munitions of war on five days' notice?

Mr. MAYO. Yes, sir.

Senator KENDRICK. I wanted to ask a question right there, if the Ford company proposes to keep these two nitrate plants, No. 1 and No. 2, in readiness for use.

The CHAIRMAN. No. They don't expect to use plant No. 1 for nitrates at all. They may make automobiles or something of that kind there.

Senator KENDRICK. Do you propose to keep the whole of plant No. 2, then, in readiness for operation?

The CHAIRMAN. Yes.

Senator KENDRICK. And only use it in the production of this compound that enters into fertilizer?

The CHAIRMAN. Yes. They are going to make nitrates. They are going to make fertilizer with it. That is just what I was leading up to, Senator, when you interrupted me.

Now, you mentioned the cost of keeping plant No. 2 in constant readiness for the manufacture of explosives. In the meantime you are going to use plant No. 2 for the manufacture of fertilizers?

Mr. MAYO. Yes, sir.

The CHAIRMAN. So it is not hardly right, is it, to say that you have got to spend a lot of money to keep Nitrate Plant No. 2 ready to make explosives

when, as a matter of fact, you are going to utilize it yourself in making fertilizer?

Mr. MAYO. Quite a large part of it, Senator.

The CHAIRMAN. There would be some part of it. That part of the plant that you would not utilize or use in making fertilizer but which would be necessary in making explosives you would have to take care of and keep in good shape all the time?

Mr. MAYO. Yes, sir.

The CHAIRMAN. That is a minor part compared with the whole plant, is it not?

Mr. MAYO. Well, it is not so very small. I would say about 33½ per cent.

Senator NORBECK. Who carries the insurance on this property during this period?

Mr. MAYO. Which property do you refer to, Senator? The dams or the nitrate plants, or both?

Senator NORBECK. Yes. The only thing I have in mind is if the nitrate plants should be destroyed by fire who will have to replace it?

Mr. MAYO. Mr. Ford would have to replace it. It is his property. He would have to keep it insured to live up to the terms of the contract.

The CHAIRMAN. Senator, Mr. Ford gets absolute title in fee under his proposition to nitrate plant No. 1 and nitrate plant No. 2 and all the other property that the Government has there. He owns it exactly the same as he owns his factory in Detroit, and he makes no agreement under his proposition in regard to plant No. 1. He gets it. It is his. He can make it into a residence if he wants to, or he can do anything he pleases with it. But he does agree that nitrate plant No. 2 he will operate. I assume if it was destroyed by fire he would have to rebuild it.

Mr. MAYO. Certainly.

The CHAIRMAN. He would very likely keep it insured in the meantime.

Mr. MAYO. Yes, sir.

The CHAIRMAN. It would be just like any other property that he owns?

Mr. MAYO. Yes, sir.

The CHAIRMAN. He would have title to it just the same as he does everything else that he owns?

Mr. MAYO. Yes.

Senator HEFLIN. Except at the end of a hundred years—

The CHAIRMAN. No; he owns it. The only thing that the end of a hundred years cuts any figure in are the two dams. Is not that right, Mr. Mayo?

Mr. MAYO. That is correct.

The CHAIRMAN. He leases those, but he buys the other property. That is what this \$5,000,000 is for.

Senator KENDRICK. Also his obligation as to maintenance of these plants would terminate?

The CHAIRMAN. At the end of a hundred years?

Senator KENDRICK. At the end of his lease.

The CHAIRMAN. At the end of a hundred years the Government owns the dams then as they do all the time, but the Government has paid for them, but Mr. Ford has paid the money back.

Senator McNARY. In amortization.

The CHAIRMAN. Under the amortization plan. The contract is ended. He does not have to make any more fertilizer or explosives, and does not have to keep the plant ready, but that is his plant.

Senator HEFLIN. He buys the plant outright.

The CHAIRMAN. Let me develop that a little.

At the end of a hundred years Mr. Ford owns nitrate plant No. 2 the same as he does at the beginning?

Mr. MAYO. Yes, sir.

The CHAIRMAN. He can tear the machinery out then if he wants to?

Mr. MAYO. Yes, sir.

The CHAIRMAN. He does not need to make fertilizer; he does not need to keep it ready to manufacture explosives, so at the end of a hundred years we find ourselves in this position: The Government will own the dams clear of any lease to Mr. Ford. They will belong to the Government?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Mr. Ford will own all the other property clear of any lien or obligation to the Government?

Mr. MAYO. Yes, sir.

The CHAIRMAN. The Government has the dams, but it does not have the nitrate plants; it does not have any machinery there for the making of explosives?

Mr. MAYO. No, sir.

The CHAIRMAN. That is all over with?

Mr. MAYO. Yes, sir.

Senator NORBECK. The only obligation the Government has at the end of a hundred years is that Ford shall have the first opportunity to lease that dam?

The CHAIRMAN. That is all.

Senator McNARY. Mr. Mayo, in connection with the making of fertilizer by the atmospheric fixation process, you retain the privilege of making 8 per cent on on investment?

Mr. MAYO. Yes, sir.

Senator McNARY. The amount of money involved?

Mr. MAYO. Yes, sir.

Senator McNARY. All of which is Government money, upon which you pay 4 per cent?

Mr. MAYO. No, sir.

Senator McNARY. Where do you pay more than 4 per cent?

Mr. MAYO. You say all of it is Government money?

Senator McNARY. All money you get outside of, as the chairman has so well illustrated by the picture he has drawn—and I don't want to go over the ground—that you get, as you say, for \$5,000,000, and as he says for \$2,500,000; that is, all the physical property that he mentioned?

Mr. MAYO. Yes, sir.

Senator McNARY. But all the Government puts up for the completion of Dam No. 2 and for the building of Dam No. 3 you pay 4 per cent on?

Mr. MAYO. Yes, sir.

Senator McNARY. So whatever investment the Government makes, you never pay more than 4 per cent?

Mr. MAYO. That is correct.

Senator McNARY. But in the sale of fertilizer to the farmer you retain the right to make 8 per cent?

Mr. MAYO. Yes, sir.

Senator HEFLIN. You invest a great deal of your own money in the enterprise?

Mr. MAYO. Would you want to take a chance on a business enterprise at less than 8 per cent?

Senator HEFLIN. Is it not true that you are going to invest millions of your money in this industrial proposition? You are going to put up there millions of your own money in connection with the money expended by the Government, are you not?

Mr. MAYO. Yes, sir. That is correct.

Senator HEFLIN. You are reserving the right to make 8 per cent on the money that you invest; is not that right?

Mr. MAYO. That is right.

Senator McNARY. I think the chairman has clearly demonstrated by the questions he has asked and the conservative figures that he used that you will have invested two and a half million dollars for all this property. I think you conceded that a moment ago, and you do now, don't you?

Mr. MAYO. No, sir.

Senator HARRISON. That is the amount the Government would be paid, but how much would you expend yourself in getting these plants?

Senator McNARY. What sum of money in addition to \$2,500,000 are you going to invest, and for what purpose?

Mr. MAYO. If we should sell the Gorgas plant we would have to replace it with some other, but we do not anticipate selling it. It is very necessary.

Senator HARRISON. Let us omit the Gorgas plant.

Mr. MAYO. It is very necessary.

The CHAIRMAN. You don't have to have the Gorgas plant. I concede it is a good property, and I would like to have it myself. It is a good property, because it makes cheap power, but you could take this proposition and eliminate Gorgas entirely. There is that big steam plant at nitrate plant No. 2 that is in perfect running order, as good as any in the world of its kind. There is the steam plant at nitrate plant No. 1, a much smaller steam plant, that is ready to start up to-morrow and operate in perfect condition, and everything modern. In nitrate plant No. 1 the thing that is not any good is the machinery that is in there to make nitrates. The buildings are in perfect condition, conceded to be,

well built. The steam plant has nothing whatever wrong with it. It is the last word in steam plants, and you could use either one or both of those in your operations, and I think it was the intention originally of the Government to do that, if the war had lasted, and the only reason they got Gorgas was because they wanted something to furnish them power in the meantime. They wanted to utilize power for the purpose of building these great plants there. That is the reason they went into this deal with the Alabama Power Co., I suppose. I have been told that is the reason.

Mr. MAYO. Then let me ask you this: Why has the Government used Gorgas power ever since No. 2 steam plant has been finished?

The CHAIRMAN. Yes; I understand that the Gorgas power, so the engineers tell me, they can buy from the Alabama Power Co. in the amount that they want to use to work on Dam No. 3, and can buy it cheaper than they can operate the steam plant at nitrate plant No. 2, because it is so large and produces so much more power than they need there.

Mr. MAYO. Yes, sir; that is the point.

The CHAIRMAN. So it is cheaper for them to buy that power because, in the first place, it is a very cheap power considering the fact that the Government owns the transmission line.

Senator KENDRICK. The Government has an enormous investment in the power plant itself.

The CHAIRMAN. Yes. That is the reason, as I understand it, the Government operates that. I would assume if you were building there you would get your power to work on that dam where you could get it cheapest, and that would be of the Alabama Power Co., very likely, and you would continue to buy their power until you had Dam No. 2 finished. When you had Dam No. 2 finished you would have cheaper power than the Alabama Power Co. You would have the water power then.

Mr. MAYO. Yes, sir.

The CHAIRMAN. Would not this be a reasonable proposition, that while it is very desirable that you have the use of that transmission line and the Government interest until you completed Dam No. 2, you could easily arrange with the Alabama Power Co. so that they could get out of this difficulty and you could get out of it, by some understanding by which you would be able to have and use that until you finished Dam No. 3, and then sell it to them, when you would not have so much use for it?

Mr. MAYO. That is all possible, Senator, but you overlook a few facts. The steam plant at nitrate plant No. 1 is a direct-current plant. It is of no use in distributing current to any distance.

The CHAIRMAN. That is at No. 1?

Mr. MAYO. That is at No. 1.

The CHAIRMAN. That is the steam plant?

Mr. MAYO. Yes, sir. And it is only 5,000 horsepower as well, so you must almost entirely eliminate that from the power proposition. Anything that we might do at nitrate plant No. 1, we might get power from that plant for that purpose, but it is only 5,000 horsepower.

The CHAIRMAN. In other words, as I understand it, it would not be practical to use that 5,000-horsepower steam plant at nitrate plant No. 1; you would probably tear out this old machinery and put in some manufacturing establishment, and then you would use that steam plant that is right there with it?

Mr. MAYO. We may or may not. We can not tell how well it will work in.

Senator NORBECK. May I ask another question? With the development of dam No. 3 will you not need more steam power than the present power plant at No. 2?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Now, let me interrupt there. He would not need more steam power, Senator, for any governmental operation, but, of course, you can build manufacturing establishments and keep on and build enough of them so you would have use for more power than all of this put together, I suppose.

Senator NORBECK. But the idea is that your primary horsepower would be low unless you can supplement it with steam power.

The CHAIRMAN. You would have steam power enough there to supplement the primary power?

Senator NORBECK. That No. 2, then, is enough for both dams, is it not?

Mr. MAYO. The point is that as your primary power increases you must have the supplementary steam power; your supplementary steam power must increase in the same ratio.

Senator NORBECK. You mean with the additional power that you will get from these dams, in order to get economical operation, you would need additional power to what the present steam plant will furnish. Is that it?

Mr. MAYO. Yes, sir.

Then in regard to the steam plant at nitrate plant No. 2, the minute you strike a low-water period you dislike to start up an 80,000-horsepower unit. It is too large. If you had something about half the size it would make the plant much more flexible and you would start up the small unit first, and when the water got down lower and you needed to add to the capacity of the dams a little more, then you would start up the larger one and shut down the smaller one, and go up to its capacity, and then finally throw in the small one again.

The CHAIRMAN. In speaking of that, Mr. Mayo, there are several units in plant No. 2, and one that is not yet installed. Is not that true?

Mr. MAYO. There is only one unit in steam plant No. 2. It is subdivided into three parts.

The CHAIRMAN. You could run one of those parts without the other two?

Mr. MAYO. You can, but it is not economical to do it.

The CHAIRMAN. Could you not put in another one there? There is still room there?

Mr. MAYO. Yes, sir; that is the point I am arriving at.

The CHAIRMAN. You could put that in and operate it by itself, could you not?

Mr. MAYO. Yes, sir. And that is the logical thing to do if we do not have the Gorgas plant, and in that case we would put it in right away.

The CHAIRMAN. Yes. As I understand it now, nitrate plant No. 2, while they have about 80,000 horsepower steam there—

Mr. MAYO. Yes, sir.

The CHAIRMAN. The building and everything else is constructed with an idea of putting in another unit of 30,000?

Mr. MAYO. That is correct.

The CHAIRMAN. And the place is there. All you have to do is to put in the machinery?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Everything else is there?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Would it not be the economical thing to do to put that in, and if you did not want to operate your 80,000 horsepower, you could operate your 30,000?

Mr. MAYO. Yes. That is, if you didn't have Gorgas. You would operate Gorgas in preference to it, because it is cheaper power.

The CHAIRMAN. The reason it is cheaper is on account of the fuel. It is not more modern in any respect?

Mr. MAYO. No, sir.

The CHAIRMAN. But it is located at the mouth of the mine.

Mr. MAYO. But it is located at the mouth of the mine; yes, sir.

The CHAIRMAN. Which is cheaper? It is cheaper to transport the power in the shape of electricity over the transmission line than it is to haul the coal?

Mr. MAYO. That is correct; and when your No. 3 dam is finished, then your No. 2 steam plant, with both units in and Gorgas added, you are still deficient in auxiliary power.

The CHAIRMAN. Yes. Now, is it not probable, and have you not investigated enough to reach the conclusion that instead of bring coal across by rail you can easily develop coal mines upon the Tennessee River and transport it by boat on the Tennessee River after these dams are completed?

Mr. MAYO. I think we may have to. That is the probable plan.

The CHAIRMAN. So that eventually, when these dams are finished, the probabilities are that coal to supply the steam plants at plant No. 1 and plant No. 2 will be brought down the river instead of being hauled across by railroad?

Mr. MAYO. Yes, sir.

The CHAIRMAN. And when that happens, it will cheapen the cost?

Mr. MAYO. It will cheapen the cost of getting coal at nitrate plant No. 2, but it will never be as cheap as Gorgas, which is right alongside the mine. But I make the point again that with the two units in No. 2 and the Gorgas plant, when both dams are finished, you are still deficient in steam power.

Senator McNARY. Keeping out of mind for the present the \$5,000,000 which Ford pays for these vast properties, what other sums of money does he propose

to invest at Muscle Shoals, so far as affects the interests of the Government and the public?

Mr. MAYO. It is a pretty well established fact that the cyanamid process is not an economical one. The chances are we will have to entirely rebuild that plant.

Senator McNARY. That is, rebuild the plant or remove this machinery and put in other?

Mr. MAYO. I mean the apparatus, not particularly the buildings. There may be some changes in the buildings.

Senator McNARY. That is problematical. You are not certain of that?

Mr. MAYO. It is certain that the cyanamid process is one of the most expensive processes to get nitrates.

Senator McNARY. What sum of money do you calculate will make that change in the process for fixing atmospheric nitrogen?

Mr. MAYO. The changes may run perhaps \$15,000,000.

Senator McNARY. Have you made any estimate on this line so that you can make an accurate statement?

Mr. MAYO. There is nothing accurate about it; no, sir.

Senator McNARY. So the other sum of money to be expended by Mr. Ford would be in changing the process for the making or fixation of atmospheric nitrogen?

Mr. MAYO. Yes, sir.

Senator McNARY. Can you charge that all up to the Government? Would not some benefit inure to him by making fertilizer? Is that all invested in behalf of the Government? Is not that all investment that he makes from a business standpoint?

Mr. MAYO. That is one of them. He will make a profit out of the other materials, of course.

Senator McNARY. Then it is not fair to say that he needs all of this property for a small amount of money because he is lending a public service?

Mr. MAYO. It depends on what you define as a public service.

Senator McNARY. I define as a public service the fixation of atmospheric nitrogen to be sold at fair and reasonable prices to users of fertilizers.

Mr. MAYO. All right. Then the less you pay for the plant the less the amount the farmer will have to pay for his fertilizer, because all you charge against it in your cost is your capital cost, whatever it may be.

Senator McNARY. And you would make no capital charge against the nitrate plants, because you get them for practically nothing?

Mr. MAYO. We get them for whatever they cost.

Senator McNARY. You know what they cost. Why quibble about it?

Mr. MAYO. I am not quibbling. I am trying to keep you straight.

Senator McNARY. We know what it cost—\$5,000,000.

Mr. MAYO. All right.

Senator McNARY. We know the original investment was \$90,000,000, and you are offering \$5,000,000.

Mr. MAYO. The point I make is that the farmer only pays interest on the capital cost, whatever it is.

Senator McNARY. Oh, yes. If the Government would give you the plant and subsidize it, you can make fertilizer for nothing. That is not the point I am trying to develop.

Senator KENDRICK. Mr. Mayo, I want to ask you, Is it not true that the obligation to manufacture nitrates is dependent upon your ability to do it at a profit of 8 per cent on the investment?

Mr. MAYO. No, sir.

Senator KENDRICK. So that you could make a profit of 8 per cent?

Mr. MAYO. Not necessarily.

Senator KENDRICK. Now, is it not your belief, not a probable thing, but is it not your conviction that within a very short time we shall come to a time when cheaper money will enable us to operate almost any kind of a business at a lower rate of income?

Mr. MAYO. I think so. Of course, that will always fluctuate.

Senator KENDRICK. And, as Senator McNary has pointed out, in view of the fact that the Government has invested such a large share of this money in the original plant, do you not believe that your company could easily afford to content themselves, or get along with a profit equivalent to the amount that they pay the Government for money, say, 4 per cent?

Mr. MAYO. No, sir. The prime reason for getting the money at 4 per cent is to keep your cost as low as possible. Eight per cent we consider a very small

profit manufacturing, considering the risk, because you may go years and make nothing.

The CHAIRMAN. Yes; I understand; but if you did that you would only be in the same class for that length of time with the farmers of the country who go year after year without making anything.

Mr. MAYO. Yes, sir.

Senator KENDRICK. And they are the people we are trying to reach with the manufacture of these fertilizers.

Mr. MAYO. Mr. Ford is starting in this business as anybody would start in any business, taking the usual business risks, and he limits himself to a profit of 8 per cent.

Senator KENDRICK. Well, I could understand the merits of that position if Mr. Ford were making the original investment. But, as it happens in this case, as I see it, you could easily charge up to the power plants your transmission lines and those things, all of the cost and whatever is now invested in those cyanamid plants that is usable would be that much, without any capital cost—would be operated without any capital cost. I ask in that connection, Mr. Chairman, what did that steam plant cost that is located near Dam No. 2?

The CHAIRMAN. Which one, Senator?

Senator KENDRICK. The large steam plant.

The CHAIRMAN. Major Burns says \$12,000,000.

Senator KENDRICK. I just want to ask one more question.

Mr. MAYO, don't you believe that that plant, as it stands to-day, taken in connection with the dam as it will stand when the dam is completed, would be worth \$5,000,000?

Mr. MAYO. Well, that all depends on what you can do with it.

Senator KENDRICK. Well, used in connection with the dam as increasing the amount of primary power that you would receive from the dam by reinforcing it.

Mr. MAYO. You must, of course, build your business up to absorb your power. You might view this project from the angle that it takes considerable nerve to go to this more or less virgin country and invest the large amount of money necessary to economically absorb all the power that can be developed at these two dams. When the dams are completed and the power developed, interest payments begin and it necessarily follows that you have to build large industrial plants to absorb the power, which will probably mean an investment of approximately \$50,000,000, and the accepting of a huge manufacturing risk.

Senator KENDRICK. Taking it from that standpoint, I will ask you another question about it.

Is it not your opinion that if the Government proceeds to complete the dam, allowed its investments to stand as they are, within 30 days after the dam was completed, whether it was one or two dams—we will say No. 2 to begin with—if that dam were completed, at the end of three years' time the Government could within 30 days secure a return on that investment that would take care of this 4 per cent return?

Mr. MAYO. I don't think they could.

Senator KENDRICK. Right in that neighborhood?

Mr. MAYO. No, sir.

Senator KENDRICK. In my opinion they could. They are paying higher prices for steam power all over the country for manufacturing plants than the Government would find it necessary to charge for water power; otherwise the water power would be a failure.

Mr. MAYO. Well, of course, that dam will furnish primary power of about 100,000 horsepower, and a maximum of about 600,000, and there is nothing that I know of in that section of the country that would absorb anywhere near that amount of power.

Senator KENDRICK. Not within a hundred miles?

Mr. MAYO. No, sir. And, of course, even though you could absorb the primary, then there is all the secondary that goes to waste.

The CHAIRMAN. Senator, you must not confine your distance to a hundred miles. Put that 300 miles—a radius of 300 miles.

Senator KENDRICK. I suppose that would reach Chattanooga.

The CHAIRMAN. Three hundred miles would reach New Orleans.

Senator KENDRICK. Yes; I understand, by building these transmission lines there is no question about it, but there is so much opportunity to employ power within a radius of a short distance there that it ought to take care of this income charge, this interest charge of 4 per cent.

Senator HEFLIN. I was going to ask you, Mr. Mayo—Senator Kendrick asked you a question about the amount of money already invested by the Government at Muscle Shoals, and then suggested the smaller amount that you might pay in connection with your desire to make 8 per cent on the investment. It is your plan to make 8 per cent on the cost of production of fertilizer?

Mr. MAYO. Yes, sir.

Senator HEFLIN. So, if you get the Government's equipment given to you you could produce fertilizer at a smaller cost to the farmers?

Mr. MAYO. Yes, sir.

Senator NORBECK. I am not sure that I understand what will be considered the capital cost in this deal. You start out with an investment of \$5,000,000, but it covers additional property besides the property you intend to use for fertilizer?

Mr. MAYO. Yes, sir.

Senator NORBECK. Might it not be argued that you are paying for the other property and you get this for nothing, and therefore there should be no capital charge against this part of the property?

Senator KENDRICK. That is the question I asked a moment ago, exactly.

Mr. MAYO. I did not so understand you.

Senator KENDRICK. My idea was you could charge up the other properties to the \$5,000,000 until it had been entirely absorbed, and that this cyanamid plant might stand. If you chose to figure it in that way, or it might represent or might come to you for nothing, at no cost. Now, in that event my contention was that you could afford to manufacture fertilizers there on the basis of income or return the same as you use the Government's money, 4 per cent.

Mr. MAYO. Well, it is not a question of what you—

Senator KENDRICK. In this proposition you limit your responsibility of operation to 8 per cent, don't you?

Mr. MAYO. Yes, sir.

Senator KENDRICK. You must have that. It is my contention that if you had this plant for nothing you might be willing to reduce that limitation to 4 per cent profit.

Mr. MAYO. Well, I don't think it would be a good business risk. Eight per cent is your maximum profit. As I said before, you might have to run at times with nothing, or even at a loss. Every manufacturing business is so operated that at times they make up, say, 20 per cent, or something of that kind.

The CHAIRMAN. Of course, under your proposition here you could not do that?

Mr. MAYO. No, sir. Our maximum is 8 per cent. It seemed to us that that was the lowest safe margin.

Senator KENDRICK. Then does this 8 per cent rate mean an average rate of 8 per cent, and if so, over what period of time?

Mr. MAYO. Eight per cent annually, we say.

Senator KENDRICK. Eight per cent annually?

Mr. MAYO. Yes.

The CHAIRMAN. Of course, there might be, Mr. Mayo, a chance for a difference of opinion as to what you should use as the basis for computing your 8 per cent.

Mr. MAYO. Exactly, and we have so written in the offer that this board sits in on our books and costs.

The CHAIRMAN. Yes. For instance, you pay \$5,000,000 for property, some of which is properly chargeable to fertilizer, but it is quite evident that not all of it is.

Mr. MAYO. Surely not.

The CHAIRMAN. You buy a good deal of other property?

Mr. MAYO. Yes.

The CHAIRMAN. And it might be a subject of great controversy as to just how much of that should be charged up to capital cost of the fertilizer business.

Mr. MAYO. Exactly, and it has always been our intention—

Senator KENDRICK. That is not made clear in the contract, is it?

The CHAIRMAN. The contract, as I understand it, recognizes that difficulty, and—

Mr. MAYO. Yes, sir.

The CHAIRMAN. And sets up a method to ascertain what is right.

Mr. MAYO. And the intention has always been to subdivide it so that only that part of the plant that makes fertilizer shall be included in the capital cost.

The CHAIRMAN. That is the reason, Senator Kendrick, I think, that the naming of these farm organizations in the contract becomes a very important proposition. If they should become controlled by some trust, where their interests would be against the farmer, it would be to their interest to make fertilizer cost as much as possible, whereas what we are trying to do is to get it as cheaply as possible.

Mr. MAYO. Yes, sir.

Senator KENDRICK. I think I agree with you completely, Mr. Chairman, but it does seem to me to be important that a contract extending over a long period of time might be made flexible as to the limitation of earnings. You have an arbitrarily fixed rate of earnings of 8 per cent. Before we are through with this thing all credits—and I mean sound credits—we are going to make the satisfactory income on an ordinary business a very much lower rate than we have it now.

The CHAIRMAN. Your theory, Senator, as I understand it, is that while 8 per cent might be right now, in 50 years it might not be right.

Senator KENDRICK. It might be entirely in error, Mr. Chairman, in 10 years.

The CHAIRMAN. Yes; it might.

Mr. MAYO. Do I understand you to say that you think it may be entirely too large?

Senator KENDRICK. Quite so, to make it a prohibitive thing, as you have here. It would be entirely optional with you, as I understand your contract, as to whether you manufactured any fertilizer or not in case you are unable to make a profit of 8 per cent. Now, the conditions might be such within five years' time—and I believe they will—

The CHAIRMAN. Is that your understanding, Mr. Mayo?

Mr. MAYO. No.

The CHAIRMAN. I did not get it that way.

Mr. MAYO. I was waiting until he finished.

The CHAIRMAN. I think, Senator, you are wrong about that.

Senator KENDRICK. Is it not written in your contract unless you can make 8 per cent—

Mr. MAYO. No; it is not.

The CHAIRMAN. I thought a while ago that there was a misunderstanding between you. You didn't understand his question.

Senator KENDRICK. Suppose you could not make 8 per cent. Suppose you could not make any profit, but had to go on manufacturing at cost. Is there any provision there that would compel you to proceed?

Mr. MAYO. That is entirely covered. I made the statement when I was asked if Mr. Ford would run at a loss that if he operated at a loss after exhausting every possible effort and using every modern device that he could to make it at a profit, if he still was operating at a loss and continued to do so, I thought he could come to Congress and get relief on the contract. But the way this contract is written there is no allowance for that at all.

The CHAIRMAN. My understanding of this proposition is that under this offer Mr. Ford would have to make fertilizer whether he made a profit or whether he did it at a loss, but that he could not make more than 8 per cent. Is that your understanding?

Mr. MAYO. That is correct; yes, sir.

Senator KENDRICK. Would he have to continue to make a fixed amount without regard to profit?

The CHAIRMAN. To the capacity of this plant.

Mr. MAYO. The amount stated here is the minimum amount, too.

The CHAIRMAN. One hundred and ten thousand tons of ammonium nitrate annually?

Mr. MAYO. Yes, sir.

Senator KENDRICK. Well, that is quite a different phase.

Mr. MAYO. I am confident, and I think Mr. Ford is, that if the time ever came that he had exhausted every effort and could not make fertilizer as cheaply as it was being made elsewhere, for some unknown reason—that is, unknown to-day—he could come here and get relief from Congress.

Senator KENDRICK. I see no objection whatever to allowing him as much as 8 per cent profit at this time, but I do believe that the time is coming—

The CHAIRMAN. That runs through every provision of this contract and all the others, because we have got such a long time involved. We don't know even in 50 years that conditions may not be so different that the contracts may not be applicable to conditions at all. That is one of the risks we run in leasing now for a long term of years; and in this case, Mr. Mayo, it does seem to me we are making a lease here for 100 years and selling you a plant that you will absolutely own without any obligation to the Government whatever at the end of 100 years; and will future generations not be able to say to a Congress that does that, that by our act now we have robbed them of their just inheritance, as a war proposition, to always have this thing ready for war?

Mr. MAYO. That was argued before the House committee, and that was the reason for cutting out the latter part of paragraph 18. They argued that we were tying up their children's children, and their children, and so on, in making the Government insure us power after 100 years.

The CHAIRMAN. We will have to quit now until 10.30 to-morrow morning.
(Whereupon, at 12 o'clock noon, the hearing was adjourned to 10.30 o'clock a. m., Wednesday, May 3, 1922.)

MUSCLE SHOALS.

WEDNESDAY, MAY 3, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in room 224, Senate Office Building, Senator George W. Norris presiding.

Present: Senators Norris (chairman), Norbeck, and Heflin.

STATEMENT OF MR. WILLIAM B. MAYO—Resumed.

The CHAIRMAN. You may proceed, Mr. Mayo.

Mr. MAYO. When we closed yesterday, Mr. Chairman, you were discussing the terms of the lease, if you will remember.

The CHAIRMAN. Yes.

Mr. MAYO. And you made the point that at the termination of the lease period the Government would not be protected from a military preparedness point of view. I am of the opinion that is not so, because the terms for a new lease are fully within the control of Congress. They can lay down any rule in making a new lease with us.

The CHAIRMAN. Of course, in case of war we could take possession of the plant, no matter who owns it.

Mr. MAYO. Yes, sir.

The CHAIRMAN. The point I wanted to call attention to, Mr. Mayo, is that if we had that we would not have to buy it or pay big damages for it. We already own it now, and the question is whether we ought not to keep it, so we would not have to pay damages in case we wanted to use it for war purposes.

Mr. MAYO. Under the terms of the lease you are protected.

The CHAIRMAN. Yes; we are protected under the terms of the lease.

Mr. MAYO. It is in the hands of Congress to make a new lease on any terms they choose. They can just as well protect themselves in the new lease as they have in this one.

The CHAIRMAN. They could, of course, or they could take it over absolutely and condemn it.

Mr. MAYO. Yes, sir.

The CHAIRMAN. But in either case they are taking somebody else's property and the property would be just the same as mine or anybody else's who never had any deal with the Government at all; if they took it they would have to pay a lot of money to get it. In other words, they have the property now, and don't have to take it, and the Government always loses lots of money, both when it buys and when it sells. That is the only point in it. They could take it, of course.

Mr. MAYO. It seems to me that under the terms of the present lease it would cost them less for this protection than it would if they retained ownership, because if they retained ownership they would have to operate all the while in order to keep down the expense, or be subject to a stand-by expense, holding it in readiness for a time of emergency. Under the terms of this lease they are not only protected in all the ways that they would be protected if they owned the property themselves, but it would be less expensive, and the plant would be fully organized and kept right up with the state of the art in making explosives and improved as time went on. So it seems to me that the Government would be in a much better condition and, as far as I can see, the same

reasoning would apply to a new lease, because Congress could lay down the same rules in a new lease that they have in this one. Is not that logical?

The CHAIRMAN. Oh, yes; it could be done under any terms they pleased in a new lease, but still they would be dealing, in your case, with your corporation that owned the property in fee, clear of any lien of any kind that the Government had, at the expiration of this lease. It would be just the same as though you had started in without any connection with the Government and the Government got into war and took your property. It could not compel you to lease it again. You would not have to re-lease it if you did not want to. It would be making an entirely new contract. The Government, it is true, could refuse to lease it from you without it was protected. That is all true, but the Government would have to pay for it.

Mr. MAYO. Yes, sir. While that contention is true, yet in order to operate the plant it would be necessary to have the power, and we would have to buy the power from the Government. So in a way the Government is linked up with the plant and indispensable to it.

The CHAIRMAN. Of course, at the expiration you would own all this property free of any lien whatsoever on the part of the Government, and the Government would own the two dams free of any claims from you?

Mr. MAYO. Yes; and one is entirely dependent on the other.

The CHAIRMAN. Yes; they might be. Of course, in 100 years from now it may be that you would have all the power you wanted without using the dam.

Senator NORBECK. Maybe wars will be out of style, too, Mr. Chairman, and we would not need this plant.

The CHAIRMAN. I hope that will be true, but I hate to bind future generations on that score. War may be more popular in 100 years from now than it is now. They may have forgotten these things and be ready to start in anew on another world controversy. I hate to tie up unborn generations so that they will be in the same hold we were in at the beginning of this war. It would have been a great thing for the Government of the United States if at the beginning of this war they had what they have down there now.

Mr. MAYO. Yes, sir.

The CHAIRMAN. It would have been a wonderful thing. It is almost impossible to estimate, without drawing on the imagination, just what that would have meant in this war, because I understand the Allies were right to the verge on munitions. They didn't have a 30 days' supply, and 30 days continuous war would have taken everything they had and left them without ammunition. It was really that desperate condition that induced the Government to go into this. I am told, too, that one of the reasons the expenses are so great is that they worked 24 hours a day at times, three shifts, in order to hurry it and get it ready.

Mr. MAYO. This point was brought up yesterday, and in thinking it over it seemed to me that the Government was in every way better protected with this sort of arrangement than it would be if they kept ownership of the property. And, reasoning along those lines, it seemed to me that inasmuch as the terms of the new lease are entirely in the hands of Congress they could decide what they should be. The industrial plant is surely dependent on the power. We could not, as we see it now, make that amount of power cheaply anywhere else in that district—not as cheaply, anyway.

The CHAIRMAN. Well, if our dream is carried out and the entire Tennessee River is developed, as it ought to be if it can be, and we build reservoirs and convert all this power into primary power, and in addition some more power dams—

Mr. MAYO (interposing). Yes, sir.

The CHAIRMAN (continuing). There will be other sources of power besides these two dams on the Tennessee River that will in volume be greater than what will be developed on these two dams.

Senator NORBECK. But, Mr. Chairman, won't nearly all of them be Government-owned dams at that?

The CHAIRMAN. Well, so far the Government has not made any move except as to these dams.

Senator NORBECK. But, under the water-power bill, won't the Government acquire it anyway?

The CHAIRMAN. If the bill I have introduced becomes a law the Government will build some more dams there, but they may be built by private parties under the general water power act.

Senator NORBECK. And then they become Government property anyway, don't they?

The CHAIRMAN. The Government has a right to take them over at the end of the lease, 50 years. They are not owned by the Government, though, under that general dam act.

Mr. MAYO. Subject to recapture at the end of the lease.

The CHAIRMAN. At the end of the lease the Government has a right to buy them by paying for them under the terms that are laid down.

Mr. MAYO. And the condition of this contract is that the dams become Government property at the termination of the lease, without payment on the part of the Government.

The CHAIRMAN. Yes.

Mr. MAYO. Now, in regard to Senator McNary's objection, or seeming objection or supposition that we are going to get this plant at very low cost, providing we took over the Gorgas plant with the possibility of selling it at \$2,500,000, leaving a net investment of only \$2,500,000, as I stated yesterday, we have to continually keep the explosive end of this plant in order for emergency. It has been stated, I believe by Major Burns, that the maintenance and depreciation of this plant will amount to about two and a half millions a year. That is right?

Mr. WALDO. Five per cent on \$47,000,000.

Major BURNS. I don't recall making that statement myself. I may have done it. When we start in figuring what is the yearly expense of that plant, or what it is going to be, you are in a very doubtful realm. It is almost impossible to foresee what it is going to be. Right to-day we are keeping the plant for an approximate cost of \$100,000 a year. We don't know, though, what our real depreciation on machinery is. That is our out-of-pocket expense. In a few years a lot of that machinery may be so badly deteriorated that it will have to be replaced.

Mr. WALDO. That statement, major, had reference to a letter Mr. Fields had over in the House committee hearings referring to the depreciation on nitrate plant No. 2, taken at 5 per cent on an assumed normal peace-time valuation of \$47,000,000, amounting to \$2,350,000.

Major BURNS. We might have put in that answer as an effort to paint the picture. My own personal judgment is, though, that you can not charge up \$2,500,000 a year as depreciation and maintenance charges for that plant. I think that is entirely too high.

Mr. WALDO. Have you made any estimate of it?

Major BURNS. As I tell you, we are spending now approximately a hundred thousand dollars a year to keep the chemical plant going. We are also receiving from the use of our steam plant in excess of \$100,000 a year, probably \$200,000 a year, so that our charges for keeping the plant to-day, instead of being an expense, we are making a profit on the plant. As to what your real depreciation is and as to what portion of your plant will go out and have to be replaced at the end of 5, 10, 15, 20, or 30 years, I don't know, and it is nothing but a guess as to what it will be. If you take the reproduction value of the plant at \$47,000,000, assume that your depreciation is 5 per cent per year, you get the figures you mentioned.

The CHAIRMAN. But, as a matter of fact, right now, without using that plant, the Government keeping it in stand-by condition is making a profit out of it, as I understand it. It gets more for the lease of the steam power there than it costs to keep the other in stand-by condition.

Mr. MAYO. I think not, Mr. Chairman.

Major BURNS. That is correct.

Mr. MAYO. How do you assume that?

Major BURNS. We are spending down there to-day at No. 2 plant approximately a hundred thousand dollars a year. We have our steam plant leased on a fixed rental of \$10,000 per month, and we are going to get in addition to that 2 mills for each kilowatt hour that is generated. To start with, your fixed rental is more than your out-of-pocket expense, and then, over and above that, we are going to get a return for each kilowatt hour of energy that is delivered. That is all excluding, of course, this percentage of depreciation on your plant.

Mr. MAYO. That is the point. It is the largest item.

The CHAIRMAN. It is all right, Mr. Mayo, for you to give any figures you want here, or take any view of it you want to. You may be right and others wrong.

Mr. MAYO. I am trying to be fair by taking the figures of some others who have been intimately connected with the plant; but the facts are that the plant costs—what was it? Ninety million.

Mr. WALDO. Sixty-seven million.

The CHAIRMAN. You mean plant No. 2?

Mr. MAYO. Yes.

The CHAIRMAN. Sixty-seven million.

Mr. MAYO. Sixty-seven million.

The CHAIRMAN. Estimated to be worth forty-seven million, as I understand it.

Mr. MAYO. Take it at forty-seven million or, say, fifty million. Five per cent depreciation is a low depreciation rate on any manufacturing plant, particularly a chemical operation.

Major BURNS. Your judgment is much better than mine on an abstract question like that.

Mr. MAYO. Estimating the plant has '20 years' life, 5 per cent on fifty million would be two and a half million. But you can cut it in two—cut it in half—and call it a million and a quarter, if you please. I am merely trying to bring out what we have to keep in order and the possible expense, and also the fact that the plant in a hundred years will have to be rebuilt several times. So that it is without doubt a heavy liability.

Then I wish also to bring out the fact that the cyanamide process we consider a more or less obsolete process than other processes we have investigated. We can practically build an entirely new plant for five or six million dollars that would give us more capacity in ammonia. So the entire plant may soon be classed as a liability instead of an asset.

Mr. Ford in making up this offer was confronted with the fact that he was invited by the Government to make the offer, and he went down and inspected the plant and found that it was built for explosives during the war and for fertilizers during peace time.

(A short recess was here taken to enable the members to answer roll call.)

Mr. MAYO. As I started to say, Mr. Ford in framing up this offer tried to so make it that it covered all the original intentions of the Government to keep it in proper order as a national emergency protection; also to do what the Government had planned in having the plant there in peace times so as to make fertilizer at the lowest possible cost.

Senator HEFLIN. Mr. Mayo, you set out in your contract, I believe, that you are going to use about 100,000 horsepower in making fertilizer?

Mr. MAYO. That is what we figure it will take; yes, sir.

Senator HEFLIN. But I understand Mr. Ford really intends to use more than that.

Mr. MAYO. That is his intention; yes.

Senator HEFLIN. And he expects to manufacture fertilizer on a large scale?

Mr. MAYO. Yes, sir.

Senator HEFLIN. I just wanted to ask those few questions, Mr. Chairman.

Mr. MAYO. In addition to that his object was to so make his offer that it included the two dams which would improve the river navigation for a hundred miles and at the same time develop a large source of power, and to build a large industrial operation that would make the entire project a successful one.

The CHAIRMAN. His idea, as I understand you, is to establish manufacturing plants there of various kinds sufficient to utilize all the power that is not used in the Government's nitrate business?

Mr. MAYO. Yes, sir. His idea was that when he could approximately use all the power, then the question of building these storage reservoirs should be considered to increase the primary power of these dams and to increase the power up the river, which would also give large quantities of power to the different localities in which the storage dams were located. Personally I have been of the opinion that to carry out such a project Mr. Ford would have to spend approximately \$30,000,000 of his own money, and I am also of the opinion that it would be of a great deal more benefit to the country at large to put all of this power into a plant of this kind, the products of which are delivered to the whole country, than it would be to divide the power up into small lots around through transmission lines for local and domestic users—local industrial plants and domestic users. Take the Ford plants at Detroit. I am of the opinion that they do the country a great deal more good with the product they produce than if the same amount of power was distributed around that local section to small industrial plants and domestic users.

In addition to the apparatus at nitrate plant No. 2 for making fertilizer—of course, everybody understands the present apparatus only makes the nitrogen end of the product—Mr. Ford will have to install the necessary apparatus to make the phosphoric acid and potash elements of the fertilizer, so as to make a complete fertilizer. That also calls for a large investment.

The CHAIRMAN. Have you investigated on that point now, about the raw material?

Mr. MAYO. Yes, sir.

The CHAIRMAN. You can acquire it in unlimited quantities, you think, within a reasonable radius?

Mr. MAYO. Yes, sir.

The CHAIRMAN. What would you have to have, now?

Mr. MAYO. Well, the phosphoric-acid end of the business uses a large amount of phosphate rock.

The CHAIRMAN. Where would you get that?

Mr. MAYO. That is in the immediate vicinity; all the way from there to Florida.

The CHAIRMAN. Is there any other raw product that you would have to have?

Mr. MAYO. The nearest product for potash is in the Georgia shales. That is the raw material.

The CHAIRMAN. Would you be able to get the product out of that?

Mr. MAYO. Yes, sir. I am not sure that we can get all we want, but that would be one of the sources.

Senator HEFLIN. There are phosphate-rock beds, Mr. Chairman, just a few miles over in Tennessee.

The CHAIRMAN. Yes; I understand. I wanted to get it in the record. I knew about it.

Mr. MAYO. We estimate we can get all the phosphate rock we want by water transportation, delivered at the plant.

The CHAIRMAN. There is some doubt, is there not, about getting a supply of potash?

Mr. MAYO. Some; yes, sir.

The CHAIRMAN. In such condition that it is usable?

Mr. MAYO. Yes, sir.

The CHAIRMAN. It will probably be necessary, unless we discover new sources, to import that, would it not, or some of it?

Mr. MAYO. It might be.

The CHAIRMAN. Have you looked into it so as to be able to give the committee an idea whether you could import that from France or Germany cheaper than you could get it from the sources that you know of now in this country?

Mr. MAYO. It might be necessary to import some at the start, but we are of the opinion that we can make all we need in the near future.

The CHAIRMAN. You would not need any of that to make explosives, would you?

Mr. MAYO. No, sir.

The CHAIRMAN. That is only applicable to the fertilizer proposition?

Mr. MAYO. Yes, sir; now, to assist in making a cheap fertilizer, we have worked out a number of processes for the metal end of our business that more or less dovetail into the fertilizer business itself, to help reduce the cost of the fertilizer product, so that would be one way of reducing the fertilizer cost that perhaps Government operation would not have at all, if they confined themselves to the fertilizer business by itself. I can not see how the Government can start in making fertilizers themselves without perhaps making a complete fertilizer, and that would mean the addition of a large amount of apparatus that I referred to before for the phosphoric acid and the potash end of the business.

The CHAIRMAN. Yes; of course. If the Government or anybody else were going to make complete fertilizer, in addition to the nitrogen, they would have to have phosphoric acid.

Mr. MAYO. Mr. Waldo made a note that I would like to have him read.

Mr. WALDO. This has to do with the value of the plants.

The value of the plants is a combination of parts that can be usefully operated, and other parts that must be scrapped, and has been stated as \$16,000,000, according to the estimate of General Williams. The difference between this sum and the \$5,000,000 payable by Mr. Ford is \$11,000,000, which General Williams states in his testimony before the House committee is a very moderate sum to pay for national preparedness in nitrates.

The transaction, therefore, is not a sale of \$90,000,000 worth of property for \$5,000,000, but the act of taking over property worth perhaps \$16,000,000 under most favorable estimates, and securing national nitrate preparedness with that property at private expense. If this had been done prior to the war, a large sum (certainly \$30,000,000) would have been saved by the Government.

The CHAIRMAN. Now, Mr. Waldo, you assume there that this property of the Government is only worth \$16,000,000?

Mr. WALDO. Yes, sir.

The CHAIRMAN. That includes everything except the dams, does it?

Mr. WALDO. That is the nitrate plants; yes, sir—nitrate plants and accessories.

The CHAIRMAN. Am I right in saying that that includes everything except the dams?

Mr. WALDO. Yes, sir; I think you are.

Senator HEFLIN. Land and all?

The CHAIRMAN. Everything.

Mr. WALDO. That is the estimate.

The CHAIRMAN. That includes the Government's interest in the Gorgas plant, does it not?

Mr. WALDO. Yes, sir; the Gorgas plant has been included in that estimate at \$3,000,000.

The CHAIRMAN. Then, outside of the Gorgas plant all the other property that the Government owns there, outside of the dams, you value at \$13,000,000?

Mr. WALDO. It is not our valuation, Senator, that is General Williams's valuation.

The CHAIRMAN. What is your valuation?

Mr. WALDO. We are simply taking General Williams's statement.

The CHAIRMAN. I know that you are quoting him, and you might quote somebody that said it was not worth anything. But you represent Mr. Ford, and I want to know what his valuation is. What do you say it is?

Mr. MAYO. In reply to that I would say that it is hard to make a definite statement. As we see it, this fertilizer business, when you try to make highly concentrated fertilizers is a good deal in the same condition as the automobile business was 15 or 20 years ago. You have got to go step by step and tear down and rebuild, so it is pretty hard to say what that plant is worth for making fertilizers.

The CHAIRMAN. Yes; I admit that. I think it is a very difficult thing, and men of competent judgment will disagree, but you have put in the record Mr. Waldo's statement there.

Mr. MAYO. That was a statement by General Williams, and I thought it was proper to bring it out.

The CHAIRMAN. It is perfectly proper to put it in, but in connection with it I want to get your idea whether it is right or not.

Mr. MAYO. My reply would be it is very difficult to say.

The CHAIRMAN. Now, don't you believe it is worth more than that, Mr. Mayo?

Mr. MAYO. Well, I could not truthfully answer because, as I have stated earlier to-day, it may be that this entire nitrate end, except possibly the liquid-air plant, might be a total liability.

The CHAIRMAN. Yes; I know, and you might have an earthquake there to wipe it all out, but I would like to get your judgment now. You have one, and so has Mr. Ford. You have been investigating this property. Now, you have yourself put in the record as testimony the estimate of somebody else as to its value. Now, I want to get yours.

Mr. MAYO. The reason that prompted me to put General Williams's statement in was the question by Senator Norris yesterday trying to bring out the fact that we were—

The CHAIRMAN (interposing). I am not objecting to that. It is perfectly proper to put in anybody's estimate that you want to, but you are the fellows that are trying to lease or buy this property. Now, I want to know what you think it is worth.

Mr. MAYO. The best answer I could make is that it is worth what we offer for it.

The CHAIRMAN. Then you don't think it is worth as much as he does, do you?

Mr. MAYO. No, sir.

The CHAIRMAN. You think it is worth \$5,000,000?

Mr. MAYO. It all depends on what productive use it can be put to. When Mr. Ford made the offer we thought we had a fair idea. The more we investigate and get into the details the more mixed up we get on its value.

The CHAIRMAN. I know that, but still you are going into something that you proposed to pay \$5,000,000 for to begin with, and you say you are going to invest fifty million more, and you ought to be able to give the committee what you think this property is worth that you are buying from the Government. Mr. Ford has an idea of its worth, does he not? You would not buy something you did not have any idea what it was worth?

Mr. MAYO. No, sir; we would not buy something we did not have any idea as to what it was worth.

The CHAIRMAN. I don't expect you to bring it down to a dollar or a penny—

Mr. MAYO. Well, I couldn't if I wished to.

The CHAIRMAN (continuing). But give us your best estimate of what it is worth.

Mr. MAYO. I would say that Mr. Williams's estimate there is a very liberal one. That is as near as I could put it.

The CHAIRMAN. You agree with him, then, do you?

Mr. MAYO. The more we get into this subject the more convinced we are that everything down there is more obsolete and experimental than we thought it was at the start.

The CHAIRMAN. What is obsolete about this plant now? Is there anything obsolete about the steam plant? Is not that the latest thing?

Mr. MAYO. Yes, sir.

The CHAIRMAN. And the last word in all kinds of machinery that is in it?

Mr. MAYO. The steam plant is all right in every way, so far as I can see.

The CHAIRMAN. If you were going to build a cyanamid process plant to-day could you improve on this one in any respect, except you could build it cheaper, of course?

Mr. MAYO. I don't know enough about the cyanamid business to say; but the point is that we might not use the process at all.

The CHAIRMAN. I know you might not.

Mr. MAYO. Then what?

The CHAIRMAN. You expect to use it. There is not any doubt about that.

Mr. MAYO. I am not so sure, Senator. Really, I am not so sure.

The CHAIRMAN. What do you think this Waco quarry is worth out there?

Mr. MAYO. If we adopted some other process it would not be worth anything. We wouldn't use lime rock at all.

The CHAIRMAN. I know; but you are not answering my question, now, Mr. Mayo. You have an idea as to what that is worth. You say if such and such a thing would happen it would not be worth anything. If, for instance, this afternoon there should be an earthquake there and it should wipe us all out of existence it would not be worth anything. That is true; but we have got a railroad running up to it. You get that as part of it.

Mr. MAYO. Yes, sir.

The CHAIRMAN. You get a lot of engines and freight cars.

Mr. MAYO. Yes, sir.

The CHAIRMAN. What are they worth?

Mr. MAYO. Well, most of the transportation equipment there will be used in the construction work.

The CHAIRMAN. Yes; but you would have to buy it if you did not get it. You are getting this from the Government.

Mr. MAYO. Well, that is property of the Government.

The CHAIRMAN. But you get it under your bid.

Mr. MAYO. All your construction equipment that goes with the dams we do not get; no, sir.

The CHAIRMAN. You mean to say you won't use any of the Government's equipment there?

Mr. MAYO. All that construction equipment we would use in construction of the dams.

The CHAIRMAN. Exactly. But it is your property if your bid is accepted, is it not?

Mr. MAYO. No, sir. That is Government property. We use it to construct the dams with.

The CHAIRMAN. What becomes of it when the dams are constructed? This is a new idea.

Mr. MAYO. Whatever the salvage value on it is, it will be credited to the cost of the dams.

The CHAIRMAN. Do you expect to pay the Government anything for that equipment?

Mr. MAYO. No, sir.

The CHAIRMAN. Then are you not going to get it?

Mr. MAYO. No, sir.

The CHAIRMAN. What have you done with it when you are through with it?

Mr. MAYO. I say whatever salvage value there is in it will be credited to the dams.

The CHAIRMAN. You will sell it, then, and give the Government credit for what you get?

Mr. MAYO. Yes, sir.

The CHAIRMAN. The difference between its value now and its value then you get for nothing?

Mr. MAYO. No. It reduces the cost of the dams that much.

The CHAIRMAN. I know it does, but it saves you buying it.

Mr. MAYO. If there were no construction equipment there we would have to go out and buy it, and that would be charged up to the cost of the dams.

The CHAIRMAN. Do you know anybody else that has put a value on that property down there that has put it as low as you put it?

Mr. MAYO. I don't know that I do.

The CHAIRMAN. Do you know that it has been estimated that that is worth half what it cost and that the value has been considered as \$47,000,000?

Mr. MAYO. My judgment is that you might build it for half what it originally cost, but you could not say that was its value, unless you are taking it as a going concern and going on with the processes it was constructed for and you had a good market for the product.

Senator HEFLIN. Has anybody else made a bid anything like as good as the one you have made for it?

Mr. MAYO. We don't think so, Senator.

The CHAIRMAN. That would be a proper thing for these various bidders to consider. I think, to criticize the other bids. If you care to take up the bids that have been made and show the committee wherein you think they are not good, we would be glad to have you do it.

Mr. MAYO. We have no criticism of the other bids at all. We are willing to have our bid stand on its own bottom and take our own chances. I think probably when you hear Mr. Worthington he can give you a better idea about value than I can.

Senator HEFLIN. Right at this point, as I suggested yesterday, Mr. Mayo, the smaller the amount that you have to pay for this equipment down there to the Government the cheaper you can produce fertilizer, and the farmer will benefit by the fact that you do get this equipment at a low figure, will he not?

Mr. MAYO. Yes, sir.

The CHAIRMAN. If we go on that basis, then the committee ought to get you bidders into competition to see which would bid the least for it. Wouldn't that be true?

Mr. MAYO. Well, our competition is what we have offered. We have got nothing else to offer.

The CHAIRMAN. And it would be the duty of the committee to accept the bid that was the poorest?

Senator HEFLIN. I am undertaking to say, Mr. Chairman, that somebody will derive some benefit from the development of Muscle Shoals, and that Mr. Ford agrees to manufacture fertilizer and to charge only 8 per cent upon the cost of production; and if the outfit that he uses to make fertilizer costs a lower figure, he will be able to sell to the farmer at a lower figure, and therefore the farmer will benefit, and agriculture will be benefited by it.

Mr. MAYO. Mr. Ford thinks that if anybody makes a better offer than his, an offer which will do the country more good, they ought to have it, and we may get behind them and help them get it.

The CHAIRMAN. I think we all realize that we want to let everybody get the benefit of everything, whatever it may be. We don't know, any of us, just what he is going to be able to do nor exactly what the value of the properties we have there is.

Mr. MAYO. It is very hard to forecast the future, but Mr. Ford, as I said, has tried to cover the things that the plant was originally intended for, to provide explosives in time of war, to get the fertilizers just as cheap as possible,

to improve the navigation of the river, to get the power, and further, to industrialize that section so that it will be a successful venture.

Senator HEFLIN. Mr. Chairman, there is another proposition there. The estimate placed upon this property by the Chief of Ordnance was proceeding upon the theory that somebody would buy it outright and tear it down and do what they pleased with it, but the offer Mr. Ford is making is conditioned upon the proposition that he will keep it in good order and in readiness for use by the Government, and will turn it over to the Government for the purpose of making nitrates in time of war.

The CHAIRMAN. Of course, there are people—and the committee, as I understand it, of the House, even reported, after a visitation that they made—that the Government ought to quit, and we were unable to get any continuation of the work on that dam. They think we ought to scrap everything, let it all go, lose it all. So you can get any kind of opinion you want to. To my mind that would be one of the most foolish things—

Senator HEFLIN. It certainly would.

The CHAIRMAN. That ever entered the head of a legislator or business man or anybody that had the welfare of the country at heart. If we want to make fertilizer, if we want to utilize this power—even to sell—that property down there that the Government owns is worth a great deal more money, it seems to me; much more. Either one of these power plants, if they did nothing but act as a middle man, develop power and sell it, is worth more money than that.

Senator HEFLIN. But you have no assurance from anybody else that they will manufacture fertilizer there.

The CHAIRMAN. Of course, I don't want to discuss now the difference in these bids. The other bidders would not agree to that proposition, of course, especially Mr. Engstrum, who claims to have made a specialty of the fertilizer proposition in his bid.

Mr. MAYO. There seems to have been a very marked change in values down there since Mr. Ford made his offer.

The CHAIRMAN. Well, yes. The whole country is laid out in lots, is it not?

Mr. MAYO. Yes.

Senator HEFLIN. They all realize now that it is a very fine project.

The CHAIRMAN. They are all running for office on the strength of it. They expect that New York City will be a country village compared to Muscle Shoals.

Mr. MAYO. I don't know that we have anything else to offer, Senator.

The CHAIRMAN. All right, Mr. Mayo. We are very much obliged to you.

Senator HEFLIN. Before Mr. Ford went down there and made this offer that whole country looked like a cemetery around there, didn't it?

Mr. MAYO. On my first visit it looked akin to it; yes, sir.

The CHAIRMAN. When was that?

Mr. MAYO. That was some time last June, if I remember correctly.

The CHAIRMAN. You did not see any tombstones down there, did you? A cemetery usually has them.

Senator HEFLIN. The situation was a very dull one in a business way. It was practically dead.

The CHAIRMAN. It is very dull right now.

Mr. MAYO. It approached a graveyard.

The CHAIRMAN. I don't want to belittle you for your offer. I think you did a great thing for your country, even if you do not get this proposition, by making that bid. Your bid started everybody else to thinking and investigating.

Mr. MAYO. Yes, sir.

The CHAIRMAN. You made the first bid and first investigation, and I think it was a great thing myself.

Mr. MAYO. I beg to thank you, Senator, for recognizing Mr. Ford's effort to bring this great national project to life.

(Mr. Mayo submitted the following amended proposal, which is here printed in full, as follows:)

COPY OF FINAL LEGALLY SIGNED PROPOSAL OF JANUARY 25 NOW IN THE HANDS OF CONGRESS.

PROPOSAL OF HENRY FORD FOR THE COMPLETION AND LEASING OF THE DAMS AND THE HYDROELECTRIC POWER PLANTS AT MUSCLE SHOALS AND FOR THE PURCHASE OF NITRATE PLANT NO. 1, NITRATE PLANT NO. 2, THE WACO QUARRY, AND THE GORGAS WARRIOR RIVER STEAM PLANT, ALL IN THE STATE OF ALABAMA.

Whereas the United States, through the Chief of Engineers, United States Army, invited the undersigned to submit an offer for the power to be developed at the Muscle Shoals Willson Dam (hereinafter referred to as Dam No. 2); and

Whereas the undersigned did, under date of July 8, 1921, submit to the Chief of Engineers, an offer for the consideration of the President, the Secretary of War, and Congress, which offer proposed a lease based upon the completion of Dam No. 2, and the construction of Dam No. 3 (as designated by the United States Engineers in H. R. Doc. 1262, 64th Cong., 1st sess., and hereinafter referred to as Dam No. 3) and of their power houses, by the United States, and the payment by the undersigned of a fixed annual rental therefor, and proposed to purchase Nitrate Plant No. 1 at Sheffield, Ala., Nitrate Plant No. 2 at Muscle Shoals, Ala., Waco Quarry, near Russellville, Ala., and the Warrior Steam Plant at Gorgas, Ala., and all transmission lines connected with said plants; and

Whereas the undersigned, at the invitation of the Secretary of War, did, on January 11, 1922, submit a modification of his former proposal, based upon the construction and completion by a company to be formed by him, of all the work referred to in the offer of July 8, 1921, aforesaid, the actual cost of said work to be borne by the United States, and agreed on behalf of said company to pay 4 per cent of the total actual cost of completing said plants, structures, works, and improvements as annual rental for the lease thereof;

Now, therefore, in lieu of said offer of July 8, 1921, and in accordance with said modification of January 11, 1922, the undersigned hereby submits to the Secretary of War, and through him for appropriate action by the President and Congress, the following offer, which shall become a binding agreement upon approval of same by Congress:

1. For the purpose of carrying out the terms of this agreement, the undersigned will form a corporation (hereinafter referred to as the company), with a paid capital stock of not less than \$10,000,000, to be controlled by the undersigned, which company will immediately enter into and execute all necessary or appropriate instruments of contract to effectuate this agreement.

2. The company shall complete for the United States the construction work on Dam No. 2, its locks, power house, and all necessary equipment, all in accordance with the plans and specifications prepared, or to be prepared or approved by the Chief of Engineers, United States Army, and progressively install the hydroelectric equipment in said power house adequate for generating approximately 600,000 horsepower, all the work aforesaid to be performed as speedily as possible at actual cost and without profit to the company, it being understood that the necessary lands and flowage rights, including lands for railway and terminal connections, have been or will be acquired by the United States.

3. The company will lease from the United States Dam No. 2, its power house, and all of its hydroelectric and operating appurtenances, except the locks, together with all lands and buildings owned or to be acquired by the United States connected with or adjacent to either end of the said dam, for a period of 100 years from the date when structures and equipment of a capacity of 100,000 horsepower are constructed and installed and ready for service, and will pay to the United States as annual rental therefor 4 per cent of the actual cost of acquiring lands and flowage rights, and of completing the locks, dam, and power house facilities (but not including expenditures and obligations incurred prior to approval of this proposal by Congress), payable annually at the end of each lease year, except that during and for the first six years of the lease period the rentals shall be in the following amounts and payable at the following times, to wit: Two hundred thousand dollars one year from the date when 100,000 horsepower is installed and ready for service, and thereafter \$200,000 annually at the end of each year for five years.

4. The company will further pay to the United States during the period of the lease of Dam No. 2 \$35,000 annually, in installments quarterly in advance, for repairs, maintenance, and operation of Dam No. 2, its gates and locks; it being understood that all necessary repairs, maintenance, and operation thereof shall be under the direction, care, and responsibility of the United States during the said 100 year lease period; and the company, at its own expense, will make all necessary renewals and repairs incident to efficient maintenance of the power house, substructures, superstructures, machinery, and appliances appurtenant to said power house, and will maintain the same in efficient operating condition.

5. At all times during the period of the lease of Dam No. 2 the company will furnish to the United States, free of charge, to be delivered at any point on the lock grounds designated by the Chief of Engineers, United States Army,

electric power to an amount necessary for the operation of the locks, but not in excess of 200 horsepower.

6. As soon as the release of suitable construction equipment and labor forces at Dam No. 2 will permit, or at an earlier date if desired by the company, the company shall construct and complete for the United States Dam No. 3, its lock, power house, and all necessary equipment, all in accordance with plans and specifications prepared and to be prepared by the Chief of Engineers, United States Army, or by the company, at its option, and approved by the Chief of Engineers, United States Army, and progressively install the hydroelectric equipment in said power house adequate for generating approximately two hundred and fifty thousand (250,000) horsepower, all the work aforesaid to be performed as speedily as possible at actual cost and without profit to the company, it being understood that the necessary lands, flowage rights, and rights of way shall be acquired by the United States, through an agent to be named by the company.

7. The company will lease from the United States Dam No. 3, its power house, and all of its hydroelectric and operating appurtenances, except the lock, together with all lands and buildings owned or to be acquired by the United States connected with or adjacent to either end of the said dam, for a period of 100 years from the date when structures and equipment of a capacity of 80,000 horsepower are constructed and installed and ready for service, and will pay to the United States, as annual rental therefor, 4 per cent of the actual cost of acquiring lands and flowage rights, and of constructing the lock, dam, and power house facilities, payable annually at the end of each lease year, except that during and for the first three years of the lease period the rentals shall be in the following amounts and payable at the following times, to wit: One hundred sixty thousand dollars one year from the date when 80,000 horsepower is installed and ready for service, and thereafter \$160,000 annually at the end of each year for two years.

8. The company will further pay to the United States during the period of the lease of Dam No. 3 \$20,000 annually, in installments, quarterly in advance, for repairs, maintenance, and operation of Dam No. 3, its gates and lock; it being understood that all necessary repairs, maintenance, and operation thereof shall be under the direction, care, and responsibility of the United States during the said 100-year period; and the company, at its own expense, will make all necessary renewals and repairs incident to the efficient maintenance of the power house, substructures, superstructures, machinery, and appliances appurtenant to said power house, and will maintain the same in efficient operating condition.

9. At all times during the period of the lease of Dam No. 3, the company will furnish to the United States, free of charge, to be delivered at any point on the lock grounds designated by the Chief of Engineers, United States Army, electric power necessary for the operation of the said lock, but not in excess of 100 horsepower.

10. For the purpose of enabling the Government to create and provide a sinking fund to retire the cost of Dam No. 3 at the end of 100 years the company will, at the beginning of the fourth year of the lease period, and semiannually thereafter for the remaining term of the lease, pay to the United States Government the sum of \$3,505; and for the purpose of enabling the Government to create and provide a sinking fund to retire the cost of Dam No. 2 at the end of 100 years, the company will at the beginning of the seventh year of the lease period, and semiannually thereafter for the remaining term of the lease, pay to the United States Government the sum of \$19,868.

11. The company agrees to purchase from the United States and the United States will sell the following properties, namely:

(a) All of the property constituting nitrate plant No. 2 (as officially known and designated), including lands, power plants, buildings, material, machinery, fixtures, equipment, apparatus, appurtenances, tools, and supplies, and the right, license, and privilege to use any and all of the patents, processes, methods, and designs which have been acquired and may be transferred or assigned to a purchaser of nitrate plant No. 2 by the United States, together with the sulphuric acid units now in storage on the premises.

(b) All of the property constituting nitrate plant No. 1 (as officially known and designated), including lands, power plants, buildings, material, machinery, fixtures, equipment, apparatus, appurtenances, tools, and supplies, and the right, license, and privilege to use any and all of the patents, processes, methods, and designs which have been acquired and may be transferred to a purchaser

of nitrate plant No. 1 by the United States, but the company shall not be obligated to operate nitrate plant No. 1 as an air nitrogen fixation plant.

(c) All of the property constituting the Waco Quarry (as officially known and designated), including right of way and buildings, material, quarry, tracks, machinery, railroad tracks, appurtenances, tools, and supplies.

(d) All of the property constituting the steam power plant, now owned by the Government at Gorgas, Ala., on the Warrior River, including lands, rights of way, buildings, machinery, material, fixtures, apparatus, appurtenances, tools, and supplies, and the transmission line from the Gorgas steam plant to nitrate plant No. 2 at Muscle Shoals, and all other transmission lines belonging to the United States and connected with any of the aforesaid Government properties.

12. The company agrees to accept and the United States to assign and transfer to the company all rights, title, interest, powers, and benefits belonging to or that may accrue to the United States or its legal agents as a party to its contract dated December 1, 1917, with the Alabama Power Co. in connection with said Gorgas plant and transmission line, and the company will assume all obligations and liabilities lawfully imposed upon the United States by said contract; but nothing in this paragraph shall be held to affect any question of the validity of any provision of said contract.

13. As the purchase price for the foregoing plants and properties to be conveyed to the company by the United States the company will pay to the United States \$5,000,000 in five installments as follows: One million dollars upon the acceptance of this offer, and \$1,000,000 annually thereafter until the purchase price is fully paid, with interest at the rate of 5 per cent per annum on deferred payments, with the privilege of anticipating any or all such payments, possession to be delivered upon payment of the first of said installments, and deeds of conveyance to be delivered when full payment for said property has been made.

14. This proposal contemplates and it is agreed that the purchase price for the property aforesaid shall not be diminished by reason of depreciation due to use or wear of buildings, machinery, and equipment or to the action of the elements; nor shall any claim be made for losses in or diminution of quantity of tools and supplies due to upkeep and maintenance during the period between the date hereof and the date of delivery of possession of said property, it being further understood that no inventory of the property need be taken, but that due care will be exercised by the United States in preserving and safeguarding the aforesaid real and personal property intact until possession thereof passes to the company. If any part or parts of the aforesaid plants necessary for proper operation of same have been removed by the United States, said part or parts shall be returned when possession of said plants passes to the company. Deeds of conveyance of real property shall warrant the title to be good and unencumbered.

15. The company agrees to operate nitrate plant No. 2, using the most economical source of power, at the approximate present annual capacity of its machinery and equipment, in the production of nitrogen and other commercial fertilizers (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control, and further agrees:

(a) To determine by research whether by means of electric furnace methods and industrial chemistry there may be produced on a commercial scale fertilizer compounds of higher grade and at lower prices than fertilizer-using farmers have in the past been able to obtain, and to determine whether in a broad way the application of electricity and industrial chemistry may accomplish for the agricultural industry of the country what they have economically accomplished for other industries, and if so found and determined, to reasonably employ such improved methods.

(b) To maintain nitrate plant No. 2 in its present state of readiness or its equivalent, for immediate operation, in the manufacture of materials necessary in time of war for the production of explosives.

16. In order that the farmers may be supplied with fertilizers at fair prices and without excessive profits, the company agrees that the maximum net profit which it shall make in the manufacture and sale of fertilizer products shall not exceed 8 per cent of the fair actual annual cost of production thereof. In order that this provision may be carried out the company agrees to the creation of a board of not more than nine voting members, chosen as follows: The three leading representative farm organizations, national in fact, namely, the American Farm Bureau Federation, the National Grange, the Farmers' Educational and Cooperative Union of America, or their successors, shall each designate

not more than seven candidates for said board. The President shall nominate for membership on this board not more than seven of these candidates, selected to give representation to each of the above-mentioned organizations, said nominations to be made subject to confirmation by the Senate, and there shall be two voting members of said board selected by the company. A representative of the Bureau of Markets, Department of Agriculture, or its legal successor, to be appointed by the President, shall also be a member of the board, serving in an advisory capacity without the right to vote. The said board shall determine what has been the cost of manufacture and sale of fertilizer products and the price which has been charged therefor, and, if necessary for the purpose of limiting the annual profit to 8 per cent as aforesaid, shall regulate the price at which said fertilizer may be sold by the company. For these purposes, said board shall have access to the books and records of the company at any reasonable time. In order that such fertilizer products may be fairly distributed and economically purchased by farmers, the said board shall determine the equitable territorial distribution of the same and may in its discretion make reasonable regulation for the sale of all or a portion of such products by the company to farmers, their agencies, or organizations. If and when said board can not agree upon its findings and determination, then the points of disagreement shall be referred to the Federal Trade Commission (or its legal successor) for arbitration and settlement, and the decision of said commission in such cases shall be final and binding upon the board.

17. Whenever, in the national defense, the United States shall require all or any part of the operating facilities at nitrate plant No. 2, for the production of materials necessary in the manufacture of explosives or other war materials, then the United States shall have the immediate right, upon five days' notice to the company, to take over and operate the same, and the company will supply the United States with hydroelectric power necessary for such operations, together with the use of all patented processes which the United States may need which the company owns or has the right to use. When required for national defense any of the company's personnel and operating organization necessary for operating any part of nitrate plant No. 2 in the manufacture of materials for explosives, or other war materials, shall be at the disposal of the United States. For the facilities and services aforesaid the United States shall protect the company from losses occasioned by such use and shall return the said property in as good condition as when received and reasonably compensate the company for the use thereof. All duly authorized agents and representatives of the United States shall have free access at all reasonable times to inspect and study all of the operations, chemical processes and methods employed by the company at nitrate plant No. 2, providing that such agents and representatives shall not use the information and the facts concerning any of the company's operations, except for the benefit and protection of the United States.

18. In order that said company may be supplied with electric power and the farmers with fertilizers after the termination of the said one-hundred-year leases, should the United States elect not to operate said power plants but determine to lease or dispose of same, the company shall have the preferred right to negotiate with the United States for such lease or purchase and upon such terms as may then be prescribed by Congress.

19. As a method of procedure in the event of the violation of any of the terms of this proposal or any contracts made in furtherance of its terms, the company agrees that the Attorney General may, upon the request of the Secretary of War, institute proceedings in equity in the District Court of the United States for the Northern District of Alabama for the purpose of canceling and terminating the lease of Dam No. 2 or Dam No. 3, or both of them, because of such violation or for the purpose of remedying or correcting by injunction, mandamus, or other process any act of commission or omission in violation of the terms of this proposal or any contract made in furtherance thereof.

20. The above proposals are submitted for acceptance as a whole and not in part. Upon acceptance the promises, undertakings, and obligations shall be binding upon the United States and jointly and severally upon the undersigned, his heirs, representatives, and assigns and the company, its successors and assigns; and all the necessary contracts, leases, deeds, and other instruments necessary or appropriate to effectuate the purposes of this proposal shall be duly executed and delivered by the respective parties above mentioned.

Approved and signed by me at Dearborn, Mich., this 25th day of January, 1922.

HENRY FORD.

MUSCLE SHOALS.

THURSDAY, MAY 4, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in the Commerce Committee room, Capitol, Senator George W. Norris presiding.

Present: Senators Norris (chairman), McNary, Norbeck, Harreld, Harrison, and Heflin.

STATEMENT OF MR. J. W. WORTHINGTON, CHAIRMAN EXECUTIVE COMMITTEE TENNESSEE RIVER IMPROVEMENT ASSOCIATION.

The CHAIRMAN. Give you full name, business, etc., to the reporter, Mr. Worthington.

Mr. WORTHINGTON. J. W. Worthington, chairman executive committee Tennessee River Improvement Association.

The CHAIRMAN. What is your occupation, Mr. Worthington?

Mr. WORTHINGTON. Well, I am not engaged in any business at all now, Mr. Chairman.

The CHAIRMAN. Are you not an engineer?

Mr. WORTHINGTON. I am an engineer by education, and have followed that profession in its various lines.

The CHAIRMAN. You are one of Mr. Ford's representatives here, are you?

Mr. WORTHINGTON. I represent Mr. Ford only to the extent that, having presented the Muscle Shoals project to him, I agreed that I would support before the Secretary of War and before committees of Congress, if it became necessary, the same facts that I presented to him, and that I would undertake to make as clear as possible that his proposal presented a new viewpoint with regard to joint navigation and power development.

The CHAIRMAN. You are here, as I understand it, advocating the acceptance of the offer made by Mr. Ford?

Mr. WORTHINGTON. I would rather say, if you are willing to let me put it that way, that I am defending the facts and that I support his offer.

The CHAIRMAN. I am not trying to put it at all.

Mr. WORTHINGTON. That is a fact, that I am here to defend and support the facts that were presented to Mr. Ford, that caused him to sign the offer. I will go further and say that I advocate its acceptance.

The CHAIRMAN. Are you in the employ of Mr. Ford now?

Mr. WORTHINGTON. No, no; not with respect to being in his pay. Oh, no.

The CHAIRMAN. That is what I wanted to get at.

Mr. WORTHINGTON. Oh, no.

The CHAIRMAN. And you have not been?

Mr. WORTHINGTON. I have never been.

The CHAIRMAN. You have traveled around the country somewhat advocating the thing in public speeches, have you not?

Mr. WORTHINGTON. No; I never have in public speeches.

The CHAIRMAN. Haven't you?

Mr. WORTHINGTON. No; never. The only thing that I ever have done, Mr. Chairman, is to present the engineering and economic facts as I felt they were justified in being presented.

The CHAIRMAN. Well, did you not make a speech down here?

Mr. WORTHINGTON. With that single exception, but I did not go there advocating anybody's proposal. I merely went there to present some facts in response to an invitation to address that organization.

The CHAIRMAN. I was there, and I heard you, Mr. Worthington, and I had the idea that you were advocating Mr. Ford's proposal.

Mr. WORTHINGTON. No; those people asked me to address them, Mr. Chairman, and I broke my rule and I am very sorry for it.

The CHAIRMAN. I am not criticizing that course, but I want to get the truth in the record. You have a perfect right, of course, to advocate Mr. Ford's proposition anywhere and under any circumstances you please.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. But, hearing you make that speech there, I had no other idea than that you were employed by Mr. Ford.

Mr. WORTHINGTON. Oh, no.

The CHAIRMAN. You were one of his engineers?

Mr. WORTHINGTON. No; not in the sense of being in his employ for pay at all; but, as I have just stated to you, having made the representations I did to Mr. Ford which caused him to make his offer of July 8, very naturally I would like to see its acceptance.

The CHAIRMAN. What interest, if any, have you in this? Are you interested in any real estate there?

Mr. WORTHINGTON. Not at all.

The CHAIRMAN. You do not have any interest in any of these various properties?

Mr. WORTHINGTON. No.

The CHAIRMAN. That are being offered on the market now?

Mr. WORTHINGTON. Not a dollar of property.

The CHAIRMAN. I understand that there is some organization in the city of New York that is advocating the sale of it. You have no interest in that?

Mr. WORTHINGTON. Oh, no. I do not know who they are, and I do not know that that was true.

The CHAIRMAN. Yes; I heard some one in this hearing say that he was in New York and saw a sign there—

Mr. WORTHINGTON. Mr. Chairman, I would like to make the statement here that I have not a dollar's interest in it, and I do not own anything in the world personally that it will have the slightest effect upon.

The CHAIRMAN. That is what I wanted to get into the record, Mr. Worthington.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. That all bears upon your testimony.

Mr. WORTHINGTON. Yes.

Senator HEFLIN. Mr. Chairman, may I ask you what sign that was?

The CHAIRMAN. I do not know; I did not see it, but there was a sign there on somebody's office in New York City, saying, "Muscle Shoals property for sale," or something of that kind. I have heard that that was true.

Mr. WORTHINGTON. Mr. Ford made the same inquiry, and naturally, that you are making.

The CHAIRMAN. Yes. Well, you have nothing to gain or lose by the acceptance of this offer?

Mr. WORTHINGTON. Nothing at all.

The CHAIRMAN. What is your business now, Mr. Worthington?

Mr. WORTHINGTON. I have not any.

The CHAIRMAN. You are not following your profession?

Mr. WORTHINGTON. Not at all.

The CHAIRMAN. And you have not been?

Mr. WORTHINGTON. Except in so far as relates to this Muscle Shoals project.

The CHAIRMAN. How much of an examination have you made of the Muscle Shoals proposition? Have you gone into it professionally and have you made a close examination of the facts?

Mr. WORTHINGTON. Well, I have been studying it and following it, sometimes I have thought, very foolishly, for the last 15 years.

The CHAIRMAN. That was without being employed by anybody?

Mr. WORTHINGTON. Yes.

The CHAIRMAN. And just because you are interested in the development?

Mr. WORTHINGTON. Because I think that is one of the most unusual opportunities ever furnished to capital.

The CHAIRMAN. Now, with that preliminary statement, Mr. Worthington, go on in your own way and tell us anything you want to about this matter.

Mr. WORTHINGTON. Well, I think the best way that I can approach it would be from the standpoint of transportation and agriculture.

Electricity has been the chief factor which has made most of the changes in our industrial and social life in this country in the last 25 or 30 years, but electricity has not been applied in any way to the farm, nor have we progressed in this country or have gone forward even as fast as smaller countries in Europe in the electrification of railways, so that this Muscle Shoals project furnishes an opportunity of seeing how we can improve the navigation of a stream and power jointly developed may be applied to agriculture and also to transportation.

Take Mr. Ford's proposition and contrast it, Mr. Chairman, with the Government's policy of improving rivers. The rivers and harbors appropriation from June 30, 1896, to June 30, 1920, amounted to \$703,053,456.35. None of those appropriations returned either interest or any of the principal, and you might take the Ohio, just as an illustration, where the appropriations for the main stream and the tributaries, for maintenance and operation, amounted to a sum in excess of \$142,000,000, without a dollar of return on the investment.

Now, contrast that with a tributary to the Ohio, the Tennessee, and take Mr. Ford's offer, in which he proposes to pay 4 per cent upon the appropriation and establish a retirement fund that will return to the United States its investment. Take Dam No. 3 as an example, and you have the cost of the improvement of navigation free. Not only is that true, but a more important thing, in a way, is true—that you create power at the same time, which, in its distribution, goes to the solution of our troubles and problems of transportation.

So it does seem that if such a policy as he proposes could be adopted and it could be applied to other rivers in the country, where joint navigation improvement and power development can be made, it would be one of the most highly economic and interesting propositions ever made.

Take your Panama Canal, and suppose that could have been placed on the same footing. The Panama Canal cost \$380,554,949. The gross income of all kinds in the year 1920-21 was \$12,040,117. The operating expenses were \$9,328,300. Interest at 3 per cent on the net investment was \$11,416,648. If the investment of the Government in the canal had been required to pay 3 per cent interest on the total, there would have been a shortage or a deficit, you might say, of \$20,410,769. That is, if you should require the Panama Canal to meet the terms of Mr. Ford's proposal the Panama Canal would have gone into the hands of a receiver.

Take reclamation projects established some 20 years ago. The net investment on June 30, 1921, was \$125,870,830. The gross income required to meet the terms of the Ford offer would have been \$10,179,932. The actual gross income for the fiscal year ending June 30, 1921, was only \$4,191,684, a shortage, if it had been subject to the same terms and conditions as the Ford offer, of \$5,988,248.

The CHAIRMAN. It would have been a much larger shortage if you had taken a year further back, away at the beginning.

Mr. WORTHINGTON. Yes, sir.

The CHAIRMAN. When they had no income?

Mr. WORTHINGTON. The point that I would like to expressly direct your attention to is this, that if it is a sound governmental policy to make appropriations for these reclamation projects and not charge any interest, but slowly get the return of the principal invested by the Government, will it not be a perfectly sound and economic thing to do to accept Mr. Ford's offer, who proposes to pay 4 per cent on your money and return it to you; and, especially, is it not a parallel case, or can not be denied that what is proposed at Muscle Shoals with respect to agriculture and farm production is on all fours with the Roosevelt Dam?

The CHAIRMAN. Well, do you think it is on all fours with the reclamation projects?

Mr. WORTHINGTON. Oh, I most undoubtedly do.

The CHAIRMAN. If you would try to finance the reclamation projects on the same theory, with a view of getting back the money—in other words, charging interest—you would fail.

Mr. WORTHINGTON. Exactly.

The CHAIRMAN. You would be bound to fail.

Mr. WORTHINGTON. And, therefore, I would like to suggest that if you grant that it would fail, then how much more forced are you to accept the Ford offer, which will not fail?

The CHAIRMAN. Mr. Worthington, I have been all over some of those reclamation projects, and I remember one in particular where the Government's project carried its canal around above a private corporation. They had the choice; they were in there first; they had the bottom land to irrigate. The Government took

the rougher land above that, and I stood above that dam near where they began to converge, where they came out of the river, although they came out quite a number of miles apart, where I could see them both. Now, with all of its advantages, this privately owned ditch was a failure. The farmers were not able to pay the interest and meet the payments. Just above them, where they did not have quite as nice land to irrigate under the Government ditch, they were a success and were doing fine. The Government's proposition was successful. The privately owned corporation—a corporation that everybody praises to the skies and which everybody says is much more efficient than Government operation—was a failure.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. And they lost a whole lot of their money there. These men invested their money there, and they did it in good faith; they were doing the best they could, and the only difference between the two propositions was that one bore interest and the other one did not. There was success on the one hand, and there was a failure on the other hand. There was success to the Government's enterprise and failure to the privately owned enterprise.

Mr. WORTHINGTON. That is quite true; but I hope I get my point before you, that if you can make appropriations for reclamation projects which do not pay any interest, that, at least, presents the Ford offer very attractively.

The CHAIRMAN. Probably.

Mr. WORTHINGTON. Since it does pay for it.

The CHAIRMAN. But I do not really see its application in comparison with a reclamation proposition. I think it is so entirely different.

Mr. WORTHINGTON. Well, might I put this thought before you in support of my contention that they are parallel, that if it's a sound policy to make the appropriations that you have, aggregating since the beginning 175,000,000, and you have—

The CHAIRMAN (interposing). Yes; more than that; is it not?

Mr. WORTHINGTON. Not much more than that.

The CHAIRMAN. I was under the impression that it was more than that.

Mr. WORTHINGTON. It is about a net of \$125,000,000. The difference has been paid back to you. It is just as desirable; it is just as necessary to renew the fertility of the soil of these lands that have been made nonfertile by long use, and make them fertile again, as it is to take water and distribute it out over the arid lands that will not grow crops without the water.

The CHAIRMAN. I will agree with you on that.

Mr. WORTHINGTON. That is one point that I want to make.

The CHAIRMAN. I think it is a national problem.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. That after all is said and done it is not really for the benefit of the farmers but for the benefit of all others.

Mr. WORTHINGTON. Perhaps so.

The CHAIRMAN. Because the benefit to the farmer is bound to redound to our benefit in the cost of living.

Mr. WORTHINGTON. Absolutely, sir.

Now, before leaving the question of navigation improvement I would like to impress upon the committee that there never has been proposed before any plan under which the cost of navigation improvement could be paid back into the Treasury by power users or users of products produced by power.

The CHAIRMAN. Well, somebody has to pay it; it is paid back. On the other hand, if the Government did it and owned it itself and never got it back, the benefit would reach the people in the same way in the reduced prices that they would pay for fertilizer.

Mr. WORTHINGTON. Well, you enter upon a phase of the case that I would naturally have to let go by, because as to whether Muscle Shoals ought to be developed and operated by the United States Government or whether it is better to accept Mr. Ford's offer is a matter for your committee and Congress to decide and an expression of my personal opinion would not change the case at all; but I do not mind saying very frankly that I think the people of this country—the taxpayers and the consumers of the products that may be purchased there—would fare better under the Ford plan than under any Government-operated plan. That is a matter of opinion, however. One thing we could agree about is that somebody ought to do it, couldn't we?

The CHAIRMAN. I think so. I think we are all agreed on that.

Mr. WORTHINGTON. I would like to stress one point a little further—that power development at a dam that gives splendid slack-water navigation at the

same time is so desirable and so economic that it does seem that the Ford offer, whether accepted or not, suggested the policy that might be adopted generally by the Government, if you do not want private enterprise to do it.

Take the Tennessee River as an example, and the Government operation, together with its history of navigation improvement; and while I do not pretend to contend with you, Mr. Chairman, that the Government methods will not be changed—they may be—however, it is a fact that the Government of the United States started the navigation improvement of the Tennessee River in the year 1828, and it is easily conceivable—indeed, Mr. Ford has stated that he felt that a river ought to be taken up as a whole and completed in its entirety, and that the water resources of a river ought to be made available to navigation of the stream, for the furnishing of cheaper power than coal will furnish, and then, perhaps, electrify our railroads and get cheaper freight rates.

On that score, Mr. Chairman, I think this Muscle Shoals case furnishes the opportunity to do just exactly what Mr. Ford says he would like to do—namely, make it a great example.

Take the Chicago, Milwaukee & St. Paul Railway, operating a total of 646 miles of main line, electrical divisions, and 860 miles with sidetracks included. The estimate is—and it is over the signature of the president of the Chicago, Milwaukee & St. Paul Railway—that electric operations save annually about 260,000 tons of coal and about 32,000,000 gallons of oil. The saving in avoiding the use of this fuel is not only in the value of the fuel itself, but it eliminates the hauling of nonrevenue traffic for fuel amounting to nearly one-third, Mr. Chairman, of the total coal hauled by the railroads.

The 44 electric locomotives have replaced 120 steam locomotives, and it would have required 210 cars moving continuously to handle the coal for these steam locomotives on one division alone.

Now, at this point, please, I would like to stress this point. It was not a necessity to electrify the Chicago, Milwaukee & St. Paul Railway. The road was electrified because of the availability of water power. The electrification of the Chicago, Milwaukee & St. Paul Railway has reflected a reduction of 22.5 per cent in the number of trains and has cut down the time of the trains 24.5 per cent. It has so improved operating conditions that 30 per cent more tonnage can be handled in 80 per cent of the time, and this means an increase of at least 50 per cent in the capacity of its trains, and probably more.

The CHAIRMAN. It will be interesting there, if it will not interfere with your outline, to tell us as you go along what that power costs. Do you have that?

Mr. WORTHINGTON. Three mills. We will insert it at three mills per kilowatt hour, with the reservation that we may check that up.

The CHAIRMAN. Yes. That is not as cheap power as we are going to get at Muscle Shoals, if we are not disappointed as to what happens; if our dream, as you may call it, comes true of developing that power and getting everything out of it.

Mr. WORTHINGTON. Yes; if you work out the entire river.

The CHAIRMAN. As we ought to do.

Mr. WORTHINGTON. Yes; as you ought to do.

The CHAIRMAN. Yes.

Mr. WORTHINGTON. And you can not embrace the real economies until you do it.

The CHAIRMAN. No; you can not tell what they are going to be, but some of us have been dreaming about that hope it will be a cheaper power than the Milwaukee road gets.

Mr. WORTHINGTON. I think so; yes. The electrification of railways doubles the capacity of trackage and postpones for a long term of years the time when double tracking will be necessary.

Now, all such phraseology as I have just pronounced amounts to nothing unless there is something practicable about it, but already the president of the Louisville & Nashville Railroad says that if Mr. Ford develops this power and will let the road have the power, he would proceed to electrify at least one division.

The CHAIRMAN. Now, you have struck a point that has a very important bearing on Mr. Ford's proposition.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. The Louisville & Nashville Railroad will electrify if Mr. Ford will let them have it. Now, should the Government place this great development on this river and all of that wonderful power in the hands of one man and let him say where it should be used and who should have it?

Mr. WORTHINGTON. In answering that I can only give you my personal view, and yet I repeat that I doubt whether that would amount to anything if I did, but I answer yes, and I further suggest, since you bring up the question, that the people of this country would approve of it.

The CHAIRMAN. And the next river we develop we will give to some other man, some other big millionaire.

Mr. WORTHINGTON. I am going to ask you to let me differ with you there.

The CHAIRMAN. Oh, you would only give it to Mr. Ford, then?

Mr. WORTHINGTON. I am going to, because his purposes are very well known. What inspires Mr. Ford, what Mr. Ford desires this power for, is the thing, and if he gets the power, and in the course of time sins against public interest, you will have an example that will guide you in legislation to protect the country in the future.

Senator McNARY. May I ask you at this point what are those desires other than those expressed in his proposal?

Mr. WORTHINGTON. Oh, I feel, in answer to your question, Senator, that what is expressed in the proposal itself is a reply to your question, because I do not think it has ever happened where a great industrial figure in this country became involved in a proposal to enter into a field of possibilities, to take the risk and say to the Government, "If you will join me in this I will let your own governmental agencies look in and see just exactly what I am doing in respect to fertilizer, and control, and, in fact, regulate the prices." As to his purpose, I can not commit Mr. Ford. I would not think of doing so.

Senator McNARY. Well, you elected—

Mr. WORTHINGTON. But I will suggest to the committee that he rather surprised me. In presenting this case to him I supposed he was like other business men of his type that I have met, and I naturally undertook to show him where he would make money, and more than once he called me down on that angle of the case and said: "That is not what I am after." I have no doubt in my mind whatever that Mr. Ford is perfectly sincere about his intentions at Muscle Shoals, to make Muscle Shoals and the Tennessee River an example of what our water-power resources on our rivers will do for the people of this country.

The CHAIRMAN. It is not necessary to question Mr. Ford's sincerity. I have not heard it questioned by anybody on the committee, at least, in opposition, even, to the acceptance of his offer.

Mr. WORTHINGTON. He stated a number of times to me that he was not going to Muscle Shoals to make money.

Senator McNARY. Now, Mr. Worthington, assume that. He will not always survive this mortal life. I suppose he is a man whose expectancy of years is not so very great. This is a 100-year proposal. What are we to do with the other 85 years, assuming that he lives 15 years longer. Have you thought of that?

Mr. WORTHINGTON. I have.

Senator McNARY. It may be a man who is entirely commercial will take Mr. Ford's place after the latter's death, and we will be tied up to him for 85 years. He may use the power for private gain rather than for public good. There is the other side of the picture.

Mr. WORTHINGTON. I have thought of that; but I feel, in view of our failure in this country to embrace the possibilities of water-power development, as compared, for instance, with Canada, we have lost so much by hesitation and delay that it could be expected in the interests of the country that there would be legislative courage equal to Mr. Ford's courage, and I further think that the people of this country will approve, and I think Congress has shown that it will take care of the situation when it gets to it.

Senator NORBECK. Well, if we sign our rights away first, it will be rather difficult to take care of it, will it not?

Mr. WORTHINGTON. I do not think so. I think whenever the American people make up their minds to do anything they can do it, I do not care what it is.

The CHAIRMAN. As the Senator suggests, we would not want to do anything that would put our successors where they could not help themselves. As the Senator suggests by his question, suppose we sign away these rights. Future Congresses would be bound by that unless they violated our agreement, which, perhaps, even the courts would not permit to be done, and which, I take it, no fair-minded citizen would want to be done. The people would want us to keep our word.

Mr. WORTHINGTON. Your question indicates that you think that is a very valuable property.

Senator NORBECK. I do.

Mr. WORTHINGTON. All right.

Senator NORBECK. I judge that by the figures put in as to the capital and what they are asking for in the way of appropriations to complete it.

Mr. WORTHINGTON. Yes.

Senator NORBECK. I certainly think it is valuable.

Mr. WORTHINGTON. In paragraph 19, as clarified, it states that:

"As a method of procedure in the event of the violation of any of the terms of this proposal, or any contracts made in furtherance of its terms, the company agrees that the Attorney General may, upon the request of the Secretary of War, institute proceedings in equity in the District Court of the United States for the Northern District of Alabama for the purpose of canceling and terminating the lease of Dam No. 2 or Dam No. 3, or both of them."

Senator NORBECK. If there is a violation of the terms of the written contract, not the spirit of it, the written contract is not even with Mr. Ford, but with a corporation to be created, and we do not know who those stockholders would be. The stock may not even be held in Mr. Ford's family. You and I may be holding some of that stock in 20 years from now.

Senator HEFLIN. But, Senator, the contract has not yet been written, and all of that can be stipulated into it.

Senator HARRELD. Mr. Worthington, right along that line, we have the water power act at the present time, which provides for a 50-year tenure of water power, and provides that the Government may, on its own motion, at any time under certain regulations and conditions, take it over. Now, Mr. Ford comes in here, clearly outside of the expressed intention of Congress, and he is asking to lease this and not be governed in any sense of the word in accordance with the intention of Congress in the past as expressed in the water power act. Why does he do that? Why does he not want to get this project under the terms of and subject to the control as prescribed by and provided for in the water power act?

Mr. WORTHINGTON. First, Senator, because the magnitude of this undertaking, the risk of the undertaking, is too great to undertake within a period of 50 years.

The field of electrochemical operations is a very different matter from the general utility business. It takes a great volume of property, and it takes a great deal of capital, and all along Mr. Ford has had only one viewpoint that he insists on. He says that the burden of interest for capital in hydroelectric developments, which goes on, you may say, perpetually, is a thing that is so contrary to the economic industrial welfare of this country that it ought to be stopped. I do not think he would yield that viewpoint at all.

Suppose we apply the 50-year policy in the water power to Mr. Ford's offer. The effect of the 50-years on an amortization fund of \$1 per year at 4 per cent for 50 years is \$158. A dollar per year at 4 per cent for a hundred years is not twice \$158, but it is \$1,287. A 50-year refund requires more than eight times the annual amortization charge that a hundred-year fund requires.

Now, your question, Senator, brings us into a field in which Mr. Ford has shown the very greatest interest, and I believe it is safe to say to the committee that one of the things he is most interested in in connection with the making of Muscle Shoals an example and an object lesson is that at the end of the lease the cost of power will be reduced to the cost of operation and maintenance, and, while some have insisted that he is trying to drive a close bargain to get the United States to furnish him 4 per cent money, so that he will have the advantage of somebody else, the charge is not only untrue, but it is very unfair.

Senator McNARY. Now, let us analyze that statement a moment and see if it is absolutely correct. The amortization applies only to the construction of Dam 3 and the construction of Dam 2. It has no reference to the other investment made by the Government, amounting to practically \$90,000,000, save the \$5,000,000 that he pays for the property and for which he gets the fee simple title to it.

Mr. WORTHINGTON. May I be indulged, Senator, to come to that phase of it a little later on?

Senator McNARY. It is a very easy matter to get a hundred dollars and pay \$1 back and amortize it, but that is a different thing from taking the whole sum.

Mr. WORTHINGTON. Yes; I feel the force of your suggestion, but I wonder if you would let me come to justify that side of it, which he refers to in the nitrate-plant operations.

Senator HARRELD. Let him finish the answer to my question first.

Mr. WORTHINGTON. And deal with this particular case here that the Senator has asked me about.

To illustrate what a burden on industry the interest charge of capital invested in power developments is, just take the case of 100,000 horsepower, for example. Suppose we take an investment at \$200 per horsepower and that we assume a retirement rate at 4 per cent on the principal and interest on the same at a given rate for a period of 50 years, and I call your attention to 100,000 because you might work out a project of that size under the general dam law, which I hope is in part an answer to your question, Senator.

If you take a rate of interest at 2 per cent on a power development costing \$200 per horsepower, the fixed charge per horsepower is \$4 per year. If you take that rate at 3 per cent, it is \$6 per horsepower per year. If you take 5 per cent, it is \$10, and if you take it at 6 per cent it is \$12.

The CHAIRMAN. What is it at 4 per cent?

Mr. WORTHINGTON. And at 4 per cent it is \$8; at 7 per cent it is \$14; at 8 per cent it is \$16, and at 9 per cent, which I expect could be taken as pretty nearly the average rate that power companies have to pay for money, you have \$18 fixed charge.

The CHAIRMAN. Now, Mr. Ford, in his proposition, instead of paying 9 per cent, will pay 4 per cent.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. It is not quite 4; it does not amount to 4 per cent, because he does not commence to pay until the dam is completed, and the government has to put up all the money before it is completed.

Mr. WORTHINGTON. Yes; but you must remember that it is your dam and he is leasing it.

The CHAIRMAN. Yes.

Mr. WORTHINGTON. If you were building a skyscraper you would not expect Mr. Ford to pay room rent before it was finished?

The CHAIRMAN. No; but the government is not getting quite 4 per cent for its money.

Mr. WORTHINGTON. Well, it would be fair to say, under the policy of your river improvements and your appropriations for the same, like on the Ohio and other rivers of the country, something should be charged to navigation.

The CHAIRMAN. Oh, yes; I think that is true.

Mr. WORTHINGTON. I think that is fair.

The CHAIRMAN. Yes.

Mr. WORTHINGTON. The Secretary of War felt that way.

The CHAIRMAN. That is, for the Government; that is true.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. But that does not change the fact at all that Mr. Ford is going to get his money at this particular rate of interest.

Mr. WORTHINGTON. Well, who pays for it. Suppose we take the operation of that nitrate plant at No. 2 and consider his offer. If you charge him 8 per cent, the buyer of the fertilizer would pay for it.

The CHAIRMAN. Yes. I am not complaining about that. I am considering it in connection with the dam.

Mr. WORTHINGTON. So a higher rate of interest would not be justified.

The CHAIRMAN. But the facts are, nevertheless—and we cannot get away from them, and it is not necessary, of course, to even try to get away from them; but what I want to get at is just exactly as it is—that Mr. Ford is paying 4 per cent interest. He can sell it to the Louisville & Nashville Railroad, if he wants to, or use it himself. The Government cannot fix that, as you said a while ago. It is for Mr. Ford to say whether the railroad shall use it or whether Mr. Ford shall use it; but Mr. Ford's representative said that he is going to invest fifty million dollars himself in building machinery down there, and if he is going to use it he is getting the money at four per cent interest. There do not seem to be two ways about that.

Mr. WORTHINGTON. As to Mr. Ford's offer, whether it is accepted or not, I would like to point out how sound the economic principle is that he stands for, that eight and ten and twelve per cent money should not be invested in the navigation and power dams of this country.

The CHAIRMAN. Well, but you say it is.

Mr. WORTHINGTON. We know it is.

The CHAIRMAN. Yes; I agree with you.

Senator HARRELD. Now, Mr. Worthington, under this contract here we would give to Mr. Ford a hundred-year lease. Then, under the water power act,

we would give to some other man certain other water power, but limit it to 50 years in one lease.

Mr. WORTHINGTON. Yes.

Senator HARRELD. In that event, have you not given Mr. Ford an unfair advantage over the fellow that takes the lease under the water power act?

Mr. WORTHINGTON. I do not think so.

Senator HARRELD. It will perhaps affect his right, and even his power, to cope with him in rates, etc.

Mr. WORTHINGTON. First, I do not think so, because I do not think there is anything iron-bound or ironclad about 50 years. I think, Senator, if you would search the history of legislation, you will find that it was a compromise.

Senator HARRELD. I understand that, but—

Mr. WORTHINGTON. And that there is nothing sacred about it, and, moreover, I am sure you will not contend, will you, that if you were investing your money in a project involving 750,000 horsepower, say, that you would want the time to be exactly the same as your neighbor over there, who had only 100,000? Not only that, Senator, this is not the first time you have done it. You have, for instance, at Lock 12, on the Coosa River, where Congress gave a perpetual grant, and at —

The CHAIRMAN. Will you give the dates, if you have them there?

Mr. WORTHINGTON. Well, the first legislation on the subject was probably as early as 1907. May I just be permitted to insert those dates?

The CHAIRMAN. Yes; certainly.

Mr. WORTHINGTON. I can not recall them exactly.

Data on legislation regarding certain power dams built in navigable streams prior to passage of Federal water power act.

Licensee.	Project.	Date of permits.	Dates of act or amendment.	References.
Alabama Power Co.....	Lock and Dam No. 12, Coosa River.	Mar. 3, 1910.....	Mar. 4, 1907.....	34 U. S. 1288.
Mississippi River Power Co., successor to Keokuk & Hamilton Water Power Co., grantee.	Lock and dam near Keokuk, Iowa, Mississippi River.	May 9, 1908, modified Mar. 6, 1911.	Feb. 8, 1901; Feb. 26, 1904; Feb. 9, 1905.	31 U. S. 764; 33 U. S. 56; 33 U. S. 712.
Chattanooga & Tennessee River Power Co., successor to C. E. James and J. E. Guild, grantees.	Lock and dam at Hales Bar, Tenn., Tennessee River.	May 24, 1905; Aug. 23, 1905; Sept. 2, 1905; July 13, 1908.	Apr. 26, 1904; Jan. 7, 1905; Mar. 3, 1905; Aug. 5, 1909.	33 U. S. 309; 33 U. S. 603; 33 U. S. 1133; 36 U. S. 181.

The CHAIRMAN. That is the reason I asked the question. Have we any other legislation of that kind by Congress since the passage of the water power act?

Mr. WORTHINGTON. Oh, no.

The CHAIRMAN. That was when Congress declared its policy?

Mr. WORTHINGTON. Yes; but I was leading up to it—

The CHAIRMAN. Before that these acts were separate and specific acts. The Coosa River one was vetoed, was it not, by the President?

Mr. WORTHINGTON. No, sir. President Roosevelt finally approved it, and it was extended afterwards, and the Alabama Power Co. built the dam at Lock No. 12 under that special act.

The CHAIRMAN. Perpetual?

Mr. WORTHINGTON. Yes; perpetual.

The CHAIRMAN. Congress passed one act, I remember—I do not know whether that was the one or not—which permitted the Alabama Power Co. to develop a dam.

Mr. WORTHINGTON. That was at 18, vetoed by the President.

The CHAIRMAN. On the Coosa River?

Mr. WORTHINGTON. Yes; at 18.

The CHAIRMAN. And the President vetoed that?

Mr. WORTHINGTON. Yes; the President vetoed that. They are building the dam now.

The CHAIRMAN. Under the general water power act.

Mr. WORTHINGTON. Near there.

The CHAIRMAN. As I remember it, the object of the veto there was as to the perpetual right, was it not?

Mr. WORTHINGTON. Oh, no.

The CHAIRMAN. Was it not? I have forgotten it.

Mr. WORTHINGTON. You gave it under the law of 1910.

The CHAIRMAN. No; it was a special act, the one that was vetoed.

Mr. WORTHINGTON. No; it was the act of 1910. Here it is right here.

The CHAIRMAN. Well, there could not be any such thing as a veto if it was under the general law.

Mr. WORTHINGTON. Yes; here it is.

The CHAIRMAN. A veto only applies to an act of Congress.

Mr. WORTHINGTON. No; a veto by the President.

The CHAIRMAN. Then it was a special act.

Mr. WORTHINGTON. Every dam under the law of 1906 and 1910 required—

The CHAIRMAN. No; it was a law that we passed and the President vetoed it.

Mr. WORTHINGTON. Oh, no.

The CHAIRMAN. Of course, Mr. Worthington, your position is not right. The President does not veto a contract. He can only veto acts of Congress.

Mr. WORTHINGTON. Well, he did veto an act of Congress granting this company the right to build a dam on the Coosa River.

The CHAIRMAN. Yes; he vetoed that.

Mr. WORTHINGTON. Yes, sir.

The CHAIRMAN. The building of that dam was controlled by the act which he vetoed, and not some general act.

Mr. WORTHINGTON. Well, I would not pursue it at all. I just leave it with you to look at, because your decision will be final with me, whatever it might be. I was very familiar with the case, and you will remember that the law of 1910 provided that Congress should pass a separate grant under the law for every case.

The CHAIRMAN. Yes.

Senator HARRISON. It was a separate bill that was passed through Congress touching on the Coosa River proposition.

Senator HEFLIN. Giving permission to build this dam?

Mr. WORTHINGTON. Yes.

Senator HEFLIN. That is what he means.

The CHAIRMAN. Yes; that is what I mean, of course.

Senator HEFLIN. As a result of the veto, this cyanamid company, operating at Niagara Falls, went out of the country, and it would have been operated on the Coosa River.

Mr. WORTHINGTON. Let me suggest that it was vetoed because they could not agree on what to pay for the use of the water, but that is an old discussion and is settled now.

I would like to suggest here that, in addition to such statement as I have made to you, Senator, in support of a hundred years that, first, this is not a water power project of the kind contemplated by the present power act. It goes very much farther and has a specific purpose in Mr. Ford's offer, and indeed its primary purpose is to see if the ammonia problem of this country can be worked out.

Senator HARRELD. Well, that might be the purpose of any water power act.

Mr. WORTHINGTON. It might be, but no water power act yet has so declared, and it just happens, does it not, Senator, that the power companies are opposing the Ford offer.

The CHAIRMAN. I do not know as to that.

Mr. WORTHINGTON. Well, it is not, indeed, a thing that I might with propriety mention, but I heard that it was. I would not press the point.

The CHAIRMAN. Well, I do not know, either. I do not know that that is material.

Mr. WORTHINGTON. No.

The CHAIRMAN. But I have not heard anything on that point. I confess, now that you have mentioned it, I feel interested in it.

Mr. WORTHINGTON. I would like to suggest that it does seem to me that, if not unfair, at least it is a very severe test of the fairness of your present power act, to expect Mr. Ford to invest such a large capital as he is going to be called on there to invest, if he ever works this proposition out, and ask him to accept 50 years when the Aluminum Company of America, using the Tennessee River has perpetual rights.

The CHAIRMAN. Now, right on that point, Mr. Worthington, you say when he proposes to invest so much money there.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. Under Mr. Ford's proposition, can that corporation, as provided for, be required to invest anything in development there? Could it be required to invest a penny?

Mr. WORTHINGTON. Well, you will not have to require him if you accept this. He has to do it or quit.

The CHAIRMAN. I know; but the Government furnishes the money to complete the dam.

Mr. WORTHINGTON. Oh, that is different.

The CHAIRMAN. Under that contract, where would he have to invest any money?

Mr. WORTHINGTON. He is bound to invest money in this nitrate plant if he ever works it out.

The CHAIRMAN. No.

Mr. WORTHINGTON. Oh, yes.

The CHAIRMAN. No.

Mr. WORTHINGTON. Why not?

The CHAIRMAN. He can work it as it is now.

Mr. WORTHINGTON. Then, we get into this field—

The CHAIRMAN (interposing). I assume that he will do that. I am coming down to a technical proposition, but I do not know of a thing in his offer there that requires him to invest a penny.

Senator McNARY. \$5,000,000 to acquire the property, Mr. Chairman.

The CHAIRMAN. Yes; he would have to pay that, of course.

Senator McNARY. Yes.

The CHAIRMAN. He can take the power, when it is developed, and instead of building factories there, as he probably will, and as you say he will, but it is not in the contract, and sell it to the Louisville & Nashville Railroad or to the Alabama Power Co. or to anybody else, for any price he sees fit, without any governing board or without any rules or regulations by anybody representing the Government of the United States? Can he not do that under his own proposition?

Mr. WORTHINGTON. Well, in the first place, and in answer to that question, he could not sell this power to the Alabama Power Co., because it can not use it along the lines of its present service.

The CHAIRMAN. They are anxious to buy it. They have made a bid for it, and you say the Louisville & Nashville Railroad wants to buy it.

Mr. WORTHINGTON. Well, Mr. Mapother said that he would be willing to test out one division.

The CHAIRMAN. Is it not true that under this bid, that outside of the \$5,000,000 he pays, he is not required to invest anything? I am not saying that he does not intend to, but I want to make the point that that contract does not compel him to; it does not compel this corporation that he is going to organize, to do it. Now, to be technical, is not that true? If it is not I want it pointed out to me.

Mr. WORTHINGTON. It probably is true; but it could not possibly—

The CHAIRMAN (interposing). Now, what assurance have we that this corporation which he is to organize, when he dies, will not be technical and stand on its technical rights?

Senator McNARY. May I add, Mr. Chairman, that Senator Norbeck calls my attention to the fact that the capital stock of the corporation is \$10,000,000. After paying \$5,000,000 for the plant they would have only \$5,000,000 with which to operate, unless they borrowed money.

The CHAIRMAN. Well, they do not need to operate, except this nitrate plant.

Senator HEFLIN. But he obligates himself to make fertilizer.

The CHAIRMAN. Yes; I say he is to operate the nitrate plant.

Senator HEFLIN. And Mr. Mayo says he is going to manufacture fertilizer on a large scale, and if he does, he will have to invest a good deal of money there. He also suggested that he thought he had a new process by which he thought he could operate.

The CHAIRMAN. Yes; I am putting my question purely as a technical proposition. When Mr. Ford dies, I am assuming that the corporation will be just as technical as they can, as the contract will permit them to be.

Mr. WORTHINGTON. I believe, in order to get along and present the viewpoints that I am rather imposing upon the committee, I would like to direct attention to what seems to be the fundamentals of this thing. There is no problem in this country that is appealing so for solution as the ammonia problem.

Now, while in the past few years the production of phosphoric acid by the electric-furnace process has been commercially solved, and only waits to be put on the volume production basis, the production of ammonia has not been solved. We have got in this country all of the nitrogen we want. There is no shortage of it. It is the cost; and right there I wish to leave this thought with the committee, that is, you decide that what appear to be the possibilities at Muscle Shoals to solve the ammonia problem of the country, Mr. Ford proposing to take the first step—if you insist that those possibilities be written into a contract, I think your case is hopeless.

Senator NORBECK. But Mr. Ford says he will do that providing he can make 8 per cent profit.

Mr. WORTHINGTON. He says he will not charge more than 8 per cent.

Now, if I might continue, suppose this committee to-day was sitting on the case of the Little Tennessee River, and you were back 18 years ago and the Aluminum Co. of America had come here and asked you for a hundred-year grant of that power, and they have perpetual right to it, I think perhaps you have a case there which will at least give the opportunity to make the point that you would perhaps take the same position that you do now about this fertilizer. You would want to have written into the agreement the possibilities, and if you had asked the Aluminum Co. of America 18 years ago on the Little Tennessee River to have contracted and obligated itself to have produced the alloys that they produce to-day you would have driven them away absolutely. They did not know. And just as the Aluminum Co.'s industry in this country has been an evolution, and has gone to its present wonderful position by experience, large capital expenditure, even to the point, Mr. Chairman, that there is 400,000 horsepower applied to that single industry in the United States, so the ammonia industry must be developed, yet not a horsepower is applied to the ammonia industry by these electro chemical methods in this country to-day.

The CHAIRMAN. How much at the Little Tennessee? That is probably right. How much horsepower?

Mr. WORTHINGTON. About 350,000 to 400,000 horsepower.

The CHAIRMAN. How many dams?

Mr. WORTHINGTON. Seven proposed.

The CHAIRMAN. They are not all completed yet?

Mr. WORTHINGTON. No, sir.

The CHAIRMAN. That was about 18 years ago—the granting of the right?

Mr. WORTHINGTON. Oh, no. They did not need a grant. It is not on a navigable stream. It just so happens that the United States Engineers had never designated the Little Tennessee as a navigable stream.

The CHAIRMAN. Then, as a matter of fact, it has not been granted by the Federal Government?

Mr. WORTHINGTON. Not at all.

The CHAIRMAN. Just the State?

Mr. WORTHINGTON. They just went there as riparian owners.

The CHAIRMAN. I see. Then, you can not cite that as a precedent for our action here?

Mr. WORTHINGTON. Oh, no; but I can cite that to say that if it was thought to be a sound thing and desirable to have a perpetual right to the water of the Little Tennessee, and that it is a good thing for the country in developing the aluminum industry, then it is not an unfair thing to say that when the Little Tennessee waters get to the Muscle Shoals Mr. Ford should have a hundred years.

Senator NORBECK. I don't think that is a good thing for the country, but it is a good thing for the real-estate owners right around it. It was not anything done by Congress, but it was something that was just permitted because there was no law concerning it.

Senator McNARY. Is there anything unique in Mr. Ford's offer concerning the fixation of atmospheric nitrogen at this plant? Does not the Alabama Power Co. agree to supply the Government sufficient water power to operate this plant No. 2 to full capacity?

Mr. WORTHINGTON. Yes, sir. The Alabama Power Co. proposes to furnish you secondary power.

Senator McNARY. Let me ask you this question: I think we are all in accord in the thought that what we want to do is to solve the ammonia question. But supposing a process was discovered that was cheaper than the cyanamid or the Haber or the arc processes, would not the Government be in position to operate the plant and every item of horsepower for that great purpose?

Mr. WORTHINGTON. Well, in answer to that question, the Government could be in a position to do so, but you have to remember that the Government has had some time to move in this matter and it never has moved.

Senator McNARY. So that if you are going to place this whole proposition upon a fertilizer basis, we only have Mr. Ford tied up to approximately 110,000 tons of sulphate of ammonia.

The CHAIRMAN. No; not sulphate of ammonia.

Mr. WORTHINGTON. No; ammonium nitrate.

Senator McNARY. Oh, yes; ammonium nitrate, then. We only have him tied up to 110,000 tons, where there is a sufficient horsepower to make, perhaps, 10 times that much, and if it was found to be a good thing the Government could go ahead and do the very thing you want, whereas we could not compel Mr. Ford's organization to do it for a hundred years, and you couldn't then, even.

Mr. WORTHINGTON. That is, of course, for you gentlemen to decide, and I would like to continue on this ammonia problem just a little, please, if I might.

The CHAIRMAN. Yes, sir.

Mr. WORTHINGTON. When the aluminum industry was put on a water-power basis aluminum was worth \$1.25 to \$1.50 a pound. It is now selling, I believe, as low as 17 cents a pound, with quite a number of very useful alloys. I think that it is fair to expect that in part the committee will have to show some confidence in Mr. Ford. If they are not willing to back his courage—it is the most courageous proposition that any business man ever made in this country, and he is willing to undertake the solution of the ammonia problem of the country. It is a question solely to decide whether you will permit him to undertake it or whether you will undertake it yourselves. Now, in undertaking it one may have confidence that the Government will accomplish it, but I venture to suggest to you that you may discover, for instance, a process like, for example, the recent process that has come out, concerning which very little has been published, if anything—the Casale process. It is claimed for that process that they can make ammonia for 5 cents a pound.

And, if you please, in resisting the suggestion of Government operation, first I have no business to come here and argue with Senators of the United States on that subject, and I will not, but this thought—and I do not intend to predict to you what Congress will do. I once thought maybe it would do certain things here about Muscle Shoals, but I have learned something about that proposition. I suggest to you that if you wished to use the Casale process and they wanted a million dollars for entrance fee into this country and a cent a pound you would get that thing through Congress in about five years—just about five years.

Senator McNARY. As quick as that?

Senator HARRISON. You are speaking from experience?

Mr. WORTHINGTON. I am speaking from experience.

If Mr. Ford found out that was a good thing he would decide about paying a million dollars just about as quickly, and a little quicker, perhaps, than he would sign this contract, and it took him only 30 days.

The CHAIRMAN. I think it ought to be said there, in defense of my own bill—

Mr. WORTHINGTON. Do not understand that I am making any criticism of your bill.

The CHAIRMAN (continuing). That it would not take that board provided for in that bill, perhaps, any longer to make a decision than it would Mr. Ford. It would not have to go through Congress. It does not follow, under my bill, that if the Government took it that would have to go through Congress.

Mr. WORTHINGTON. I am not entering into any discussion with you about that at all. I am just calling your attention to this fact, Senator Norris, that unless there is a change here it will be a long time before you get your bill.

The CHAIRMAN. I think that is right. I think there is no doubt about that.

Mr. WORTHINGTON. Coming back to this ammonia problem—and I hope you Senators will bear with me a little, because I do not think it is understood—

The CHAIRMAN. I am sure we will be glad to hear you.

Mr. WORTHINGTON. I don't believe this ammonia problem and its necessity in this country is understood. Just suppose you can make 5 cents a pound ammonia. Just take it during the war period and see what kind of bill you paid. During the war period of 1914-1918, inclusive, the importations of Chilean nitrates amounted to 5,081,578 pounds. The valuation at the Chilean port, plus \$12.53 export tax here, plus \$25 average war-time ocean freight, the total value of \$371,508,000 that this country paid during the war period, 1914-1918. The average delivery at port would be \$73.10 per ton, or 16 cents per pound, of ammonia.

At 5 cents a pound for ammonia the war bill would have been \$103,908,000 against \$371,508,000, or a saving in this single war material for this one war of \$268,600,000.

Of course I know how usual it is to say, "Well, figures don't amount to anything," but that is a fact. If 5-cent ammonia had been available in the United States since 1867, the year in which we have the first record of the importation of Chilean nitrates into the United States, the country's nitrogen bill between 1867 and 1920 would have been \$273,700,000 instead of \$821,184,000. The country would have saved \$547,484,000—a saving of more than \$10,000,000 a year.

Well, I don't know of anybody in the United States that has had the courage to make a proposition or that has had the courage to propose to get into this problem except Mr. Henry Ford. Moreover, I do not know anybody in the United States that could be found to do it, or that has the money to do it. It is all very well, Senators, to talk about experts. Sometimes I have thought that we would be saved from them, but the man that goes and takes out a proposition of his own, with his own money, and displays that American initiative that has built up this country, that is the man that I would love to listen to as an expert, and I would like to ask you, even urge upon the committee, that you send for Mr. Swann.

The CHAIRMAN. Whom?

Mr. WORTHINGTON. Mr. Theodore Swann. I urge you to send for him and get him to tell this committee of his struggles in working out the phosphoric acid problem that he has had, and I have not any doubt but what you gentlemen who now think that you might possibly, to the welfare of the country, hasten into Government operation at Muscle Shoals will hesitate. He came very near failing two or three times, but he succeeded. Well, there is a very vast difference between that kind of expert testimony and the man that comes to this committee and tells you this process will do or that process will do, this process is obsolete, and a certain process is the best process. There is a vast difference between Mr. Swann's experience at Anniston, Ala., and testimony that he may give as compared with, for instance, your own laboratory experience at Arlington in the very same line.

Now, I think if you sent for Mr. Swann and got him to give his experience of what he has accomplished and show what he has made and what it means, and then if we might hope that the committee would have reason to lend Mr. Ford a little imagination, you could see what a problem he would attempt to work out to get the needed thing for soil food, namely, enough more ammonia, cheaper ammonia, at 5 cents a pound. I don't mind if I do violate confidence right in the presence of Mr. Mayo to tell this committee that he has shown that the thing he is interested in and the thing he has investigated and inquired about is not whether you could make ammonia at Muscle Shoals, but is it possible to make 5-cent ammonia, and any other attempt is a waste.

Take the ammonium sulphate production, the selling price of which normally runs right along with Chilean nitrates. Ammonium sulphate, 24 per cent ammonia, the cost is \$3.50 per unit of ammonia, or 15 cents a pound. Sodium nitrate, 20 per cent ammonia, is selling at \$2.80 per hundred pounds, which gives 14 cents a pound for ammonia.

Now, I have given you some figures here, and if the chairman and the committee do not object, I would like to have this sheet showing the importations put into the record.

(The CHAIRMAN. All right. Give it to the reporter, and it will go right in with your testimony.)

(The statement referred to is as follows:)

Nitrate of soda imports from Chile to United States.

[Extract from hearing before the Committee on Agriculture and Forestry, United States Senate, Sixty-sixth Congress, second session on S. 3390.]

[Statistics from Bureau of Foreign and Domestic Commerce, Department of Commerce.]

1 None.

NOTE.—The value given here is based on the value at the port in Chile, and does not include export duty paid to the Chilean Government, ocean freight, insurance, commissions, etc. Before 1914 freight from Chile to the United States was about \$7.50 per ton; at the present time it is about \$17.50. In 1879 an export duty was put on nitrate shipments from Chile and amounted to about \$4.18 per long ton. In 1880 this duty was raised to \$12.53 per long ton and has not been changed since that time. The export duty paid to the Chilean Government on all nitrate of soda coming to the United States up to July 1, 1919, would amount to \$163,647,680.6827.

Value at Chilean port.....	\$480,087,147.92
Export duty to July 1, 1919.....	163,647,680.68
	<hr/>
	643,734,828.60
Ocean freight, insurance, commissions, etc., from 1867 to 1919.....	177,448,795.52
	<hr/>
Total.....	821,183,624.12
Estimating the same 10-year increase in shipments of Chilean nitrate to the United States, our bill to Chile since 1867 will stand in 1928 (on the basis of nitrogen consumption doubling every 10 years).....	578,860,821.06
	<hr/>
Total.....	1,400,044,545.18

Mr. WORTHINGTON. Take the single thing of cottonseed meal. If you credit the phosphoric acid, potash in cottonseed meal, carrying about 8 per cent ammonia, and takes cottonseed meal selling at \$45 per ton, and credit your phosphoric acid, and you get it down to \$41.56 a ton for cottonseed meal. That is 26 cents a pound for ammonia. Why, there is no more horrible waste or criminal thing that you could do economically than to put the food of cottonseed meal under the cotton plant to make more cotton. And let us apply that. We use about 800,000 tons annually of cottonseed meal as fertilizer—just about. In 1914 I believe we used 800,000 tons. Why does the cotton farmer do it? Because he has no cheap ammonia to put in place of it. If he did, he would send part of that to Nebraska to feed their cattle, and to New England, as well as to export it.

The CHAIRMAN. When he uses it as a fertilizer he mixes it with something else, does he?

Mr. WORTHINGTON. No; sometimes he does and sometimes they use cottonseed meal just straight.

The CHAIRMAN. They do?

Mr. WORTHINGTON. Yes; the saving I may refer to a little later, if the committee would permit me, because it does present a most stirring proposition that you are using food to fertilize a cotton plant when you have got the nitrogen in the atmosphere, more than 30,000 tons on every acre, if you can get it out and put it into ammonia, say, at 5 cents a pound.

The CHAIRMAN. It is like burning corn for fuel in the West, is it not?

Mr. WORTHINGTON. It is quite as bad. Mr. Chairman, will you let me refer to that cottonseed meal again and get into the record some illustrating data on the subject?

The CHAIRMAN. All right, Mr. Worthington.

Mr. WORTHINGTON. Let us compare 15-cent ammonia against 5-cent ammonia just a little further, if the committee will be patient.

Take the case of a farmer applying 150 pounds of ammonia sulphate, for instance, per acre, and he gets an average increased yield of corn and cotton. The average increases were presented to the House committee by Doctor Whitney. One hundred and fifty pounds of ammonia sulphate is 36 pounds of ammonia. Thirty-six pounds of ammonia at 15 cents a pound is \$5.40. You get an increase according to Doctor Whitney's statement, of 4 bushels of corn per acre. The cost of the additional corn would be \$1.35 a bushel. If that farmer could get 5-cent ammonia, 36 pounds would cost \$1.80, and the cost of the additional corn would have been 45 cents a bushel.

The CHAIRMAN. It is still too high.

Mr. WORTHINGTON. Well, I am sure there may be in the future, in the evolution of working out of this problem, the possibility that you may get ammonia for less than 5 cents. I think you will. But it will cost a bundle of money to do it, and rather bitter experience at times, I expect.

Take cotton. Assume an average increase due to fertilizer of 54 pounds per acre, although most cotton land in the South, in most of the States, will hardly produce any crops of cotton at all without fertilization, the cost of your additional cotton with 15-cent ammonia is 10 cents per pound of cotton. The cost of this additional cotton at 5 cents for ammonia is 3½ cents per pound of cotton.

We use, I believe, about 7,500,000 tons of fertilizer in this country annually in normal years. Keeping in mind the difference between the cost of ammonia at 15 cents a pound and the cost at 5 cents a pound, let us see what has happened in the consumption of commercial fertilizers in this country, say between 1913 and 1919, and let us see where the growth has occurred.

New Mexico has increased 650 per cent, South Dakota 328 per cent, and in the Western States, which they say are arid, the increase has run from 100 per cent in Colorado to 650 per cent in New Mexico. Michigan 78 per cent, Oregon 67 per cent; and the figures run along in the twenties down until you get through Massachusetts. And right there, there is a significant thing, that during the war, with the cost of fertilizer per ton mounting skyward, the consumption curve of New England and the Middle West went right along.

The CHAIRMAN. You mean the consumption of fertilizer?

Mr. WORTHINGTON. The consumption, the purchase curve went right along persistently, even in the face, Senator, of the cost increase of perhaps 300 per cent. I should say the cost increased at least three times. In South Carolina, however, he could not get it out of the cotton, and the consumption of South Carolina dropped more than one-half.

That illustrates the whole thing, and if you have worked this problem out it is merely a question of putting electricity to work on the farm as an agricultural laborer. That is all it is. We have put electricity, as I tried to suggest this morning, to work in nearly every industry in the country in a most wonderful way, except on the farm. Of course if the committee cannot grasp that Mr. Ford's imagination is aroused and his ambition fired by this, I don't think you will have got the Ford viewpoint at all.

The CHAIRMAN. I think the committee does grasp it. They get the idea, but the difficulty is that unless we can get Mr. Ford's viewpoint put into a contract we can not expect results after his death.

Mr. WORTHINGTON. You can not contract American industrial ambition. You can not translate that into a contract. That American initiative is something that can not be put into words and signed and nailed down at dollars per pound. That can not be done. I don't think, Senator, you will—

The CHAIRMAN. No; I get your idea exactly, I think, but, on the other hand, there is not anything in this proposal of Mr. Ford's that ties him down. He is all right. He is going to do the best he can. He is moved by the best of motives.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. To all of which I agree, but you do not say, of course, that he is going to live beyond his allotted time, and that is where the thing falls down.

Mr. WORTHINGTON. It is just the expression of personal opinion. I would rather have Henry Ford untied at Muscle Shoals than most anyone I know tied.

The CHAIRMAN. Assume that to be true. Assume that everybody wanted to do that. Unless we can negotiate with God Almighty and have Him give an extension of life we can not have that worked out, even if both sides agreed to that.

Senator HARRELD. You might get Conan Doyle to do it.

Mr. WORTHINGTON. In regard to the 100-year period, the committee will concede one thing, I think, that if a business man like Mr. Ford felt it was absolutely impossible for him to do the thing in 50 years, that is just a matter for the committee to decide whether they will depart from what appears to be a very fixed policy as to time, or will make an exception in this case.

Mr. Chairman, there is one thing that has run through these discussions and hearings ever since 1916, and that is this, that with these new methods of producing fertilizer compounds we could hope to produce fertilizer and sell it to the farmers of the country for about one-half what they have been paying for fertilizer in normal years. The accomplishments in producing phosphoric acid by electric furnace methods seem to prove that. Our country or our Government has not been interested in this ammonia problem like other Governments, has not taken the interest in it, and, for instance, we may contrast what we have done with what the English did after the war. There is their research report, and here is a supplement. It might interest the committee to know that while it is generally understood that Japan has got the right to use all of the processes that have been carried to anything like a commercial stage for producing nitrogen by the air-fixation process, I understand that in the case of this Casale process, which promises to produce ammonia cheaper

than any that have come out to date. Japan has already secured the right to use it and has paid a high price for it.

The CHAIRMAN. What can you tell us about the Casale process?

Mr. WORTHINGTON. It is a process requiring about the same power as the cyanamid process, but you don't have any coke or any lime or any of those steps of the cyanamid process; that through the production of hydrogen, using an electric cell, you get pure hydrogen.

The CHAIRMAN. That is one of the difficulties in the cyanamid process, is it not?

Mr. WORTHINGTON. I was just going to say that that is what they particularly claim is the excellent thing that they have accomplished. And that goes on, of course. You can go from pure hydrogen, and you can get nitrates of ammonia or ammonium sulphate or ammonium phosphate. I am sorry that what information I have on the subject as a layman I am compelled to tell the committee I can not divulge.

The CHAIRMAN. Is it a patented process?

Mr. WORTHINGTON. Oh, yes.

The CHAIRMAN. Who owns the patent?

Mr. WORTHINGTON. It is a company that has been formed in Switzerland, I believe.

The CHAIRMAN. It is patented in all countries, I suppose?

Mr. WORTHINGTON. Oh, yes. The Japanese have secured the right to use it. The Aluminum Co. of France, the French Alumtaum Co., have acquired the right, and it is rather interesting right there that the Aluminum Co. of France should get it, since you, of course, have heard that the production of fertilizer as a by-product in connection with the aluminum industry might be looked for. The Swiss Government—or, I think, a Swiss company—is negotiating for the use of it in Switzerland, and a very interesting thing I was told was that Doctor Caro and Doctor Frank, of Germany—Doctor Caro and Doctor Frank, as you know, are the scientists that worked out the cyanamid process—have been trying to secure the Casale process rights for Germany.

The CHAIRMAN. Are they both Germans?

Mr. WORTHINGTON. They are both Germans.

The CHAIRMAN. I thought the process was first developed in Norway.

Mr. WORTHINGTON. No, sir. That is the arc process.

The CHAIRMAN. Oh, yes.

Mr. WORTHINGTON. Those two German scientists, Doctor Caro and Doctor Frank, developed the cyanamid process, and I understand that they have been negotiating for some time to get the right to use the Casale process in Germany, their difficulty being the German mark—

The CHAIRMAN. Is it known how much it will cheapen the operation?

Mr. WORTHINGTON. If it reduces it to 5 cents, it will reduce it two-thirds. Ammonia is not produced in this country—

The CHAIRMAN. That is, the ammonia would be produced for that.

Mr. WORTHINGTON. And, of course, to-day it costs about 15 cents to produce it. I believe that Major Burns reported that they might produce ammonia at nitrate plant No. 2 at 15 cents a pound, but he did not charge any interest in and he put the power at three-fourths of a mill per kilowatt. That is \$4.90 per horsepower-year, which is pretty low. And then, perhaps there were other things that were left out. I don't think anybody claims that you can produce ammonia by any of these modern electric processes under 15 cents. Do you think so?

Mr. WALDO. No.

Mr. WORTHINGTON. No one that I know of.

The CHAIRMAN. While it might be a little diverting, you have mentioned the inventors of the cyanamid process, and I wonder are they in Germany now getting nitrates out of the air by the operation of a plant using the cyanamid process?

Mr. WORTHINGTON. I think I have the data on that. In connection with that question, it has been stated, of course, and insisted by some, that the cyanamid process is obsolete. Well, in some ways I expect that that statement is subject to doubt, and that when some who are perhaps accepted authorities insist that that process is obsolete they forget that it may be that some of its possibilities have never been worked out; and the committee will grant that there has been a great deal of confusion about the different kinds of processes. That is in the record. The only way to solve that confusion is to find out which is the cheaper; and you will have to go, like Mr. Swann has done.

beyond the point of mere expert opinions, and you will never know until you do it. But this information is at hand with regard to the cyanamid situation in Germany. About a year ago the representative of the Department of Commerce in Berlin, Mr. Howard W. Adams, reported that Germany was producing 600,000 tons of cyanamid annually.

The CHAIRMAN. And how much by the Haber process? Does the report give that? She is producing by the cyanamid process?

Mr. WORTHINGTON. Mr. Adams reports a capacity of 300,000 tons of nitrogen, a capacity of a million and a half tons of sulphate of ammonia.

The CHAIRMAN. By the Haber process?

Mr. WORTHINGTON. By the Haber process.

The CHAIRMAN. That is considerably more than they are getting by the cyanamid process?

Mr. WORTHINGTON. Oh, yes. I think there is more produced.

The CHAIRMAN. What power do they use? I understand they have to use coal.

Mr. WORTHINGTON. They do use coal. They have some water-power development in Germany.

The CHAIRMAN. Yes; I suppose they do have some.

Mr. WORTHINGTON. It is mostly lignite coal, and they insist that they can produce power with their lignite coal nearly as cheaply as we can make water power.

The CHAIRMAN. Do you know what their power costs?

Mr. WORTHINGTON. No, sir.

The CHAIRMAN. It would be interesting to know. I do not know why, without water power, Germany is doing the thing that we find almost impossible to do, with the cheapest power we can get in the way of water power, and if she is doing it why can't we? Is the process just the same?

Mr. WORTHINGTON. The cyanamid process is just the same as the one that you used at nitrate plant No. 2.

The CHAIRMAN. If it costs her as much for the fertilizer as it costs us if we were doing that, her products, when she produces them, instead of being under ours would be away above. It seems that there is something about it that has not been explained by anybody.

Mr. WORTHINGTON. I do not know that that would be satisfying, but I think I could make a suggestion to you to illustrate the case.

Before the war the United States Steel Corporation kept a committee of experts in Germany all the time, and the assistant to the president of the Steel Corporation told me that with the committee over there we could not find out what they were doing.

The CHAIRMAN. That would rather indicate that they had a process superior to ours—more economical. Now, I would like to find out whether or not that is a fact—if they have any process that we do not know about now.

Mr. WORTHINGTON. Well, Mr. Chairman, do you think we will ever get that kind of information until our Government takes some organized interest in this subject?

The CHAIRMAN. I am afraid not, Mr. Worthington, but I would like to know what the facts are now.

Mr. WORTHINGTON. Other countries are keeping right up with it, and they are showing the keenest interest in it, and we don't.

In connection with Germany's operations—and referring back to that thread of information, however it may have been doubted by some, it did persist through the hearings that with this development that we have already made, along with others that might be added at Muscle Shoals, you could make fertilizer at one-half what it costs. There is an example of the review and study by the English of this whole problem.

The CHAIRMAN. They are not making it, as I understand it.

Mr. WORTHINGTON. Oh, yes; they have a plant they are building in England.

The CHAIRMAN. What process?

Mr. WORTHINGTON. I think they are using the cyanamid process.

Mr. WALDO. Both.

Mr. WORTHINGTON. Both the cyanamid and Haber processes.

The CHAIRMAN. Is that since the war? They did not have any plant during the war, did they?

Mr. WORTHINGTON. They started it, Senator, during the war, and really had not progressed very far when the war ended, and they turned it over to Messrs. Brunner, Mond & Co. (Ltd.).

The CHAIRMAN. They use coal for power, I presume?

Mr. WORTHINGTON. Oh, yes.

The CHAIRMAN. And are they making fertilizer?

Mr. WORTHINGTON. What production they have now I don't know.

Mr. WALDO. They are producing from six to seven thousand tons of nitrogen annually.

Mr. WORTHINGTON. They are producing six to seven thousand tons of nitrogen annually. This report says, though, Senator Norris, that the work, however, is being laid out so that this small nucleus may be quickly enlarged to 100 tons per day. That is nitrogen, and when you get to a capacity of 300 tons per day, or about 80,000 tons of nitrogen annually, that is twice the capacity of nitrate plant No. 2.

The CHAIRMAN. That is more than nitrate plant No. 2?

Mr. WORTHINGTON. Twice as much.

The CHAIRMAN. They have not built that.

Mr. WORTHINGTON. They are laying down the works to do it.

The CHAIRMAN. I understand nitrate plant No. 2 is the largest of its kind in the world.

Mr. WORTHINGTON. It is.

The CHAIRMAN. Can you tell us what the power costs to make this in Great Britain?

Mr. WORTHINGTON. No; I don't know.

The CHAIRMAN. Are we able to get the secret from Great Britain? She is one of our allies. I suppose she would give it to us freely, wouldn't she?

Mr. WORTHINGTON. I should think so. I have already suggested, in connection with this subject, to one of the officials in the Department of Commerce, that this country ought to set up a permanent nitrogen commission with plenty of money, of the ablest selection you could make, and they ought to keep up with the subject in other countries.

To go back again, Mr. Chairman, to what Dr. Caro said in 1919. In discussing Germany's capacity for nitrogen fixation, he reviewed the subject from the German standpoint, and he said that:

"Another thing we who fear that German national industry will be able to cope with foreign competition in view of high wages and high costs of combustibles can not be at present predicted, since the cost of coal, which in the future is sure to be one of the most important items of expense"—

Just right in line with your inquiry—

"can hardly discuss the lime nitrogen cyanamid industry on account of its unusually small consumption of coke will be in a very favorable situation. This will be particularly true when the construction market sinks to some half-way normal level, so that the capital cost of water-power development will be more reasonable."

He says this significant thing:

"Far more dangerous than competition of Chilean nitrate appears to be the possibility of competition of artificially fixed nitrogenous fertilizers produced in foreign countries. The largest of these foreign nitrogen plants is located in the United States, in Alabama. Its situation is most excellent."

He refers to the fact that Muscle Shoals is connected with—

The CHAIRMAN. Read what he says about Muscle Shoals. I am interested to know what foreigners say about it.

Mr. WORTHINGTON. He says, "It is connected with the ocean by means of the Tennessee River, which has been made navigable. It is situated at a source of almost constant water power amounting to 400,000 horsepower, and is right in the midst of the locality where all the raw materials of the lime nitrogen cyanamid industry are present in the highest purity and at the very lowest prices."

Now, this is the significant thing he says, according to my view:

"Nearby are the inexhaustible deposits of phosphate rock. A possibility therefore exists of producing cheaply ammonium phosphate containing 45 per cent water-soluble phosphoric acid and 20 per cent nitrogen."

Now, in that connection I have no doubt that Doctor Caro had in mind a cheap ammonia, even a cheaper ammonia than he can produce by his cyanamid process.

Senator NORBECK. Mr. Senator, there is another question I would like to ask this witness.

The CHAIRMAN. All right, Senator.

Senator NORBECK. I would like to get clear on what part of the cost of nitrogen is really the power itself. We seem to rely on cheap fertilizer because we have cheap power.

The CHAIRMAN. Senator, that depends on the process a good deal.

Senator NORBECK. On the processes that are now in use.

The CHAIRMAN. All right. Can you give us that?

Mr. WORTHINGTON. Would you allow us to put that in the record and hand it to you?

Senator NORBECK. Certainly.

Mr. WORTHINGTON. Probably it would be more accurate.

NOTE.—The following estimates are taken from the figures submitted by the Ordnance Department before the House Committee on Military Affairs, April 19, 1920.

Estimated production cost of commercial cyanamid per ton, using steam power	\$31. 10
Cost of power used at 4 mills per kilowatt hour	11. 23
Proportion of total cost represented by the cost of power.....per cent..	36. 1

Senator HERRELD. Did I understand you to say that in England they have made a contract with a private company to develop the phosphate resources—I mean the nitrogen resources? Did I understand you to say that in England they had made a contract with a private concern to produce nitrates for the Government?

Mr. WORTHINGTON. Oh, yes. We will put the information you ask for in the record, but I am now answering you, Senator, that, as stated, the English have started development during the last stages of the war, and they were to use the synthetic process at a factory at Billingham, England, designed to manufacture about 60,000 tons of ammonium nitrate annually for war purposes. This was commenced by the Ministry of Munitions early in 1918, but at the time of the armistice was only very little advanced. It has since been taken over from the Government by Messrs. Brunner, Mond & Co. (Ltd.), and is being redesigned to manufacture peace products, chiefly fertilizers, and the rest of it we will put in as a full story.

Senator HERRELD. That is all I wanted to know. I just wanted to know if they were working on it through private industry.

BRITISH DEVELOPMENTS IN NITROGEN FIXATION.

[Statistical supplement to the final report of Nitrogen Products Committee of the Ministry of Munitions, p. 21.]

The synthetic ammonia factory at Billingham, designed to manufacture about 60,000 tons of ammonium nitrate annually for war purposes, was commenced by the Ministry of Munitions early in 1918, but at the time of the armistice was only very little advanced. It has since been taken over from the Government by Messrs. Brunner, Mond & Co. (Ltd.), and is being redesigned to manufacture peace products, chiefly fertilizers. The subsidiary company they have promoted, Synthetic Ammonia & Nitrates (Ltd.), which will have a capital of £5,000,000, is at present concentrating upon designs for an initial plant to produce 25 tons of ammonia per day, or about 6,000 to 7,000 tons of nitrogen annually. Their works are, however, being laid out so that this small nucleus installation may be quickly enlarged to 100 tons per day, and afterwards to a maximum capacity of 300 tons per day, or about 80,000 tons of nitrogen annually. The original Government site of 260 acres is being increased to about 1,000 acres in all, and two ship berths on the River Tees have been acquired. This increased accommodation has been found necessary in order to give ample room for the development of the whole scheme, which includes the manufacture of a number of by-products. There is also to be an oxidation plant of a capacity of 10,000 to 12,000 tons of nitric acid annually.

A British company, Cumberland Coal Power & Chemicals (Ltd.), has also been formed to erect works in England to operate the Claude process for the manufacture of synthetic ammonia. Information to hand states that a full size commercial ammonia unit, working at a thousand atmospheres, is now running satisfactorily in France, producing at the rate of 5 tons of ammonia per day.

The British Cyanides Co. are continuing at Birmingham their large scale experiments on fixation of nitrogen by the barium process, employing fuel-heated furnaces. Though these experiments have been partially successful, final conclusions as to the ultimate possibilities of the process have not yet been reached.

The works erected at Dagenham by the Nitrogen Products Co. to manufacture ammonium nitrate during the war period from cyanamide by the Ostwald process are now closed.

Mr. WORTHINGTON. It is rather interesting to know that Germany, with a population of 65,000,000 has 8,830 tons of nitrogen per million of population, while the United States has 1,480,000 tons capacity for producing nitrogen.

Senator HARRELD. Per million population?

Mr. WORTHINGTON. Germany has 8,830 tons per million of population against our capacity to produce 1,480,000 tons per million of population. That answers the question how can Germany feed by their own crop production nearly 65,000,000 people.

Senator HARRELD. Now, reverting to that statement that England has given a contract to make nitrates or turned over the nitrate business to private organizations, are there any of the governments producing nitrates as a government project at the present time?

Mr. WORTHINGTON. None that I know of solely under government direction and organization.

The CHAIRMAN. Is not Germany?

Mr. WORTHINGTON. I don't think that Germany is. Germany has an organization that is part commercial. Am I right about that?

Major BURNS. That is as I understand the German system. It is a Government subsidy in the production of nitrogen.

Mr. WORTHINGTON. Yes, sir. In France I am sure that the operations are all under private enterprise, and in Japan that is so, too. I think that, perhaps, the Italian Government has helped the industry in Italy. I don't know how much.

There is one phase of it. I don't know that it could be considered as favoring the acceptance of Mr. Ford's offer at all, but it seems to me it is one phase of this Muscle Shoals case that is overlooked, and that is the increased taxable value of property that will be created by this water-power development and its application. You take North Carolina as an example. It was one of the poorest States after the Civil War of all of the Southern States, and North Carolina stands eighth now, as of the fiscal year 1920, as an internal revenue taxpayer. She pays more Federal taxes than any New England State except Massachusetts. She pays more taxes than Missouri, more than Indiana, and more taxes than Texas. She pays more taxes than New Jersey. She pays more taxes than Minnesota.

The CHAIRMAN. You are speaking of Federal taxes now?

Mr. WORTHINGTON. Federal taxes.

The CHAIRMAN. Internal revenue?

Mr. WORTHINGTON. Yes, sir. Now, let us see what the explanation is. Of course, the first thought is tobacco, but when you investigate the matter you find that North Carolina has about 300,000 horsepower developed. It is stated here as 298,900 horsepower. South Carolina has 140,400 horsepower; Georgia, 129,400 horsepower; and Alabama, 92,000; Tennessee, 112,700; and you have got a total in that group of five southern States of 773,400 horsepower.

Senator HARRELD. Since Government taxes are based on profits, that might be an indication of a good deal of diversified production down there, or it might be an indication of profiteering, might it not?

Mr. WORTHINGTON. In any event, I should say it was an incident of the Government getting some money out of profiteers, and they do not usually do that.

Senator HARRELD. We are trying to fix Mr. Ford so that his profits will not be large and so the taxes will not be there.

Mr. WORTHINGTON. In any event, when you take wasting water and put it to work, you will be doing a good thing for the country.

Senator HARRELD. Yes; I was just speaking in a sarcastic vein.

Mr. WORTHINGTON. You gentlemen, in considering this, please bear in mind in the last 25 years there has only been 773,400 horsepower developed in those five States. There is one thing that will occur to anyone considering the development of water power in those five States, and what has happened at Niagara Falls in about 25 years, about 700,000 horsepower, that this Muscle Shoals project is too big for anybody except the Government and somebody as big as Henry Ford. Nobody of small means is capable of working it out, and if you gentlemen had 25 years back been considering those waterpowers in those five States you would not have got anybody to undertake to develop them and commence paying you on the cost of the development in six years. And so at Niagara Falls, you could not have nailed anybody down in a contract to do that.

There is one phase of this case, Mr. Chairman, whatever you do with the Ford offer, we very much wish to get you and the committee to help us about.

The trouble about the Tennessee River case, since this power proposition at Muscle Shoals has been considered, has been to get surveys made. It took us nearly seven years, I think it was, to get a complete detailed survey of these two dams and their overflow lands at Muscle Shoals.

The CHAIRMAN. Well, I might suggest right there that if you will help us pass my bill, it provides for a complete survey of the Tennessee River and all its tributaries.

Mr. WORTHINGTON. I will do that, perhaps, if you might guarantee this little matter of mine; but you have asked me for such a large job as against a rather small favor that I hope you won't raise the point. But let us urge upon you that in the interest of the Government, if you do not let Mr. Ford have this, have appropriation made in the present rivers and harbors bill to survey these upper powers. You control them. No survey made by any company or any engineer except your own Engineer Corps will be accepted.

The CHAIRMAN. The rivers and harbors bill has not been used for the purpose of coordination in development. It is looking after navigation exclusively. Now, while navigation on the Tennessee River is of considerable importance it is a minor thing as compared with the power.

Mr. WORTHINGTON. Well, sir, Senator Norris, we made a good hard fight in 1920 and we got into the rivers and harbors act authority for the survey of the Tennessee River and its tributaries in North Carolina, Tennessee, Alabama, and Kentucky—a coordinated survey, complete, and we have never been able to progress. It is not nearly completed. It will cost a very considerable sum of money; but if it could be completed, and promptly, we perhaps might get some other people to build some dams on these upper streams. It is impossible, Mr. Chairman, to get anything done until the surveys are made, and it requires surveys that are detailed—the height of the dam, its length, and also such tests and foundations as will enable the United States engineers to say, "Yes; the dam may be built."

The CHAIRMAN. Why, sure; so they can take definite action on it.

Mr. WORTHINGTON. Nobody can go and build any dams on the upper Tennessee River. I have been told that the Aluminum Co. of America spent a very large sum of money in making an exhaustive survey of the Little Tennessee. There are some very attractive powers on the tributaries of the upper Tennessee River, but we can not do anything with them unless the United States Government will have them surveyed, and maybe then we can get somebody to build them; and I suggest to you—

The CHAIRMAN. Often these reservoirs, with their dams, will develop power as well as water, but I suppose there will be some that will probably be purely reservoir propositions, and private parties can not do that. You can not expect them to do it, because if you have a dam at one place and I have it at another, and you hold back the water, I get as much benefit as you do. The Government is the one that ought to do that and then make everybody contribute.

Mr. WORTHINGTON. But, taking the history of the Tennessee River for nearly a hundred years, it is vastly more important—and I am sure you won't disagree with that view—than even if some little navigation improvement on the Tennessee River had to wait, it is more important that the money be spent now to determine by detailed surveys what the Government owns, controls, and has there.

I don't believe, Mr. Chairman, that I have anything else to furnish you with.

Senator HEFLIN. Mr. Worthington, don't you believe if the Government should take over this project, the interests about in the country that oppose using it for the purpose of making fertilizer would delay the completion of it for years and years and years?

Mr. WORTHINGTON. Well, I don't know what they would do. Of course, it is known that it has been delayed. I don't know what will happen in the future, Senator.

Senator HEFLIN. Well, don't you think, though, they would use their influence to prevent the completion of—

Mr. WORTHINGTON. Judged by the past I would say that would be expected.

Senator HEFLIN. Why do you suppose the fertilizer trust is opposing the Ford bid to-day?

Mr. WORTHINGTON. Well, they know their business so much better than I do, suppose you send to them and ask them.

Senator HEFLIN. You think they do want the price of fertilizer cut in half? Don't you suppose that has some influence on them.

Mr. WORTHINGTON. Well, Senator, as I am here giving facts in support of Mr. Ford's offer, I don't think I would like to criticize any of these people about anything.

Senator HEFLIN. You just want your proposition to stand on its own bottom. Mr. WORTHINGTON. If it can not stand up and be counted, why, it will have to be counted down, I suppose.

Senator HEFLIN. Some one asked you why you thought we ought to make an exception in this case in granting Mr. Ford this hundred year lease. I did not catch your answer.

Mr. WORTHINGTON. First, the magnitude of the undertaking, the very large investment he must make in order to work this proposition out, and in order to be able to pay the United States 4 per cent on the cost of these dams, I think he is entitled to it. And then again there is another thing. I can not at all agree that the 50 years in your present power act is a correct period of time. I think you compromised between the different contending views on the subject and you struck on 50 years. I think you will find that Canada now is probably making engagements as long as 99 years.

The CHAIRMAN. She has probably a larger governmental control than we have, however.

Mr. WORTHINGTON. In that connection, I would like to detain the committee, if I may.

Senator HEFLIN. Before you get away from that, don't you feel also that because Mr. Ford is going to manufacture fertilizers on a large scale, and be able to supply fertilizers in abundance to the farmers of the country at a low price, that should be an inducement on the part of the Government to make an exception in this case and to get away from the old rule?

Mr. WORTHINGTON. I think so, and I think the reason the exception should be made is that it is an exceptional case. It is not on all fours with others.

The CHAIRMAN. Well, while you are on that, just tell the committee wherein this proposition provides that you will make fertilizer so much cheaper than anybody else makes it and wherein it provides that Mr. Ford shall make the large investment that you say he will have to make. I would like to have it pointed out.

Mr. WORTHINGTON. In regard to Mr. Ford's investment there, I should like to suggest—I am not speaking for him or committing him in any way. I am not authorized to do so—in my associations with Mr. Ford I have concluded that perhaps he feels that he will have to spend as much money as the United States is going to spend. How he can ever work it out without a very large expenditure I don't know, but I would feel, if I were sitting on a board of directors and passing on Mr. Ford's offer, I would have to concede that as he is entering into a new field of investment and discovery, I would leave it to him for the reason that if he fails, if the power is as valuable for the United States to own and run you will not have lost it.

The CHAIRMAN. Now, that is the idea. In this proposition we have left up to him practically as to how much he shall spend, how cheaply he will be able to make fertilizer, and, to a great extent, how much he will be able to make. The only thing I object to is that we may leave it all to him for 75, 80, or 90 years after he is dead, and if we are going to do that we ought to put it into the contract as to the production of fertilizer cheaper, and as to the amount of the investment, and so on. If you depend on him, which you do, practically, then you ought to limit the proposition to his lifetime, and the next man who comes along, we will see whether he is as good a man as Mr. Ford before we trust him, and if we can not trust him we will not give it to him, but will look for some one else. There will be others, I suppose, after he is dead.

Mr. WORTHINGTON. Well, they don't grow on the limbs of trees.

The CHAIRMAN. Well, they don't; but he is not the only man in the country that is good, although he may be one of the best of them.

Mr. WORTHINGTON. If it had not been for him, Mr. Chairman, the poor man would never have seen an automobile for \$350.

The CHAIRMAN. I think that is right. Senator, although they are not cheap enough for me to buy, even a Ford. On the other hand, while I would not charge this up against Mr. Ford, since he kept the price down, and I think is entitled to a lot of credit, I sometimes wonder whether he did not do a great deal of damage to humanity when he got them all to buying Fords and other cars. I just wonder if the price of cars was up beyond the reach of anybody.

but millionaires, whether we would not be better off than to have everybody going in debt to buy a car?

Mr. WORTHINGTON. The people of this country don't want to be saved from the damage that Mr. Ford will do them at Muscle Shoals. You may protect him against his development of Muscle Shoals, but, nevertheless, I believe this is one time they don't want to be saved.

Senator HEFLIN. The Fertilizer Trust does not want him in competition with them.

Mr. WORTHINGTON. I should say in regard to the production of fertilizer, I am not going into a lengthy discussion of that, because I don't think we would ever accomplish anything if we did, but if you will extend your kindness for just a moment, I would like to call your attention to one phase of this that has been misunderstood.

It has been suggested that Mr. Ford was trying to get this nitrate plant for a little or nothing, promised to make just a little fertilizer, and that he was going to run away with the rest of the power for his own selfish ends. Why, that is very foolish and it is a joke on us, too, in this country. Mr. Ford can get power across the river at Windsor, where he has a large plant already. Up to 1920, I believe, or up to 1917, say, Canada, while we were discussing this subject 10 years previous to that, had developed about a million horsepower, and we had developed none in our navigable streams, and then we find that Queenstown has a development of 600,000 horsepower, and that power from the power plant of the power commission of Ontario is going to Windsor. He can get power there and accomplish all of these evil purposes if he wants to, all of these subtle purposes of Mr. Ford to get Muscle Shoals to do these things so harmful to the welfare of the country, as some one has suggested, he could do right at home.

Senator NORRICK. I agree with you. I don't think—

Mr. WORTHINGTON (interposing). Let me read to the committee here an advertisement cut out of this morning's Washington Post, an offer of 3,500,000 of 8 per cent cumulative dividend stock with a 40 per cent bonus of common stock of the Aluminum Alloy Steel Corporation (Ltd.) They are going to establish a plant that they propose to have making alloy steels in Canada, and they are going to use power from the Ontario Power Co.'s developments.

Well, I don't know what you will do with Mr. Ford's offer, but surely we have come to the point when sensible national pride demands that we do something in this country. It was found wise, or President Taft decided it was wise, to veto the permit passed by Congress to build Lock 18, and the nitrogen-fixation industry instead of being established at Montgomery, Ala., as it would have been, went to Canada.

In the course of this advertisement it will be found that this company states that they have the cheapest raw materials, transportation facilities, that they have very cheap ore and very cheap coke, when, as a matter of fact, Mr. Chairman, the ore that will be supplied at this alloy steel plant, if it is established, right over in Canada, and not far from Detroit, will cost twice as much per unit as Mr. Ford can get ore for at Muscle Shoals, and the coke will be nearly half again as much. I hope you will agree with one thought, that we ought to make a start in this country to catch up with Canada before she gets too far ahead, and before we suffer any more national humiliation on account of our getting in a rut on this power question.

The CHAIRMAN. Right on that point, there was given to me during these hearings a report by some electrical engineers of this country who were selected to compare the privately owned power in the United States with the publicly owned power over in Canada.

Mr. WORTHINGTON. Mr. Murray's report?

The CHAIRMAN. Yes. I read considerable of it. It seems to me they started out with the proposition that they were going to prove that publicly owned power costs the most, and they proved it, and they were arguing that way all the way through, and if that be true, the thing to do is not for Canada to get ahead, because her power is so much more expensive than ours. It is Government controlled, and ours is privately controlled. They could come over here where these engineers argue they can get so much cheaper power. Therefore, your argument that Canada will get ahead of us must fail before this magnificent report of a lot of millionaire power producers here that selected these men to make that kind of a report.

Mr. WORTHINGTON. I have been talking about power development in the United States since 1910. As far as talk is concerned, I am ready to quit. I think it is time to do something.

The CHAIRMAN. According to this, we have done much better than they have in Canada, where the Government does it, but now you say we have to hurry up or Canada will get so far ahead of us we will never catch her.

Mr. WORTHINGTON. We have not been developing any.

The CHAIRMAN. I am not saying that we have. In fact I did not believe what these fellows said, and I am more convinced now since I have listened to you, as eminent an engineer as you are. You have convinced me that that report is no good.

Mr. WORTHINGTON. The Murray report?

The CHAIRMAN. But they were demonstrating or comparing private water-power development in the United States with Government development in Canada, and they demonstrated that it was cheaper over here because it was privately owned, and that Canada was way behind because it was Government owned.

Mr. WORTHINGTON. You have paid me a very fine compliment, Mr. Chairman, but I did not tell you I agreed with Mr. Murray's report.

The CHAIRMAN. It does not make any difference. I am glad that you do not. But you have been quoting from it somewhat.

Mr. WORTHINGTON. I am obliged to.

The CHAIRMAN. I think you have demonstrated what I believed to be true by reading this report itself, that it was intended to bring out just exactly what it did bring out; you have shown that over in Canada they are ahead of us in this water-power development.

Mr. WORTHINGTON. About 2,000,000 horsepower.

The CHAIRMAN. If that report showed anything, it showed the opposite.

Mr. WORTHINGTON. About 2,000,000 horsepower.

The CHAIRMAN. We are very much obliged to you, Mr. Worthington, for giving us a great deal of information.

The committee will take a recess until 2 o'clock.

(Whereupon, at 1 o'clock p. m. a recess was taken until 2 o'clock p. m.)

AFTER RECESS.

The committee reconvened at 2 o'clock p. m.

STATEMENT OF MR. J. W. WORTHINGTON—Resumed.

The CHAIRMAN. During the recess, Mr. Worthington, I have had my attention called to the fact that there is a municipally owned water power right down in that vicinity, at Athens. Do you happen to be familiar with that?

Mr. WORTHINGTON. I know that there is a municipal plant there.

The CHAIRMAN. They own the power. Do you know how much the power is?

Mr. WORTHINGTON. No, sir; I do not.

The CHAIRMAN. Nor at what they are able to supply the customers with light?

Mr. WORTHINGTON. I do not know. I know that they operate their own plant municipally in the town of Athens, but I do not know any of the details.

The CHAIRMAN. Do you know, Mr. Waldo?

Mr. WALDO. No, sir; I do not.

Mr. WORTHINGTON. I think we could get you any information you wish on that.

The CHAIRMAN. No; I don't think that is necessary. Of course, it is only indirectly that it bears upon the question that we have been discussing.

Mr. WORTHINGTON. Mr. Chairman, there is nothing that I care to consume your time with further. Of course, I am at your disposal. As suggested this morning, however, we thought we would add one other insertion on the subject of ammonia and its cost.

The CHAIRMAN. Yes.

Mr. WORTHINGTON. We think that further information on the subject will be interesting, and we will put that in with the other.

The CHAIRMAN. All right; give it to the reporter. Is there anything else that you have to say?

Mr. WORTHINGTON. No, sir.

FIVE-CENT AMMONIA COMPARED WITH NITRATE OF SODA AT PRESENT PRICES.

The United States normally imports about 500,000 tons of Chilean nitrate, containing 20 per cent or, in the total, 100,000 tons of ammonia.

The cost of this nitrate at port is about \$60 per ton, or 15 cents per pound of ammonia. It represents at this price a total outlay of \$30,000,000 annually.

Produce this at a cost of 5 cents per pound and there results a saving of 10 cents per pound, or \$200 per ton of ammonia, which on 100,000 tons of ammonia is an annual saving of \$20,000,000.

FIVE-CENT AMMONIA COMPARED WITH SULPHATE OF AMMONIA AT PRESENT PRICES.

A fair average estimate of the consumption of sulphate of ammonia in the United States is 300,000 tons annually, containing 24 per cent, or, in the total, 72,000 tons of ammonia.

This sells at \$2.80 per unit of ammonia, or 14 cents per pound of ammonia. If ammonia can be had for 5 cents per pound, the saving is 9 cents per pound, or \$180 per ton of ammonia, which on 72,000 tons of ammonia is an annual saving of \$12,960,000.

FIVE-CENT AMMONIA COMPARED WITH COTTONSEED MEAL AT PRESENT PRICES.

Buying cottonseed meal at \$35 per ton, with due allowance for its phosphoric acid and potash content, is buying ammonia at 20 cents per pound. If ammonia can be had for 5 cents per pound, the saving is 15 cents per pound of ammonia.

The United States uses 800,000 tons of cottonseed meal for fertilizer purposes. This meal contains about 8 per cent, or, in the total, 64,000 tons of ammonia.

A saving of 15 cents per pound, or \$300 per ton, on ammonia, which on 64,000 tons of ammonia amounts to an annual saving of \$19,200,000.

SUMMARY.

If ammonia could be had for 5 cents per pound in the following fertilizers, the annual saving to the country would be as follows:

500,000 tons nitrate of soda-----	\$20,000,000
300,000 tons sulphate of ammonia-----	12,960,000
800,000 tons cottonseed meal-----	19,200,000
Total-----	52,160,000

The CHAIRMAN. Are there any further representatives of Mr. Ford to be heard to-day?

Mr. WORTHINGTON. No, sir.

The CHAIRMAN. We will adjourn, then, until to-morrow at 10.30 o'clock.

Mr. WORTHINGTON. We will be subject to your demands, of course.

The CHAIRMAN. Yes.

To-morrow morning, at 10.30, we will have a representative of the Agricultural Department here.

(Whereupon, at 2.15 o'clock p. m., the committee adjourned until Saturday, May 6, 1922, at 10.30 o'clock a. m.)

MUSCLE SHOALS.

SATURDAY, MAY 6, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock, a. m., in the room of the Commerce Committee of the Senate, United States Capitol, Senator George W. Norris (presiding).

Present: Senators Norris (chairman), McKinley, Harreld, Kendrick, Harrison, and Heflin.

STATEMENT OF MR. J. W. WORTHINGTON—Resumed.

The CHAIRMAN. Mr. Worthington, when you were on the stand the other day, I omitted to ask you some questions, and that is the reason I have asked you to take the stand again.

Mr. WORTHINGTON. Yes, sir.

The CHAIRMAN. Mr. Worthington, the lease under the Ford proposition—

Mr. WORTHINGTON. What section is that, Senator?

The CHAIRMAN. I do not have the section in mind, but I think you need not refer to it.

Mr. WORTHINGTON. All right.

The CHAIRMAN. If you wait until I finish the question.

Mr. WORTHINGTON. All right.

The CHAIRMAN. The lease for 100 years commenced to run as to Dam No. 2 from the time the dam is completed?

Mr. WORTHINGTON. Yes; from the time the first 100,000 horsepower is ready.

The CHAIRMAN. And the lease of Dam No. 3 commenced to run from the time that dam is completed.

Mr. WORTHINGTON. Yes; from the time the first 80,000 horsepower is ready.

The CHAIRMAN. It is estimated that three years will elapse between the completion of Dam No. 2 and the completion of Dam No. 3.

Mr. WORTHINGTON. Well, I could not question that such an estimate has been made by some.

The CHAIRMAN. Well, if it is different, we will be glad to have your estimate.

Mr. WORTHINGTON. But that is not the plan that Mr. Ford has evolved.

The CHAIRMAN. It is not?

Mr. WORTHINGTON. Oh, no.

The CHAIRMAN. What is his plan?

Mr. WORTHINGTON. According to our discussion the plan is to go forward with that dam (No. 3), certainly, within a year's time and probably complete them both within a short time of each other.

Senator HARRISON. I understood Mr. Mayo to say a year and a half. I may be confused about that.

The CHAIRMAN. I think Mr. Mayo said that they would be able to complete Dam No. 2 with two years, or perhaps within a year and a half, as I remember his testimony. The point I wanted to bring out was that in Mr. Ford's offer the leases for the dams do not commence at the same time; but they each run for the same length of time. Would Mr. Ford be willing to modify his offer so that the leases would expire at the same time?

Mr. WORTHINGTON. And begin at the same time?

The CHAIRMAN. Begin at the same time and expire at the same time? That would mean that the lease on Dam No. 3 would have a little less than a

hundred years to run? In other words, it seemed to me that when these leases expire, at least in the interest of the Government, they ought to expire at the same time.

Mr. WORTHINGTON. That is a reasonable thing.

The CHAIRMAN. Otherwise there might be some great difficulties involved.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. On account of the fact that the leases would have a difference in time?

Mr. WORTHINGTON. Yes. Mr. Mayo is more expressly authorized to answer such a question, but I feel certain that your suggestion can be worked out. He is still in town and I will have him advise you to-day about it.

The CHAIRMAN. Well, you see the point I am getting at, Mr. Worthington?

Mr. WORTHINGTON. Oh, yes; I think you are right in your suggestion, that they ought to expire at the same time.

Mr. HARRISON. There might be a difference of at least three years.

Mr. WORTHINGTON. Yes.

Mr. HARRISON. Or a year and a half.

The CHAIRMAN. The plans of the Government engineers indicated that they expected that three years would elapse. In other words, they do not expect to finish Dam No. 3 until after they have finished Dam No. 2, so that they can use the machinery and equipment they have at Dam No. 2.

Mr. WORTHINGTON. Mr. Ford and Mr. Mayo have a different plan from that.

The CHAIRMAN. I understand they have.

Mr. WORTHINGTON. I see the point you make. I never thought of it before, but I am quite sure it is quite reasonable.

The CHAIRMAN. There might be conditions existing at the expiration of this lease that would make it extremely important; in other words, if the Government at that time wanted to lease to somebody else, or wanted to take it over, the fact that they could not get possession of one dam might mean very serious difficulty.

Mr. WORTHINGTON. I have every confidence that it could be arranged.

Senator HEFLIN. I think the Chairman's suggestion is a good one.

Senator HARRISON. The whole thing should expire at once.

Mr. WORTHINGTON. Oh, yes. I will confer with Mr. Mayo on that.

Senator HARRISON. Yes.

Mr. WORTHINGTON. And ask him to see you to-day.

The CHAIRMAN. There is another question that I want to ask you. Have you the offer there before you?

Mr. WORTHINGTON. Yes, sir.

The CHAIRMAN. It is amended paragraph 15.

Mr. WORTHINGTON. Yes, sir.

The CHAIRMAN. Originally paragraph 14.

Mr. WORTHINGTON. Yes, sir.

The CHAIRMAN. That is the agreement on the part of Mr. Ford to operate nitrate plant No. 2 at approximately its capacity.

Mr. WORTHINGTON. Yes, sir.

The CHAIRMAN. Did you hear the testimony of Mr. Hammitt?

Mr. WORTHINGTON. No, sir.

The CHAIRMAN. Did you read his testimony?

Mr. WORTHINGTON. No, sir. I heard some mention of it at our house, but I really do not know anything about it. May I ask what the point is?

The CHAIRMAN. I will read you this:

"The company agrees to operate nitrate plant No. 2, using the most economical source of power at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other commercial fertilizers (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum)." etc.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. It was Mr. Hammitt's opinion that the words in brackets there, as follows: "said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum," were misleading, that the term "ammonium nitrate" was not a proper way to express the capacity of the plant, and that it would not necessarily follow that in making fertilizers in times of peace we would get fertilizer equal to the capacity of the plant. That is the way I understood his testimony.

Mr. WORTHINGTON. Well, I did not hear his testimony, and I have not read it, but I would say that according to your version of it I should not agree with him.

The CHAIRMAN. Well, I am not saying that I agree with him, but it raised a doubt in my mind.

Mr. WORTHINGTON. All I could say is that there had to be some minimum expressed in making this offer, because if none had been one would have been asked for, of course. The most reasonable and logical expression of a minimum was the capacity of the plant as designed and operated.

The CHAIRMAN. I think the committee understood—I know I did, and nobody seemed to have any different opinion about it—that this language used was, in effect, a promise, an agreement, to operate the plant at approximately its capacity.

Mr. WORTHINGTON. Precisely, sir; no other intention.

The CHAIRMAN. Do you understand that to mean now that we would get a fertilizer for the farmer equal in amount to the capacity of that plant?

Mr. WORTHINGTON. Oh, indeed.

The CHAIRMAN. Mr. Hammitt, it seemed to me, conveyed the impression that even if he did comply with this proposition, to wit, to produce annually 110,000 tons of ammonium nitrate, it would not follow from that that we would have the equivalent of the fertilizer that could be made from 110,000 tons of ammonium nitrate.

Mr. WORTHINGTON. Or some other commercial fertilizer equivalent to that.

The CHAIRMAN. Yes.

Mr. WORTHINGTON. Why, undoubtedly; that is the very full intention of that proposal.

The CHAIRMAN. After we get that ammonium nitrate, what is necessary from that period on in order to get fertilizer, and is it an expensive proposition?

Mr. WORTHINGTON. Yes; it is expensive to go from—not ammonium nitrate, but it is to go from cyanamide to ammonium sulphate. I would like to see if I could clarify right here the trouble which has run all through these discussions, and that is this, that it does not mean that that plants' capacity will be applied to cyanamide. It does not necessarily mean at all that its capacity of 110,000 tons of ammonium nitrate will be the thing done. The members of this committee, those who were at the hearings in 1916, will recall that Mr. Washburn very clearly explained what would be done, and he himself, though the leading authority in this country, and as good as any in any country, on the subject, never claimed that the development there would be used to make cyanamide.

The CHAIRMAN. As distinguished from the ammonium nitrate, what is cyanamide?

Mr. WORTHINGTON. I have understood that Mr. Hammitt expressly warned this committee that there was no market for the capacity of this plant in cyanamide—well, I have not understood that anyone claimed that there was such a market or that anyone has represented that the plant would be run to its capacity in cyanamide production, and it is not known yet, as I think has been explained, and if it has not been explained here Major Burns can make it very clear, that there are some difficulties—physical difficulties—connected with ammonium nitrate that have to be solved before it ever proves a successful nitrogen fertilizer.

Am I not correct about that, Major Burns?

Major BURNS. Absolutely.

Mr. WORTHINGTON. That only furnishes an example of what this field of research offers—indeed, enforces—if you work out this problem of ammonia; but, Mr. Chairman, the production of phosphoric acid by electric-furnace processes has been established commercially and definitely. You only have to find, if you please, what is the cheapest process that will produce ammonia. If you can find a process that will produce ammonia for 5 cents a pound at the plants then you will have solved the fertilizer problem of this country.

With that statement I would like to ask you, Mr. Chairman, do I clarify it at all?

The CHAIRMAN. Well, I confess I am in some doubt about it yet. I might explain to you that it is the idea of the committee that in time of peace we want it possible—and, of course, we can not expect the impossible; if the scientific men say it is impossible we have to give it up—but our dream and our hope is that in time of peace this plant should be operated to its reasonable capacity in the production of a commercial fertilizer that can be used by the farmer. If any members of the committee have a different idea of what we are trying to reach I wish they would correct me now.

Senator KENDRICK. I have this additional idea, Mr. Chairman, although that is exactly my notion so far as it goes, that the primary purpose during times of peace is to supply the farmers with as cheap fertilizer as can be had, but there is behind it the secondary question of the necessity of keeping this plant going in order to be ready in case of war.

The CHAIRMAN. Oh, yes; we want that; but, Senator, as I understand it, we could keep the plant ready to be used in time of war, without running it during peace time at all.

Senator KENDRICK. I was going to add that you can not be ready unless the plant is running. When war comes—as we hope to-day will be as far off as possible—but whenever it does come, the only way to have the efficiency of that plant is to have the plant in operation.

The CHAIRMAN. Well, I hardly think that would be necessary.

Senator KENDRICK. Mr. Chairman, any plant begins to deteriorate in quality by standing still. That is the first thing.

The CHAIRMAN. Well, we will have to spend a good deal of money to keep it in good shape.

Senator KENDRICK. Yes; and the next thing is the continuous operation of the plant means that improved methods will be installed there as they develop.

The CHAIRMAN. Yes; I think so. We want to do that.

Now, Mr. Worthington, assuming that what we are trying to do is, in making a contract with anybody, we want to make a contract which will insure just as large production of fertilizer in time of peace as possible, without in any way interfering with the fundamental thing, which is more important, even, and that is that this plant should be ready at a moment's notice to produce explosives in time of war. It is Mr. Ford's offer, as expressed in this paragraph, that he is going to run that plant to its capacity in the production of fertilizer.

Mr. WORTHINGTON. It is. I think I can clarify this a little, and since Major Burns is here, I will say this: This plant was designed to produce cyanamide, to get ammonia to be oxidized to make nitric acid. Have I stated that correctly, Major?

Major BURNS. Yes. We had a further objective. So far you are all right, but we had a further objective.

Mr. WORTHINGTON. But I have stated it correctly as far as the ammonia is concerned?

Major BURNS. That is correct.

Mr. WORTHINGTON. That is what I want to establish.

Major BURNS. Yes.

Mr. WORTHINGTON. Now, suppose it is found and that it is insisted upon, and Major Burns will bear me out in the statement that there are those who insist that there are processes that will produce ammonia much cheaper than the cyanamide process; but if, upon research, on a commercial scale, it is found to be true then that the process would serve the military end of this plant in the production of cheaper ammonia just as well as the cyanamide process would serve it. Is that correct, Major?

Major BURNS. Absolutely.

Mr. WORTHINGTON. So that the whole thing that Mr. Ford is ready to accomplish is to find out a way of producing cheaper ammonia. Now, any ammonia produced there can go on in time of war to the military end in this plant, which is the end that seeks the nitric acid. Am I correct, sir?

Major BURNS. Well, I think the War Department would be satisfied if we were assured of an adequate supply of fixed nitrogen in one form or the other. They would be satisfied if it was even in the form of ammonia.

Mr. WORTHINGTON. Indeed, you would, if we produced ammonia by this Casale process. You would get it in the form of ammonium sulphate and you would be satisfied to use ammonium sulphate, just as much as you would to use cyanamide.

Major BURNS. Well, as I said before, if we were assured of an ample supply of fixed nitrogen in one form or another, we would be satisfied.

Mr. WORTHINGTON. Certainly.

Major BURNS. Because mechanical manipulation will allow you to change nitrogen from one form to various other forms.

Mr. WORTHINGTON. Precisely. So it would be entirely in step with your Ordnance Department and its wishes if we produced a very cheap ammonia for agricultural purposes that would serve at the same time for military ends.

The CHAIRMAN. Mr. Worthington, as I understand it, the 110,000 tons of ammonium nitrate mentioned in Mr. Ford's offer is the equivalent of 40,000 tons of nitrogen.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. Now, does the Ford offer intend to fix nitrogen to the limit of 40,000 tons of nitrogen?

Mr. WORTHINGTON. It does, by whatever fixation process it uses, and certainly no less than that.

The CHAIRMAN. That makes it clear.

Senator KENDRICK. Yes.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. Does the offer intend that the additional fertilizer materials, potash and phosphoric acid, will be purchased or produced with such nitrogen products, in order to make commercial fertilizer?

Mr. WORTHINGTON. Will you state that again?

The CHAIRMAN. Maybe I will make it a little plainer if I state it in a different way. We have found, now, that this offer intends to convey the idea that Mr. Ford binds himself to fix nitrogen to the equivalent of that contained in 40,000 tons of nitrogen or 110,000 tons of ammonium nitrate.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. When we have that we still do not have a commercial fertilizer.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. Now, does his offer bind him to add the additional materials, such as potash and phosphoric acid, so as to make the complete fertilizer, to the extent that a fertilizer may be made up by the 40,000 tons of nitrogen?

Mr. WORTHINGTON. I would not undertake to say whether he was actually bound to do so, but I will say that the language used would absolutely carry him to it, and that, more than that, it is Mr. Ford's intention and that of his engineers, to employ phosphoric acid, processes for producing phosphoric acid, and accomplishing exactly what you have stated.

The CHAIRMAN. Of course, I do not expect Mr. Ford to say that he would necessarily do it in this way; if there is any improvement we would expect him, of course, to utilize it and make it as cheap as possible.

Mr. WORTHINGTON. Yes; it is so indicated.

The CHAIRMAN. Yes; it is so indicated; but I think it is important to know, inasmuch as we are trying to have a commercial fertilizer—and we realize that when he has his 40,000 tons of nitrogen he still does not have a commercial fertilizer—whether Mr. Ford agrees that he will make a fertilizer, put in the other ingredients of phosphoric acid and potash, which are necessary to make a complete fertilizer, to the extent that 40,000 tons of nitrogen would go.

Mr. WORTHINGTON. I should so construe that.

The CHAIRMAN. Well, that is plain.

Mr. WORTHINGTON. And, moreover, we can add that it is backed up by the intention as submitted.

Senator KENDRICK. I just want to say, Mr. Chairman, that the question asked by you is entirely pertinent and important—to have the information which was given as to the attitude of Mr. Ford—but I do not, as one member of the committee, consider it is important that he should perfect the product in the form of fertilizer, for the reason that many other industries in the country find it profitable to take this chemical—

The CHAIRMAN (interposing). This nitrogen.

Senator KENDRICK (continuing). And manufacture fertilizer themselves, and they would no doubt be glad to have it.

The CHAIRMAN. But, Senator, you must remember that when we get nitrogen, while that is a part of the fertilizer that we are going to make down there at Muscle Shoals—

Senator KENDRICK (interposing). Yes.

The CHAIRMAN (continuing). You still have nothing that is any good for the farmer, unless you go ahead and perfect it and manufacture fertilizer. To do that, two things are necessary: You must have phosphorus and you must have potash.

Senator KENDRICK. Yes, Mr. Chairman.

The CHAIRMAN. I understand that those two additions, after you have the nitrogen, would cost a good deal of money. Would they not, Mr. Worthington?

Mr. WORTHINGTON. Oh, indeed. It is expected that they will; but, Mr. Chairman—

The CHAIRMAN. Now, if Mr. Ford is only bound to produce it—if he is not going to go any further than to say, "Here is your nitrogen, and somebody else can make the fertilizer"—he has not done what we want to accomplish.

Senator KENDRICK. Yes; but I want to say here, Mr. Chairman, that the nitrogen is the one element that enters into this which we must draw from only one source. It is the only element on which there is anything like a monopoly at this time. Both potash and phosphate are easily obtainable from a good many different sources.

The CHAIRMAN. Now, is that true, Senator?

Senator KENDRICK. Oh, yes.

The CHAIRMAN. Of potash?

Senator KENDRICK. Yes. Yes; we have enough potash in Wyoming, it is estimated, to furnish this Nation, according to the estimates of the Interior Department, for 180 years.

The CHAIRMAN. Senator, what form is that in?

Senator KENDRICK. It is potash; it is in lava rock.

The CHAIRMAN. Oh, yes.

Senator KENDRICK. Then, we have phosphate quarries that cover thousands of acres of land.

The CHAIRMAN. Would it not be a pretty expensive proposition to get that potash in shape to mix it with nitrogen and make a fertilizer?

Senator KENDRICK. They had already established a splendid manufacturing plant for potash on the banks of the Green River at the close of the war and would have proceeded to manufacture it at a fair profit but for the collapse in prices. They have a plant out near Cokeville, in western Wyoming, that is producing at this time the phosphates of double strength, as the witness on yesterday morning gave to the committee; so that we come back to the proposition that if we can get nitrates there will be an unnumbered lot of industries that will manufacture the fertilizer commercially.

Mr. WORTHINGTON. May I add a word there, Mr. Chairman?

The CHAIRMAN. Yes.

Mr. WORTHINGTON. And, if possible, clarify the situation from the actual trade experience.

The CHAIRMAN. Yes; go ahead.

Mr. WORTHINGTON. It is not to be concluded that if you could solve the physical difficulties of ammonium nitrates, that some of that would not go directly to the farmer, because sodium nitrate goes as a top dressing; but as to phosphate the greater part of the tonnage consumed in the United States is mixed, as you suggest. A considerable tonnage of nitrate is used in that way, and I might make that very clear before your committee by calling your attention again to the use of cottonseed meal, which has just a shade of phosphoric acid, and it is used for its nitrogenous fertilizer value. So it is a factor, Mr. Chairman, that nitrogen fertilizer is used as such, but not to the extent, by any means, as the mixed goods, as it is called, that you have just discussed. I might say it is not the purpose here to have you conclude at all, either that this ammonium nitrate, using it as an example, if its difficulties might be solved, with some other form of nitrogen, produced from that, could be used. It does not mean that that is going to market to meet the intentions of the contract. That is not what it means.

The CHAIRMAN. I would like to ask you this question, Major Burns:

One of the terms used in Mr. Ford's offer, Major, is that "ammonium nitrate." Is there anything about that term that would be misleading to one trying to understand this proposition? Could you technically comply with it and make ammonium nitrate and still be a good way from fertilizer?

Major BURNS. Oh, yes; you could only have one of the ingredients of the fertilizer.

The CHAIRMAN. Is it not in such form that it would be ready to mix with potash?

Major BURNS. No, sir; ammonium nitrate, as it stands to-day is not accepted as a good fertilizer material. It has a plant food value, but it has physical characteristics which prevent its being put into mixed fertilizer.

The CHAIRMAN. What would you convert it into if you had to make the fertilizer?

Major BURNS. Well, we would not make the ammonium nitrate.

The CHAIRMAN. You would not?

Major BURNS. We would define our fixed nitrogen in the form of ammonia or some other material, probably ammonium phosphate.

The CHAIRMAN. In making ammonium nitrate you first get nitrogen?

Major BURNS. Yes.

Mr. WORTHINGTON. You first get cyanamide.

Major BURNS. Oh, yes; by that process, No. 2.

The CHAIRMAN. You would get nitrogen?

Major BURNS. Fixed nitrogen.

The CHAIRMAN. What is the difference between nitrogen and fixed nitrogen?

Major BURNS. The air is full of it, and we are breathing it every minute, but we can not use it.

The CHAIRMAN. Well, we would not get along very well without it.

Major BURNS. Fixed nitrogen is really the welding of the nitrogen of the air to some other nitrogen.

Mr. WORTHINGTON. To carry it.

The CHAIRMAN. Now, what do you weld it to?

Major BURNS. In the case of ammonia we weld it to nitrogen. In the case of nitric acid, in the arc process, you weld it to the arc of the air.

Mr. WORTHINGTON. And in the cyanamide process you weld it to the carbide?

Major BURNS. In the cyanamide process we weld it to the carbide.

The CHAIRMAN. After you have ammonium nitrate, is it an expensive proposition to make commercial fertilizer?

Major BURNS. Yes, sir; it would be, because you would have to get the other materials—potash and phosphoric acid—in order to make commercial fertilizer.

The CHAIRMAN. Take, for instance, the potash that is contained in the lava beds of Wyoming. Is that in such condition that it is practicable to use it for the making of fertilizer?

Major BURNS. I think it is perfectly practicable; yes, sir. But, of course, it all depends upon the economic situation to-day. To-day we are practically importing every bit of potash that we use from Alsace-Lorraine or Germany.

The CHAIRMAN. Taking the market to-day, would it cost less if you were going to use it at Muscle Shoals, with the nitrate that you would get there? Would it cost less to use potash from Germany or France than it would to get it out of the rock in Wyoming?

Major BURNS. I can only give you my judgment on that, Senator, and it ought to be backed up by somebody that knows more about it than I do, but, in my judgment, you could get potash cheaper from Germany or Alsace-Lorraine than you could get it from the rocks of Wyoming.

Senator KENDRICK. Or from the lakes of Nebraska.

Major BURNS. Yes. There is that Searles Lake potash proposition, you understand, of course.

The CHAIRMAN. That potash in Searles Lake is in a very condensed form, as I understand it.

Major BURNS. Yes; and even that can not compete with the imported potash.

Senator KENDRICK. There are some great manufacturing plants in western Nebraska, the chairman's own State, which were in operation all during the war, or nearly all of that time, but I think they are now all closed down.

The CHAIRMAN. Yes.

Senator HARRISON. That is purely on account of freight rates, I imagine, is it not?

Major BURNS. And labor, of course. The German potash deposits and the Alsatian deposits are the best in the world. They are the most concentrated and the most easily extracted and therefore they always have an advantage over the American potash deposits. As you know, during the war, the country was very much worried about potash, and did everything it could to develop the potash industry. I think it wasted material in the Searles Lake development, which was the biggest one undertaken during the war.

The CHAIRMAN. Yes. Of course, when the war was over, these various places where they had been developing potash could not sustain themselves on a commercial basis, and they never would have opened it, probably, except as a war proposition.

Major BURNS. That is it. Another potash development during the war was the kelp-weed plant down at Coronado, Calif., or in that neighborhood.

The CHAIRMAN. Yes.

Major BURNS. As San Diego, Calif.

The CHAIRMAN. Now, Senator, you were going to ask a question?

Senator KENDRICK. I want to ask a question with reference to this product that was used in carrying the nitrates through the process like coke. Is that product destroyed in the manufacturing process and lost?

Major BURNS. Yes, sir.

Senator KENDRICK. It is?

Major BURNS. With the cyanamide process it is lost. You have various raw materials going into—

Senator KENDRICK. Of course, the lime rock is a part of it.

Major BURNS. That is lost.

Senator KENDRICK. But the loss of that would not be material; but I was wondering if the coke had to be entirely destroyed in the process?

Major BURNS. Yes, sir; that is lost.

Senator KENDRICK. It represents an enormous cost, does it not?

Major BURNS. I can give you that. In a ton of ammonia the coke cost is \$13.02 and the limestone cost is \$8.81, out of a total cost of \$134 per ton.

The CHAIRMAN. Now, taking a ton of commercial fertilizer, how much is the phosphorus cost and how much is the potash cost?

Major BURNS. You will remember, Mr. Chairman, that you asked that question of Doctor Whitney yesterday, as to what he thought the total fertilizer bill in the United States was, and he said that during the year 1919 it was about \$225,000,000, and you asked him what part of that was chargeable to nitrogen.

The CHAIRMAN. Yes.

Major BURNS. And what part to potash.

The CHAIRMAN. And he did not tell me.

Major BURNS. He said he would give you the figures, and he has not done it. I can give you a very rough summary.

The CHAIRMAN. Well, give us that.

Major BURNS. Which you can check up.

The CHAIRMAN. All right.

Major BURNS. He stated that the normal consumption of fertilizer was 8,000,000 tons per year, and that the average nitrogen content of that is 3 per cent. In other words, it is 240,000 tons. Nitrogen to-day is worth approximately \$300 per ton. So 300 times 240,000 would be \$72,000,000. Now, if you take fertilizer as worth \$30 a ton and the normal consumption is 8,000,000 tons, your fertilizer bill is approximately \$240,000,000.

Senator KENDRICK. Or one-third of it.

Major BURNS. So that your nitrogen bill would be seventy-two two hundred and fortieths.

Senator KENDRICK. Or a little over a third.

Major BURNS. Or a little more than a third.

Senator KENDRICK. It would represent about one-third of the cost.

Major BURNS. A little less than one-third of the cost.

The CHAIRMAN. Would the other two-thirds be divided between potash and phosphorus?

Major BURNS. I can not answer that question. I do not know what these costs are.

The CHAIRMAN. Can you tell, Mr. Worthington? Have you any information on that subject?

Mr. WORTHINGTON. I think it was in 1916 that the answer to that question was put into the record before this committee, and I can only give you my best memory on it. I think the fertilizer bill was estimated at from \$150,000,000 to \$175,000,000, and that the nitrogen part of the bill was about \$80,000,000, the phosphoric acid part of the bill about \$40,000,000 and the potash part of the bill about \$30,000,000. Of course, I would like to reserve the right to correct those figures.

The CHAIRMAN. Certainly.

NOTE.—During the year 1914 there was expended for commercial fertilizer in the United States \$186,000,000, divided as follows:

For nitrogen.....	\$78, 000, 000
For phosphoric acid.....	65, 000, 000
For potash.....	43, 000, 000

Mr. WORTHINGTON. Because they were presented to the committee in 1916.

The CHAIRMAN. On account of illness, Mr. Worthington, I was not able to attend more than one or two of those hearings. They were exceedingly interesting.

Mr. WORTHINGTON. They were.

The CHAIRMAN. I always thought I would read them, but I have not been able to get to it yet.

Mr. WORTHINGTON. A great many of the questions, I notice, that you are asking, were answered then, and very intelligently, too. I am going to presume to suggest that by reading Mr. Bower's testimony in 1920, before your committee, and especially his testimony before the Military Committee a short time since, and by having him come before this committee all of this discussion of this morning will be made perfectly clear. As to this whole mixing question, I think he states the case with greater clearness than I have ever read anywhere else.

There is a part of the nitrogen fertilizer of the country that is, of course, used directly. For instance, ammonium sulphate is used in sugar cane growing directly. Ammonium sulphate is used on the orchards also.

The CHAIRMAN. As a spray?

Mr. WORTHINGTON. No; as a fertilizer.

The CHAIRMAN. As a fertilizer?

Mr. WORTHINGTON. You use it yourself, do you not?

Mr. SILVER. Yes; carload after carload is used in my home county annually on orchards, just ammonium sulphate.

Mr. WORTHINGTON. And if I may press the point, the problem is to get this ammonia down.

The CHAIRMAN. Now, Senator Kendrick, you wanted to ask Mr. Worthington a question when I interrupted you.

Senator KENDRICK. I believe it was very well covered by the answer of Major Burns.

The CHAIRMAN. All right. Now, Mr. Worthington, there is another question that I want to ask you. This proposition of Mr. Ford's that I have read says that the company which he organizes agrees to operate the plant at approximately the present annual capacity of its machinery and equipment, "in the production of nitrogen and other commercial fertilizers."

Mr. WORTHINGTON. Yes.

The CHAIRMAN. If I understand his offer—and I think I do now fully—I think the word "other" ought to be stricken out. I think it has a misleading effect. Nitrogen is not a fertilizer.

Mr. WORTHINGTON. It is, Mr. Chairman.

The CHAIRMAN. It is one of the ingredients.

Mr. WORTHINGTON. Yes; and it is used as a fertilizer itself.

The CHAIRMAN. Is it a commercial fertilizer?

Mr. WORTHINGTON. Yes, sir.

The CHAIRMAN. Is that right, Major?

Major BURNS. I think it all depends upon the point of view. It is not a rounded out commercial fertilizer.

Mr. WORTHINGTON. Yes; when it is used like Mr. Silver does on his orchard, it is a fertilizer.

The CHAIRMAN. Do you use the pure nitrogen?

Mr. WORTHINGTON. He uses the ammonium sulphate, which has as much as 24 per cent of ammonia in it, and the Chilean nitrate has the equivalent of about 16 and 17.

The CHAIRMAN. You are not using nitrogen when you do that.

Mr. WORTHINGTON. No; but it goes to the plant in the form of ammonia.

The CHAIRMAN. It may go to the plant that way.

Mr. WORTHINGTON. But you do not do anything more than take the nitrogen as it comes to you.

The CHAIRMAN. Exactly.

Mr. WORTHINGTON. That is what you get from Chile.

The CHAIRMAN. Is that pure nitrogen?

Mr. WORTHINGTON. Oh, by no means. You can not produce that.

The CHAIRMAN. All right. What I am objecting to in this contract is that it says that nitrogen is a commercial fertilizer. Now, you say it is, and to prove it, you say that the potash or the stuff that we get from Chile, just as it comes, is not nitrogen, and there is no proof at all, then.

Mr. WORTHINGTON. I would like to make a suggestion to you right there.

The CHAIRMAN. All right.

Mr. WORTHINGTON. It says in the production of nitrogen and other fertilizer compounds, and nitrogen is a fertilizer compound.

The CHAIRMAN. No, Mr. Worthington; you have that wrong. You have quoted it as it was originally made, but that has been amended twice. The word "compounds" is stricken out by Mr. Ford in his amended offer.

Mr. WORTHINGTON. I stand corrected.

The CHAIRMAN. And before the word "fertilizers" Mr. Ford has inserted the word "commercial," so it now reads, "in the production of nitrogen and other commercial fertilizers." That is the way it reads now.

Mr. WORTHINGTON. I stand corrected, and ask the opportunity to discuss that situation with Mr. Mayo.

The CHAIRMAN. I wish you would.

Mr. WORTHINGTON. At present, I think you are right.

Senator HARRELD. Here is what might happen and what I am afraid of. If you put the word "compound" in there it would be all right.

The CHAIRMAN. No; the word "compound" is stricken out. The idea in this amended proposition was to get a practical proposition, which is a commercial fertilizer. That is what we are after.

Mr. WORTHINGTON. Similar to a fertilizer we can use.

The CHAIRMAN. Well, a commercial fertilizer is one we can use.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. Before it was "commercial compound"? In carrying out the idea that Mr. Ford had when he struck out the word "compounds" and inserted the word "commercial," he changed the word from the singular "fertilizer" to the plural "fertilizers." That is just what he did. He carried that out, and that is the idea we want to carry out. That word there ought to be stricken out, I think.

Mr. WORTHINGTON. I will discuss it with Mr. Mayo at once.

The CHAIRMAN. All right. Now, there is another proposition that I want to talk to you about. It is in the same paragraph. He agrees to do all of these things that we have mentioned, but here is the exception to it. I will quote this: "Except as it may be prevented by strikes, accidents, fires or other causes beyond its control, and further agrees"—

Personally, I do not agree with some of the critics who have criticized that language, and if it had not been criticized and my attention called to it, I do not know that I would have been asking you these questions; but if there is any possible doubt about that it ought to be clarified. Why would not Mr. Ford be properly protected, without any danger of the Government being injured, if that exception were confined to acts of God?

Mr. WORTHINGTON. Your suggestion has been discussed rather extensively; and, while I am not sure about it, I believe the result of the discussion on the House side is that, after a thorough discussion, it seems that it is satisfactory and that your first impression is correct. On that point I will ask Mr. Mayo's attention for the committee.

The CHAIRMAN. My idea, Mr. Worthington—and that is the reason I am calling attention to it—is that this clause, in my judgment, is the most important one in the whole contract, because this is what Mr. Ford agrees to do, or, should I say, what the corporation agrees to do. No one would think for a moment, of course, that if Mr. Ford were operating that corporation that he would intentionally bring on a strike or that he would arrange things so that there would be an accident or even a fire, or anything else beyond his control; but he is going to die in a few years, and the corporation is to run it, and it will be just like any other corporation it will not have any soul nor conscience. It will take advantage of every technicality that it can wherever it can be benefited by it. An unconscionable person might, and I think it has happened in other cases that people who own property have purposely brought on a strike. They could do that easily if they wanted to. If this corporation sought to have a strike of its employees it could have one every month, and could get a new set of employees and have another strike, because it could make things so arbitrary and so inhuman that any bunch of men would strike.

Mr. WORTHINGTON. Mr. Chairman, I have often wondered, on hearing that phase of the case discussed, how on earth you could keep any corporation from doing that evil thing by any phraseology in the contract? I do not believe you can do that.

The CHAIRMAN. But it might relieve them from damages; you could make a contract so that if you had a strike it would not be any defense if you sued for damages.

Mr. WORTHINGTON. Well, in general answer to what you have said, I will take that up with Mr. Mayo right away and see if it can be made satisfactory, because it is his desire and that of Mr. Ford to make it so.

Senator HARRELD. Right there, I want to ask Mr. Worthington a question or two, if you please, Mr. Chairman.

The CHAIRMAN. All right, Senator, go ahead.

Senator HARRELD. I would like to see that language, if you have it there.

The CHAIRMAN. It is in paragraph 15.

Senator HARRELD. I want to call your attention to this part of the provision which says, "causes beyond its control." That raises a point that has been troubling me, and I want to get your opinion on it. We are giving a contract here for 100 years. I do not know whether I could make myself clear or not, but Mr. Ford agrees to produce fertilizers there, except when he is prevented by certain things, one of them being "causes beyond his control." Now, I will ask you this hypothetical question: Suppose, as the science of chemistry advances, some man invents a formula by which these nitrates could be made and patented so that Mr. Ford or his corporation can not obtain those patents and by the terms of the patent they can produce nitrates so cheaply that Mr. Ford can not produce them in his plant. Is that a matter that is beyond his control, and would that justify him in ceasing to try to manufacture nitrates and fertilizers, and would it excuse the company from any further operations along that line and leave it free to use its power for any other purposes for which it has a monopoly for 100 years? That is the objection that I have to this contract.

Mr. WORTHINGTON. Presupposing that the occasion should come about, and I am not indicating that he would try to get out of it; but would there be any use of his running that plant if the circumstances you have described occur?

Senator HARRELD. No; there would not be, but that is the very thing, that he has a monopoly for a hundred years without having to comply with the terms of this contract to produce fertilizer.

Mr. WORTHINGTON. And would not that be the greatest blessing the country could have?

Senator HARRELD. Not for his company to have that monopoly on that plant down there.

The CHAIRMAN. Now, if I may interrupt you there, gentlemen, it seems to me if that does happen we will all thank God. If it does, somebody will get a cheaper price.

Senator HARRELD. Yes.

The CHAIRMAN. But, on the other hand, as the Senator says, if the people will get fertilizer so much cheaper that Mr. Ford could not afford to make it there, we would not want him to make it; and instead of using this power to run that machinery he would have it donated to him.

Senator HARRELD. That is the point.

The CHAIRMAN. He would have donated to him 100,000 horsepower, which he would get free from the time that thing happened until the completion of a hundred years.

Senator HARRELD. That is the point; and he could use it for commercial purposes.

Mr. WORTHINGTON. Mr. Chairman and gentlemen, I had no intention of saying what I am about to say, but I am ready to meet the suggestion of the Senator and to defend this offer and insist that it is all right even if what he says may happen.

The CHAIRMAN. Let me finish the point I was starting to make.

Mr. WORTHINGTON. Yes; I thought you had finished.

The CHAIRMAN. No; I had not quite finished, and you really helped me by the suggestion you have made. The reason I am making the suggestion is this: It demonstrates, it seems to me, that it is a physical impossibility for the Government of the United States, on this uncertain proposition that we all hope and pray is going to be improved—it is a physical impossibility to make a contract with anybody that can properly contemplate the future. It is no disrespect to Mr. Ford or his company or anybody else that such a thing might happen, but that very thing is liable to happen. I do not know that it will, but that or something like it may happen; and there is no implication, even indirectly, of bad faith on the part of anybody.

Senator HARRELD. No.

The CHAIRMAN. It is something that has to develop in the course of nature, and it has seemed to me that something along the line of the bill that I have introduced ought to become the law, so that if such a thing does happen nobody will be hurt and nobody will get an undue advantage and the Government of the United States and the people who use the fertilizer will be protected.

Senator HARRELD. I want to say in that connection that I am not impugning Mr. Ford's motives. In fact, I would like to see the contract made, but you can see that if anything of that kind happens this company would have 80 or 90 or 100 years of cheap power and might use it commercially. That would give him an advantage commercially over everybody else that sought to make power. There is no other water power like that in the United States outside of the Canadian border.

Mr. WORTHINGTON. If the committee will be pleased to listen to me—

The CHAIRMAN. We would. We would be very glad to hear from you.

Mr. WORTHINGTON. I am sorry that I did not get to make my statement before the chairman made his, because his statement brings me under the embarrassment of a discussion of Government operation, and of course the committee knows I can not go into that with the chairman. He would use me up here in a minute, but just waiving that, and with all due respect, I want to impress upon you now what I regard as the economic fundamentals of this water-power question in this country, and I think it will be a full answer to the assumed possible occurrence that you are trying to guard against.

Of course you may say that you can protect the agricultural and industrial interests of this country better, cheaper, and more securely by Government operation than under this Ford proposal. As I say, I have to pass that by.

Now, let us come down to the practical thing.

It has been said that this proposal, if you accept it, will subsidize Mr. Ford, and you indicated it in terms by your question. I want you gentlemen, please, to take the trouble, in clearing up in your minds the very question that you have raised and look into what has happened in the Province of Ontario, Canada, in the last 15 years, and especially do I press upon you the Queenstown-Chippewa development just completed. You will find, I am sure, when you investigate the hydroelectric power-development service in the Province of Ontario that since the power commission of the Province was established, the head of which is Sir Adam Beck, they are using 4 per cent money.

Now, I want to ask you, Mr. Chairman and other members of the committee, how can you compete in this country with their water power? How can you expect to get the electric-furnace industry to grow in the United States if at the Queenstown-Chippewa development of about the same capacity at Dam No. 2 at Muscle Shoals power is developed with 4 per cent money any you let any private power company develop Dam No. 2 with 8 and 10 per cent money?

I do insist that this Canadian situation confronts you with one of two things, that you are compelled, in protection of agriculture and the industries of the United States, to provide 4 per cent money or you have got to go into it yourselves.

The CHAIRMAN. Now, Mr. Worthington, I agree with you.

Mr. WORTHINGTON. There is no escaping it. You may talk like we have for the last 15 years, and you may talk 15 years more, but you are nailed down to it.

The CHAIRMAN. And of course either in the way of a subsidy or directly, as the Government is about the only bunch of people in this country that can furnish 4 per cent money.

Will you let me again call your attention to this report that I mentioned the other day—

Mr. WORTHINGTON. Yes; indeed. I have been reading it.

The CHAIRMAN. In which they say that this governmental power concern controlled by Sir Adam Beck—that 's his name, is it not?

Mr. WORTHINGTON. Sir Adam Beck is the head of it.

The CHAIRMAN. Murray's report?

Mr. WORTHINGTON. Yes.

The CHAIRMAN. That report says that the power produced over there in Canada is selling at a higher price than our privately produced power in the United States, and that they are not competing with us at all. In other words he reaches the conclusion that the privately developed power here, where they have to use 8 per cent and 9 per cent money, as you say, is selling electricity to the consumer cheaper than they are doing it in Canada, where they get the 4 per cent money by virtue of Government operations.

Senator HARRISON. Is that just one Province up there or the General Government of Canada?

The CHAIRMAN. That is one Province. It is the Province of Ontario.

Mr. WORTHINGTON. The large water-power developments in Canada are in the Province of Ontario.

The CHAIRMAN. I am not saying that is not quite true. I have not investigated it. I am not saying that it is not true that they are producing power up there cheaper than we are producing it in America. In fact, the argument was made by this American Cyanamid Co. that it went to Canada because they could get cheaper power in Canada.

Senator HEFLIN. They really went to Canada because the President vetoed the dam act at Lock 18.

The CHAIRMAN. Yes; because the power was so cheap there.

Mr. WORTHINGTON. Mr. Chairman, suppose, if you please, that you waive Mr. Murray's statement, which I can not agree with, and let us face this as a general proposition, and let us inquire how it is that Canada, previous to the 10 years previous to 1920, say, developed and put into service in the Dominion about a million horsepower, and in that period we developed none in any navigable stream in this country with the possible exception, maybe, within that period of Lock 12 on the Coosa River. I am not certain about the year. Since that time, and in further contrast—and it is a humiliation to this country—you will remember that this Queenstown-Chippewa development was started in 1917, and that the order for starting the work on Dam No. 2 was in February, 1918. With all respect, I wish to say that this case that I am bringing to you now has confirmed the view I have entertained for a long time, that there is something the matter with our method of dealing with water-power development in the United States. I do not know what it is, but there is something wrong with us. Mr. Chairman, because there is that development started, as I remember, in 1917, with perhaps 150,000 horsepower, nearly ready for service, and the rest to be soon installed up to nearly 600,000. On the other hand, our development, the Government development at Dam No. 2—and this was a Government development in the Province of Ontario at Queenstown—we find that we have a development started about the same time that, according to the testimony of the Government engineers it is going to take three years to finish. Now, before that three years has passed the entire 600,000 at Queenstown will be serving those people, and the industries of Canada.

The CHAIRMAN. Is it not true that the kind of a dam you had to build there is a vastly different proposition?

Mr. WORTHINGTON. Oh, but if you will please go back into the reports of the engineers, they said it would be finished in three years. No, sir; I don't believe that while the design of the structures is different there is any appreciable difference in the difficulties that attend the completion.

The CHAIRMAN. I would not want to put my opinion against yours, of course, on a proposition of that kind, Mr. Worthington; but unless you are familiar with the kind of a dam they are building up there, I would not want to take your statement just as you have given it, because my impression is—I may be wrong, of course—that the dam that we are building, Dam No. 2, from the very nature of things, must take a great deal longer than the kind they had to make up there. In other words, this Dam No. 2 will be the largest concrete dam in the world when it is completed. That is one of the difficulties of damming the Tennessee River, the length of the dam.

Mr. WORTHINGTON. That is true. I could not hope by this discussion to-day to convince you on that point, but I am going to ask you to give me the opportunity to convince you that the two developments could be built in about the same time. If I do, I have made my point. If I do not, I have failed.

The CHAIRMAN. It would be interesting to hear you on the subject whether you could do it or not.

Mr. WORTHINGTON. The discussion of it here would not accomplish it, because it would still be a matter of opinion. But I can bring the facts to you. There is no question about it.

Now, then, just nailing this down a little nearer, at the hearing the other day I handed to the chairman an advertisement taken from the Washington Post of the day before, and raised in the minds of the committee the question why did this proposed electric steel alloy plant go in Canada at all, and if we do not in some way establish a policy that will develop larger water powers of the country that require so much capital, like Muscle Shoals, we are going to lose, as we have in the past, the electric furnace industry to Canada, because Canada is going forward with this cheap money that is criticized in this case as a subsidy. Whether it may be fairly called a subsidy or not, the fact remains that if they set down a subsidy in their water powers, we have got to meet them if we get the business.

The CHAIRMAN. Now, I want to ask you, Mr. Worthington—I think it will be illuminating—the difference in power development North and South, and I am asking entirely for information, because I think it will help to illuminate the subject.

One of the difficulties with every water power is the difference between the flow of the stream, its maximum and minimum flow, so that there is so much secondary power. Now, is it true that in the North, like in Canada, or in the northern part of our own country, where the flood is held back by reason of it existing in the form of snow and ice, and thus distributed over a longer period as it flows down the stream, making the flow more equal, while in the South, where there is no snow, it all comes down at once? Does that fact give an advantage to a northern stream over a southern stream, and give an advantage to Canada over the United States in water-power development?

Mr. WORTHINGTON. Unquestionably and obviously so. The Queenstown-Chippewa development is constant primary power, whereas in the streams of the South, which you refer to, every one of them has its low-flow season, and there is no way to get the maximum economic result unless you provide some way to fill in the low gap. Now, we have to install as we have, and as it is the practice to do at present, a steam auxiliary plant to do it. In the case, however, of a number of our streams in the South, the more permanent and economic thing to do is to go on the headwaters and establish reservoirs, which would control the flood flow of those streams during the rainy seasons, and then you would let the water come down the stream during the dry season to preserve the power as primary.

The CHAIRMAN. I suppose in the northern streams to-day there is some difficulty they do not have in the southern streams, in the way of handling the ice proposition. That makes some difficulty?

Mr. WORTHINGTON. It must be granted that power distributed in Canada has its hazards on account of cold weather.

Senator HARRELD. Mr. Worthington, referring to my question, could there not be a provision put in this contract that in case any one of these exceptions mentioned which would release Mr. Ford from that part of his contract which obliges him to manufacture fertilizer—if any one of those causes for exception were to arise for a certain time, that the Government might protect itself against having the company released from that part of its obligation in some way where it could control this water power for commercial purposes? I don't know whether that is practicable or not; but that is the objection I have to this contract.

Mr. WORTHINGTON. Yes. I will reserve any answer. I had not thought of that phase of it. But of course I am not authorized to commit Mr. Ford and Mr. Mayo about it, but I will discuss that phase of it. I don't presently see how—

Senator HARRELD. Keep in mind, now, our purposes are these in letting this water power to any private institution: First, to get fertilizers in times of peace; and, second, to get nitrates for use in time of war; that if it were not for these reasons we would not be spending all this time trying to negotiate this thing.

Mr. WORTHINGTON. That is true.

Senator HARRELD. Now, if the condition arises which deprives the people of that right of contract, then we do not like to be left in the attitude of having a company with a monopoly on the power, which is the greatest power in the United States, which it may use, as it would under this contract, for commercial purposes. That is my objection—the main objection.

Mr. WORTHINGTON. I appreciate the point you raise. I will discuss it with Mr. Mayo and I hope you feel this way, that there is a disposition to try to meet your views, if possible. I know that is true, but I trust you will bear in mind that in some cases it is very difficult.

The CHAIRMAN. Of course, we have a difficult proposition ahead of us and we all concede that. I think it would be well, I think it could be easily done, and I don't see why Mr. Ford's representatives should object to it, to provide in the contract for a contingency that may happen, and that we all hope and pray will happen—that is, that some method will be discovered by which we can get nitrate from the air at a very much reduced cost. Perhaps it will be a method where power will cut very little figure.

Mr. WORTHINGTON. Yes; we hope so.

The CHAIRMAN. Yes; we hope so. If that should happen then we don't want Mr. Ford to be making fertilizer down there at a loss, and he doesn't want to

do it. On the other hand, if he does not have to make fertilizer he has got a whole lot of power that he ought to divide up with the Government—any profit there may be in it—because he has been relieved—for he has been relieved from compliance with the only part of his contract that is difficult and that will cost him lots of money to comply with. Now, why could there not be a provision in the contract that would in substance provide that if some new invention were discovered, or if, let us say, the Agricultural Department should decide that it was no longer desirable and was not economy to use this plant to make fertilizers, thereupon the obligation of the company to operate the plant would cease, and the power that was thus released should be settled on some other basis.

Senator HEFLIN. In a case like that, Mr. Chairman, it might be that we might get in a Secretary of Agriculture who might be interested in the production of fertilizers himself, who might issue an order to put Ford out of business as a competitor.

The CHAIRMAN. That is very true. Senator, and of course we would want to provide that that could not be done. It might be well to say that it shall be done by act of Congress, or something of that kind. But it seems to me that there is a condition that I think is going to come. It may be that we will still want to use this plant and this power. If that is a fact, it won't make any difference. Everybody thinks that we are going to take this industry and revolutionize it as time goes on.

Mr. WORTHINGTON. Yes, sir.

The CHAIRMAN. We all believe that is going to happen. When that thing does happen we do not need to have a great big plant there, with \$90,000,000 invested as a war measure or as a peace proposition, either one, and we want to use it for something else.

Senator HEFLIN. But the crying need now is for cheaper fertilizer?

The CHAIRMAN. Yes, sir; that is right.

Senator HEFLIN. Mr. Ford's representatives come here and tell us that they believe that he can make it for half the cost that is put upon the farmer for it to-day, and everyone of these witnesses who opposed the Ford offer have laughed at the idea of reducing the price. Is not that so?

Senator HARRISON. I should imagine, Mr. Senator, of course, if there was a new patent on this proposition and Mr. Ford was operating that plant, he could enter into an agreement with them to use their new patent?

Senator HARRELD. Yes, sir; but, Senator Harrison, if Mr. Ford passed away, we will say, 20 years from now, it might suit the purposes of his successors to get released from the contract. They might welcome an opportunity to be released from this contract. Therefore, they would not try to make an effort to get the right to use this other patented process.

Senator HARRISON. There is no question about that. May I ask—I notice in your original proposition, that of July 8, that exception was not in?

Mr. WORTHINGTON. What exception?

Senator HARRISON. This exception that Senator Harreld has been speaking about here, "except as it may be prevented by strikes, accidents, fires, or other causes beyond its control."

Mr. WORTHINGTON. I think it was in.

Senator HARRISON. I looked through it here and I could not find it.

Senator HEFLIN. The point I was making, Mr. Chairman, was that these fertilizer people fear that Ford will reduce the price of fertilizer to the farmer, and that is why they are fighting him. Now, if we do accept his offer and he does reduce the price of it, and does so for a few years, the Government has done a great act in letting him have it, even if this other contingency should arise.

Senator HARRELD. Would it justify a hundred year monopoly on all that power down there, though?

Senator HEFLIN. That could be safeguarded in the contract. This is just a statement of what he offers to do. The Government has not had the contract written yet that he is going to enter into.

The CHAIRMAN. I have not said anything about this offer, or this belief, rather, that Mr. Ford is going to cut the price of fertilizer in half, because I know it is not in the contract, and nobody is bound by it. He hopes and thinks that they can cut it in two. But nobody has bound himself in any offer that he will do it, and nobody is going to bind himself that he will do it.

Mr. WORTHINGTON. No.

The CHAIRMAN. Because that is an uncertainty.

Mr. WORTHINGTON. That is to be established.

The CHAIRMAN. But I suppose it is proper to conclude that whatever hope there is in cutting down the price of fertilizer, especially in the use of this plant, is confined to cutting the cost of the method by which the nitrogen is extracted from the air, and that is only one part of a fertilizer.

Mr. WORTHINGTON. It is only one part, and the complete fertilizer has to be considered, and in reducing the cost of complete fertilizer at Muscle Shoals, surrounding economical conditions are found such as are found nowhere else for such a plant.

The CHAIRMAN. I think that is true.

Mr. WORTHINGTON. That all will go to make the ultimate mixture cost less.

The CHAIRMAN. Yes. Now, in reducing the cost of fertilizer it can be done in one of three ways, or in all three ways, or in two out of the three. One is to reduce the cost of nitrogen.

Mr. WORTHINGTON. Yes.

The CHAIRMAN. That is what this plant produces down there is nitrogen, and I suppose Mr. Mayo's idea of reducing the cost of fertilizer was that Mr. Ford would be able to improve the method by which nitrogen is taken out of the air.

Mr. WORTHINGTON. Yes, sir.

The CHAIRMAN. But you could reduce the price of fertilizer if you could cheapen the phosphate or the sulphuric acid part of it?

Mr. WORTHINGTON. If you could reduce the cost of the phosphoric acid by using electric-furnace methods, just as you produce nitrogen by electric-furnace methods, you could get finally the two components together, both reduced in cost, and, of course, the price per ton is reduced.

The CHAIRMAN. And then perhaps some other method discovered by which potash would be reduced, or a new supply of potash discovered?

Mr. WORTHINGTON. Certainly.

The CHAIRMAN. And if that should occur and the other two things should occur, you would be reducing the cost of fertilizer in three different directions.

Mr. WORTHINGTON. Certainly.

The CHAIRMAN. I suppose in considering Mr. Mayo's testimony we ought to consider that Senator Heflin gives it a great deal of weight, while I have not, because while he said that, he did not pretend to bind Mr. Ford that he would do that, and, of course, he would not undertake to bind him, but I suppose he was thinking then or had reference to the cheapening of the process by which nitrates would be taken from the air.

Senator HEFLIN. Mr. Chairman, he told the automobile makers that he would make cars that the common man could buy and they laughed at that, but he did it.

The CHAIRMAN. Well, he has not gotten quite down to where I can buy yet.

Senator HARRELD. You must remember that this fertilizer trust that you are talking of are working along this same line, to reduce the price of fertilizer.

Mr. WORTHINGTON. Where?

Senator HARRELD. Well, they will as soon as they have any competition. Now, you are aiming to give them competition. They will have to go to work and reduce prices, and they may be able to reduce the price so that you can not compete with them.

Mr. WORTHINGTON. The country gets the benefit of it.

Senator HARRELD. That is exactly what we want to assure, that the country will get the benefit of it.

Senator HARRISON. Let me ask you why was this exception left out of your original proposition?

Mr. WORTHINGTON. I don't know, Senator. I do not now recall the details, myself, since June of last year, but I will get you the answer.

Senator HARRISON. Of course, except by the act of God, that would eliminate the point that has been raised.

The CHAIRMAN. May be he is not willing to do that.

Mr. WORTHINGTON. Well, I will undertake to see. I would like to get before the members of the committee that went to nitrate plant No. 2 this suggestion. Assume, please, that we find a process for producing ammonia that would cut out your quarry, that would eliminate all of the limestone processing, that would make it unnecessary for you to have any coke processing—and as you went through those buildings just imagine that you could cut all that out.

The CHAIRMAN. And you would revolutionize it.

Mr. WORTHINGTON. Now you are going straight to ammonia, as I tried to get before the committee.

The CHAIRMAN. Yes.

Mr. WORTHINGTON. Now, what is in Ford's mind has something to do with this contract, and I have many times thought that in hearing just such a discussion as we have had here to-day, that you have got to take something on the faith of the future or you will never get anywhere with it, and I remember very well on June 14, when Mr. Ford was there, the question he first raised when he got there and went through the plant was, "What is all this for?" He says, "There is some way to cut this out, and it has got to be found."

The CHAIRMAN. Well, it seemed to me that way. I don't know that I hear any resemblance to Ford, but that is what I think and what I thought when I looked at it.

Mr. WORTHINGTON. That would seem to carry to your minds, you having seen the plant, just what is in his mind and what he will attempt. Now, no one here at this table would say that he ought to sign to do it, because he does not know yet.

The CHAIRMAN. Oh, no. Nobody could be expected to do it. But, now, speaking of the improvement that might be made, for instance, there is the Waco quarry, 26 miles away. We own a railroad from that quarry over to this plant, don't we?

Mr. WORTHINGTON. Oh, no.

Major BURNS. No.

The CHAIRMAN. Do we ship it over there?

Mr. WORTHINGTON. No. It is shipped over by the Southern Railroad.

Major BURNS. There is a spur there.

The CHAIRMAN. We own the spur?

Mr. WORTHINGTON. Yes.

The CHAIRMAN. I thought we owned the railroad.

Mr. WORTHINGTON. No; you just own the spur.

The CHAIRMAN. Well, it has to be done just the same, no matter who owns it, and we have to own the property over there, we have to quarry it, we have to crush it, we have to ship it, we have to unload it in its crushed form, and then we have to put it in the machinery, and we use 1,200 tons of it every day when we are running, and when we get through with it we throw it away. We don't use any of it. It is no good excepting as a conveyor to carry some chemical product to some other chemical product, and we have to go through an operation to put them together, and after we get them together and pass that along a ways, we have to go through another process to take them apart.

Mr. WORTHINGTON. That is the proposition down there, and there is the invitation for improvement.

The CHAIRMAN. That expense of converting that limestone, after you get it down there, 1,200 tons a day, into lime, that enormous machinery, covering acres of land, it passes through those great big revolving tubes, heated by electricity, all for the purpose of finding a conveyor of the chemical from one chemical to another, and then you have to go to the expense of separating it after you have got it together.

Mr. WORTHINGTON. The cyanamid process has been said to be the most wasteful mechanical operation that was ever discovered?

The CHAIRMAN. It seems to me it is. The funny thing to me always was whoever thought that by going through all that monkey business such a result could be obtained. I don't see how he conceived the idea, to begin with. If I were going to get nitrogen from the air I would not think of getting a lot of lime to carry it and convert it into something else.

Mr. WORTHINGTON. I think it is safe to say that Doctor Corey and Doctor Frank, in Germany, tried, but they couldn't.

Senator Harreld. I wanted to say this, that in view of what the chairman has so pointedly described, if Mr. Ford discovers a process for producing ammonia that will economically cure the evils which the chairman has just stated, and he does get a monopoly of the power, do you think the country would not have got, indeed, a fair return, in view of the fact that you have, as has been recently estimated, over 30,000,000 of horsepower in the United States undeveloped, and I just wondered if maybe your fears were not quite impractical?

Senator HARRELD. Oh, but, Mr. Worthington, let us eliminate Mr. Ford as a person.

Mr. WORTHINGTON. Yes; I am willing to do that.

Senator HARRELD. It may not be to the interest of that company to reduce the cost of fertilizer.

The CHAIRMAN. The fertilizer trust may own the corporation by that time.

Senator HARRELD. Yes; and maybe it will be to the interest to let fertilizer stay so high that some other fellow will make it cheaper than they can, so that they will be relieved, under these exceptions, from the terms of the contract.

Mr. WORTHINGTON. Yes; and that leads me to say quite frankly that I believe your very righteous desire to safeguard the future in connection with power legislation, in connection with this very power act that we have—well, I will have to say I think you overshot the mark, and you have failed to get what you were after, and I think I could show it to you, and I think your difficulty is of such a kind that you can not quite put a cylinder under it and hold it.

Senator HARRELD. You will agree with me that if this company did have designs of getting rid of this contract after they once entered into it, getting rid of that part which binds them to make fertilizer, the best way in the world for them to do it is to quit trying to reduce the price of fertilizer and let somebody else reduce it to a price where he could not compete.

Mr. WORTHINGTON. Yes; but, Senator Harreld, you bring that discussion into a field, you know, that I am not your equal. You are experienced in discussing just such questions as this and I am not. But there is just one thought I want to leave with you, and that is this, that if any such conditions as you have described ever does arise the people of Alabama and the people of the other States of this country will get the man by his business neck that undertakes it, and it is the history of this country in the past that the people have done it, and they are going to do it in the future.

Senator HARRELD. They have not been able to curb some of the monopolies.

Senator KENDRICK. They have not?

Senator HARRELD. You bet they have not. I think the Standard Oil Co. is bigger than the Government to-day.

I want to say this for Ford. I believe in good faith he intends to carry this out.

Senator KENDRICK. I want to ask whether we are proceeding to discuss each paragraph as we come to it, or whether we shall just ask Mr. Worthington any questions we may have in mind.

The CHAIRMAN. Oh, I am through with the questions I put him on the stand to ask.

Senator KENDRICK. I would like to ask Mr. Worthington as to the limitation of time on this lease. As one member of the committee I would object seriously to the length of time that has been named in this lease, because I agreed to the fullest extent with an expression of former Secretary of the Interior Lane, in which he said that he did not believe any of these leases on our natural resources—and that would mean our national resources—should extend over a period of 50 years, because, he said, "It is my conviction that the generation that comes after us ought to have a chance to pass upon these questions themselves. They may have different ideas about them from what we do."

So in all good faith and with an interest in Mr. Ford's proposition, and hoping that we may reach an understanding with him, I want to ask you if that time limit is final, if that question of time is a final proposition?

That question could be narrowed down, I think. My idea is, now, is Mr. Ford's proposition on that question of time in the form of a final conclusion about it, or final offer?

Mr. WORTHINGTON. Senator, I will have to answer that it is, but with this desire in answer, that if you would allow me to come to your office and bring some maps and information with me I think I can convince you as to this case that it is a case standing out by itself, and if you would allow me to do it, I would come.

Senator KENDRICK. I will say, Mr. Worthington, I should be very glad to discuss it with you, but I would think it only fair to you to say that you would have a difficult and uphill task to convince me that when we have now assumed to safeguard and conserve these great natural resources in the interest of the people, to deliver them over to anybody for a period of such a length of time that it means practically final, so far as we are concerned as a Nation, is the proper thing for us to do.

Mr. WORTHINGTON. Well, first, Senator, this Muscle Shoals road has been all uphill to me anyway, and you don't discourage me by that suggestion; but I want to add one thing. I want to raise one question in your mind. May it have been just possible that after all the nailing down of 50 years as the period under which you would allow these developments in the navigable streams to be made was a mistake. I would approach you that way.

Senator KENDRICK. That is all right. I answer the question in the spirit it was put. It is my opinion that it is safe to believe that 50 years, at the rate we are now moving, is too long, as it is that the period of time is too short.

The CHAIRMAN. In other words, Senator, you believe that 50 years is a maximum?

Senator KENDRICK. I do.

The CHAIRMAN. I agree with you. I think when we are going 50 years we are going an awful ways, and there has got to be something that makes it all out of the ordinary to put it even that way, it seems to me.

Senator KENDRICK. I am glad to have this opportunity to give expression in the record to my feeling about it. My attitude is a favorable one toward Mr. Ford, because of his record of doing things, and all the influences that he has brought to his home community. He would certainly be a helpful element in the development of that whole country. But we ought to, Mr. Ford ought to, and the men who are responsible in speaking for the Government ought to pass upon this question with the full recognition of the fact that we are all to be eliminated in a little while, and those that come after us are to benefit or are to be destroyed by the terms of this contract we write, and we ought to do it in a spirit of absolute foresight that can not be set aside for selfish reasons.

Mr. WORTHINGTON. Well, I think that no one would ever question the fairness of that statement on the one hand, and then if Mr. Ford felt that he could not undertake this within the period of fifty years, it is merely a question for the committee to decide what is the best interest of the Nation about it.

The CHAIRMAN. Yes. That is right.

Mr. WORTHINGTON. That is all you can do, and all he could expect you to do.

The CHAIRMAN. That is right, Mr. Worthington.

Mr. WORTHINGTON. One thing I would like to say—and always one sentence breeds another: There has nothing happened, I feel, Mr. Chairman, in the case of Keokuk, Hales Bar, Lock 12, or at any other dam built in any navigable stream in the United States, to support the fears or the dangers that you think may happen to the public interest in the future. I don't think there is one single thing that sustains it, and when it is true, and it will continue to be true, unless you change the Constitution of the United States or the constitutions of the States, the States themselves control the rates, why, I never have been able to understand how I could ever hesitate to let a man who would build a skyscraper for me and let him have 100 years or 150, if he let me make the rent rates.

The CHAIRMAN. But, Mr. Worthington, don't you know, in speaking of the State controlling rates, that under Mr. Ford's offer, if a contract was made carrying out that offer, it would not necessarily follow that anybody could control any of the rates down there at Muscle Shoals?

Mr. WORTHINGTON. He could not build that dam until he goes to Montgomery, before the utilities commission.

The CHAIRMAN. Exactly; but if he does nothing in the way of selling power, but simply manufactures something for himself, there is no such thing as controlling the rate there. It would not make any difference, in fact. In fact, if he does what I suspect from his representatives, he is going to do, build up a manufacturing establishment there and use, himself, the power, and not set it, the Alabama Power Commission or any other commission has nothing to do about rates.

Mr. WORTHINGTON. Quite true; but, if he works out the problem that you described this morning of cheaper ammonia and that is distributed over the United States, it will be a very much greater contribution to the economic welfare of this country than if he never sold a kilowatt in Alabama.

The CHAIRMAN. I agree with you. That would be a great contribution, indeed.

Senator KENDRICK. I agree to that also, Mr. Worthington, but listen just a moment to this statement, if you please:

Take your suggestion a moment ago that we might possibly one day find ourselves in the position of things that will enable us to junk all this paraphernalia and start in manufacturing nitrates on what would seem a simpler and more sensible plan, that would bring the price down so that anybody could proceed to manufacture them; that is, almost any great manufacturing concern. All right. Then we might find ourselves in the position of a very foolish group of men representing the Government who had bargained away for a trifle this great power plant for a hundred years. Now, whenever we look at

it from any angle, we see the necessity of proceeding here cautiously. I am actually prejudiced, not against Mr. Ford, but in his favor, but let me tell you, too, I am satisfied that this Nation would have been infinitely better off if we had proceeded in the way of development more slowly and more correctly than we have. I have always felt that way. Our development has been without compass and without chart in many ways. No one can now have an idea that we have been wise in our watered stock and that sort of thing, and in our railroad manipulation and building. It has been extremely unwise. It would have been better, according to my opinion, if it had not developed so fast, and had been along more sensible lines. So I think we ought to go slowly here.

Mr. WORTHINGTON. Well, Mr. Chairman, I think this, that every time we come to this great big question we are discussing here, we have to concede that you will have to take some risks, or that you have got to take up your policy, that is all there is to it. You have either got to let the Government go on and do all this and spend all the money, or you have got to take some human risks. There is no other way out.

Senator HEFLIN. It is a question of either accepting Mr. Ford's offer and taking a risk, or letting the project stand there like it has in the past.

Senator HARRELD. We could adopt a resolution today to accept Mr. Ford's offer, but that is not business.

Senator HEFLIN. Everything else he has had to do with has been business.

The CHAIRMAN. If you can guarantee that he will live a hundred years I will take a new view of the whole proposition.

Mr. WORTHINGTON. I hope, Mr. Chairman, that you will not forget that Mr. Ford sent in this proposition in June of last year.

Senator HARRELD. And he is entitled to an answer.

Mr. WORTHINGTON. And that whatever your decision is, please give him an answer as early as you can, because he can get power. He can get all the power he wants from the Queenstown-Chippewa Development, and that idea that he is trying to purloin a great power for his own use at Muscle Shoals appears to me as a wrong to him.

Senator HARRELD. Don't think I suggested that. I think he is entitled to an answer and is entitled to it soon.

STATEMENT OF MR. J. O. HAMMITT, VICE PRESIDENT AIR NITRATES CORPORATION, 511 FIFTH AVENUE, NEW YORK, N. Y.

Mr. HAMMITT. My name is J. O. Hammitt. I am vice-president of the Air Nitrates Corporation, which designed and built the Muscle Shoals nitrate plant.

Air Nitrates Corporation is a subsidiary of the American Cyanamid Co. and is entirely owned by the American Cyanamid Co., so of course the beneficiaries of any rights that Air Nitrates Corporation possesses are the stockholders of the American Cyanamid Co., and you can consider me as representing the American Cyanamid Co. as well as Air Nitrates Corporation.

I am very glad to appear before a committee some of whose members have seen the Muscle Shoals nitrate plant, because it is a little easier to justify a position of satisfaction which we feel in having put that property on the ground down there in the midst of four square miles of corn and cotton fields, without more than 20 or 25 habitable dwellings on the property, without any roads that were suitable even for automobile traffic, really suitable, and without any adequate means of bringing materials in, starting in the severest winter that had ever occurred in northern Alabama in the recollection of the oldest inhabitants, and having the plant actually in operation within nine months from the time the ground was broken. My purpose in asking an opportunity to appear before the committee is to request the committee to recognize the rights of Air Nitrates Corporation under its contract with the Government. I feel somewhat increased confidence by reason of the fact that the committee has actually seen the plant that we delivered to the Government and therefore must realize that we did actually perform, during the war, a service that was of some value.

The CHAIRMAN. You refer entirely to nitrate plant No. 2?

Mr. HAMMITT. I do; yes, sir.

The CHAIRMAN. You had nothing to do with nitrate plant No. 1?

Mr. HAMMITT. Nothing whatever, sir.

The CHAIRMAN. All right.

Mr. HAMMITT. Acceptance of the offer of Mr. Henry Ford for the acquisition by him of the nitrate plant and other property covered by his offer at

Muscle Shoals would be a violation of the solemn obligation of the Government to Air Nitrates Corporation contained in the contract under which that plant was designed and built. I wish to invite the committee's attention to the provisions of the contract that apply. That is the principal matter that I am anxious to call to the committee's attention. I have here some printed copies of that contract which I thought it might be convenient to the committee to examine, and may I pass those around?

Article 19 of this contract relates to "Sale of plants." That is on page 17, and it reads as follows:

"Sale of plants.—If upon cessation of this war or for any other reason the United States determines to cease the construction, equipment, or operation of any of the said plants and to dispose of the same, the agent shall be given the first opportunity (for a reasonable period of time, not to exceed six months after receipt of written notice stating the determination of the United States to dispose of the same and the material terms upon which such disposition will be made) to purchase the same, upon as favorable terms as the United States is willing to accept, before the United States shall sell the same to any other party."

The agent referred to in that paragraph is Air Nitrates Corporation, and the plants referred to in that paragraph include United States nitrate plant No. 2, at Muscle Shoals.

The CHAIRMAN. And what else?

Mr. HAMMITT. There were two other plants the construction of which was undertaken under this contract during the war, one located at Toledo, Ohio, and one at Cincinnati, Ohio. Neither of them was completed, and both of them have been scrapped.

The CHAIRMAN. Then, for all practical purposes, in considering this contract we can go on the theory that the only plant it applies to is nitrate plant No. 2.

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. That is the only reason I asked the question. I wanted to narrow it down.

Senator HEFLIN. You have no reference here to Gorgas plant at all?

Mr. HAMMITT. No, sir.

Mr. CHAIRMAN. As I understand you—your testimony and your contract and everything—the only interest you have in this hearing centers around nitrate plant No. 2 and nothing else. Is that right?

Mr. HAMMITT. That is not quite true, Senator, for this reason: Neither we nor no one else has made an offer to the Government for taking over and operating nitrate plant No. 2 without attaching to that offer some condition in the form of compensation for doing that thing. Mr. Ford's interests undoubtedly is primarily not in the nitrate plant but in the water power development. What he asks the government to do is to give him the cheapest water power on the American continent, made so cheap by reason of the fact that it is developed for him at Government expense and that he receives a lease for twice the period under which power developed at private expense can be leased or can be possessed without being subject to recapture, and on conditions by which the rental he pays for that property is a very low rate of interest on a portion of the money the Government has invested in it. That is the things that Mr. Ford would get of value to him out of his proposal, and he evidently considers that value so great that he is willing, in consideration of his receipt of that valuable thing, to make some kind of an effort, as described in his offer to operate the nitrate plant.

Now, if you cut the power end of his proposition out, he has no interest whatever in the nitrate plant. The reason he has no interest in it is the same reason that at the present time we are not prepared to make a proposal to the Government for its operation, namely, that you can not make anything at that nitrate plant now, even with cheap power, for which you could get more than approximately two-thirds of what it would cost you to make it. In other words, the operation of the nitrate plant in time of peace must be a losing operation. Mr. Ford, however, under his proposal, would receive from the United States compensation which he evidently considers is sufficient to make up all of his losses on the operation of the nitrate plant and still some more. That is the reason why we have an interest now in more than the nitrate plant itself, for we maintain that if the Government's best terms for the disposition of the nitrate plant are that they will give a water power to boot to anyone that takes it, then those are the terms which the Government must give us an opportunity to accept, under the provision of this contract.

Senator HEFLIN. What do you think is the value of plant No. 2?

Mr. HAMMITT. I think I should state that in three different ways, Senator?

I should say the replacement value of plant No. 2, first, would be roughly somewhere between one-half and three-fourths of what it cost to build that plant during the war.

I should say that the scrap value of the plant would be between 10 per cent and 15 per cent of what it cost to build that plant during the war—probably nearer to ten per cent.

Senator HEFLIN. Of the \$67,000,000?

Mr. HAMMITT. If you include the steam plant. Sixty-seven million dollars includes the steam plant.

The CHAIRMAN. I have gone on the assumption that both you and Mr. Ford have included the steam plant in connection with the nitrate plant.

Mr. HAMMITT. Yes, I am including it. I was just taking the \$67,000,000 figure.

Yes, including the steam plant—and, of course the portion of that plant which would have the greatest salvage value would be the steam power plant—that would have an exceedingly high salvage value, and there are some costly parts of the nitrate plant which would have an exceedingly low salvage value, but I should say ten per cent would be a fair salvage value for the entire nitrate plant No. 2.

The CHAIRMAN. That would be putting nitrate plant No. 2 at about \$6,700,000, then?

Mr. HAMMITT. Scrap value.

The CHAIRMAN. Scrap value.

Mr. HAMMITT. Including the quarry and steam plant.

The CHAIRMAN. That would not include Gorgas?

Mr. HAMMITT. No, sir.

The CHAIRMAN. That would not include the railroad, would it, or would it?

Mr. HAMMITT. No, sir.

The CHAIRMAN. It would not include anything down there at plant No. 2?

Mr. HAMMITT. Plant No. 1, you mean?

The CHAIRMAN. I mean plant No. 1.

Mr. HAMMITT. No, sir.

The CHAIRMAN. There is another steam plant that is to be added, is there not?

Mr. HAMMITT. Yes, sir; except that it is, of course, an uneconomical plant. I presume, because it is a very small one.

The CHAIRMAN. Of course it is small, but so far as its size is concerned it is just as modern as any other plant, is it not?

Mr. HAMMITT. I presume it is. I have not seen it Senator, but I presume it is. That, of course, does not include the transmission line which joins plant No. 1 and plant No. 2.

The CHAIRMAN. Now, then, I don't know that you intended to offer this testimony, but Senator Hefflin's question has started it, and I think we ought to finish it. It applies particularly to the testimony given by Mr. Mayo as to the value.

Even the scrap value, in your judgment, of the nitrate plants, both of them, and add to it the value of the Government's interest in Gorgas and the Government's ownership of the transmission line—even the scrap value would be. I judge from your testimony, between \$10,000,000 and \$15,000,000, would it not?

Mr. HAMMITT. I should think so; yes, sir. I am, of course, not quite so familiar with the remainder of that property as I am with the Muscle Shoals nitrate plant; but you have added so little for the remainder, and so large a percentage of the remainder is power-plant property, whose scrap value is exceedingly high, that I should think your estimate is modest.

The CHAIRMAN. Say \$15,000,000?

Mr. HAMMITT. I should think \$15,000,000 would be a modest estimate.

The CHAIRMAN. A modest estimate of the value?

Mr. HAMMITT. I should say probably a fair estimate of its scrap value.

Senator HEFLIN. You are proceeding there upon the theory that the man would buy it and take it away and do what he pleased with it?

Mr. HAMMITT. Exactly; yes, sir.

The CHAIRMAN. Yes; scrap value. In other words, scrap it.

Mr. HAMMITT. Now, as to the value of United States nitrate plant No. 2. Senator, with a condition attached to it that that nitrate plant must be used in its present condition, I should say that it would have no value whatever, because you can not use that plant in its present condition or with any modifications

that would materially alter the character of the plant, for the production of anything the production of which at that plant would net you otherwise than a loss. That really is a fundamental feature of that nitrate situation that I think has had a very important effect upon the character of the bids that the Government has received.

Now, if we had conceived that the Government's desire was to place that nitrate plant in operation under conditions by which the Government would give a subsidy in one form or another that would make up the losses and turn them into a profit, if that had been our conception of what the Government wished to have done with the plant, we might have come down to Washington and made an offer; but we never had that conception and we have been unable to make any suggestion to the Government as to the operation of that plant, because we assumed that the operation would have to carry itself.

Getting back to this provision of our contract—

The CHAIRMAN. I was going to ask a question in connection with getting back to it. Now, you have just said, practically, that this plant is not worth anything if it is to be operated in time of peace. Is not that the idea you want to convey?

Mr. HAMMITT. Unless the conditions of that operation are such that they earn for the operator a compensation from the Government in some other form.

The CHAIRMAN. Well, that is getting back to the same thing. Unless you have some subsidy or are paid something outside of turning the plant over, you would not take the plant and operate it to make fertilizer unless you were paid something for doing it, even though you got all you got out of it in the sale of fertilizer?

Mr. HAMMITT. Well, if we could get all that we put into it, we would be glad to undertake the operation; but neither we nor anybody else, Senator, would be prepared to take that nitrate plant and undertake to operate that nitrate plant as a fertilizer manufacturing proposition at the present time unless the Government paid them something in some form or other for doing it.

The CHAIRMAN. In addition to what you got out of the product that you made and sold?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. That is the very thing I wanted to bring out.

Mr. HEFLIN. If Mr. Ford's offer should be accepted and he should get it at what you consider a low figure, could he afford to manufacture fertilizer?

Mr. HAMMITT. I think it is entirely possible that Mr. Ford could afford to operate that plant providing you give him water power under the terms that are contained in his offer; but I have read that offer in all its successive stages with a very great deal of care, and I am quite convinced that Mr. Ford has not said anything in his offer that actually conflicts with what he told the Secretary of War regarding the fertilizer operation, namely, that he would not operate the plant for the manufacture of fertilizer unless it could be operated at a profit.

Senator HEFLIN. He claims that he wants to make only 8 per cent profit.

The CHAIRMAN. Don't you think his proposition binds him to operate it?

Mr. HAMMITT. I do not, no, sir; and I think that whatever may be the intention regarding the fertilizer operation you can not obtain it from the offer itself, because that is in itself utterly unworkable. You will have to obtain it from some other sources of information. It is not contained in the offer. So his offer, if you would be interested, Senator, in some analysis of that fertilizer proposition—

The CHAIRMAN. Of course, we are. We should be glad to have anybody analyze any of these offers.

Senator HEFLIN. I would like, before he gets away from this matter, to call attention to this. The offer of Mr. Ford, article 15, contains this:

"The company agrees to operate nitrate plant No. 2, using the most economical source of power at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other commercial fertilizers."

Don't you think that is stated quite specifically?

Mr. HAMMITT. You have not read it all, Senator. If you will read the rest of that paragraph—and of course you have it before you, so it is not necessary to read it—you will see that that capacity—

The CHAIRMAN. Just read it, so we will all get it.

Senator HEFLIN (reading):

"(Said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum), throughout the lease period, except as it may be prevented by strikes, accidents, fires or other causes beyond its control."

And so forth.

The CHAIRMAN. Is that all you want him to read?

Mr. HAMMITT. Yes sir.

The CHAIRMAN. Does not that bind Mr. Ford? Of course it is not a contract. It is an offer. But is not that an offer to enter into a contract to operate this plant to its capacity?

Mr. HAMMITT. I think not, Senator; and the first thing that strikes me in reading that section is the definite measure that is made of the capacity of the plant.

The CHAIRMAN. Is not that correct?

Mr. HAMMITT. Only if the entire plant is operated in the production of nitrogen. In other words, you can not measure the capacity of that plant to produce phosphoric acid in terms of ammonium nitrate, because there is no phosphoric acid in ammonium nitrate. Nor can you measure the capacity of that plant to produce potash in terms of ammonium nitrate, because there is no potash in ammonium nitrate. Now, you can—although I do not think the language is well designed for the purpose—measure the capacity of that plant to produce nitrogen in terms of ammonium nitrate if what you mean—as I assume this means—is the amount of nitrogen that would be contained in 110,000 tons of ammonium nitrate. But when we are dealing in business, Senator—we never do deal in business, as a matter of fact, with hundred year contracts—but when we are dealing with long-term contracts, and we seek to write a guarantee that will actually hold during the period of a long-term contract, we must get them very definite and very specific and very clear, because our experience is that they do not last during a long term contract unless they are clear. They must be painstakingly clear, and in order that this question of a guarantee should be made painstakingly clear, the first thing you would have to have would be a statement of what it is Mr. Ford's intention to do. We have had a number of different statements on that from Mr. Ford's representatives. We have had Mr. Ford's own statement that he will not make fertilizer unless he can make it at a profit. Then we have had the statement of Mr. Mayo before the House committee to the effect that what Mr. Ford proposed to make was the equivalent of 2,000,000 tons of 2-8-2 grade of fertilizer, and that he proposed to make that at Muscle Shoals.

Well, now, if that is what he proposes to make, and he is going to use this Muscle Shoals plant in that operation, he would have to use the entire plant and the approximately 100,000 horsepower that it calls for as a power requirement, in the manufacture of only one of the three ingredients that go into that fertilizer. Then he would have to produce or purchase the other two ingredients, and if he were to produce them instead of purchasing them he would have to provide the plant facilities and equipment necessary to produce them. If he were going to produce them by use of an electric-furnace method, he would have to have for his phosphoric acid alone, in all probability, twice as much power as the total power that would be used by the Muscle Shoals plant in making nitrogen.

The CHAIRMAN. That would be about 200,000 horsepower?

Mr. HAMMITT. I should say roughly it would probably come to 200,000 horsepower, if he were going to produce phosphoric acid by an electric-furnace method.

In addition to that he would have to produce his potash. He is not even sure of having available supplies of potash in that near neighborhood. Evidently his own ideas as to how he is to get that potash are somewhat indefinite.

But it is a very difficult thing, Senator, to write a definite guarantee until you start out with a definite or clear understanding of what it is that is going to be produced. Is it going to be 2,000,000 tons of 2-8-2 fertilizer, or their equivalent in other plant foods, or is it going to be simply the nitrogen content of a 2-8-2 fertilizer, or what is it going to be?

The CHAIRMAN. To make the complete fertilizer you would have to have all three.

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Of course, this plant is equipped to make only one of them?

Mr. HAMMITT. And not even equipped to make that at the present time in a form suitable for use in fertilizer.

The CHAIRMAN. No; I understand that.

Mr. HAMMITT. But you could use a considerable portion of that plant by adding other plant facilities to it.

The CHAIRMAN. To make the nitrogen part, now, of the fertilizer. I am interested to know whether your testimony agrees with what is before us. We have been given to understand that in amount perhaps about two-thirds of the plant now in existence, which was made, of course, for the manufacture of explosives, would be useful and would be used in the manufacture of nitrogen for fertilizer. Is that your idea?

Mr. HAMMITT. Speaking of it in value, it would be between one-half and two-thirds of the value. I think a little nearer to the half.

The CHAIRMAN. How much more machinery would have to be installed there, and what would it cost, in order to equip the plant for the manufacture of nitrogen to be used as a fertilizer ingredient? Of course, whether it be the Government or anybody else, whoever undertakes to make fertilizer, or to make the nitrogen that is to go into fertilizer, must, it is conceded, install enough machinery in addition to what is there now to do that thing. It is conceded that it can not be done just as it stands, because it was equipped to make nitrates for explosives only.

Senator HEFLIN. Mr. Chairman, I understood Major Burns to say when he exhibited some of the ingredients produced at Muscle Shoals Plant No. 2, that they were fit for use as fertilizer now.

The Chairman. Is that right, Major?

Major BURNS. It was never my intention to convey that idea, Senator.

The CHAIRMAN. I did not get that idea from the Major's testimony.

Major BURNS. We made the finished product, ammonium nitrate, which I said was a good plant food if it could be used to make fertilizer, but it picks up so much water that as a fertilizer, at the present time, it was not acceptable as a good fertilizer material. I said the easiest way to convert No. 2 plant to a fertilizer plant was to make ammonium sulphate out of your ammonia. Ammonium sulphate is a fertilizer material. We have apparatus for the manufacture of ammonium. We have not apparatus for the manufacture of ammonium sulphate. That additional plant would have to be installed.

Senator HEFLIN. But you do make some of the ingredients now?

Major BURNS. We make the ammonia, but the ammonia is not in shape to make fertilizer.

Senator HEFLIN. The kind you make there now is not fit for fertilizer?

Major BURNS. No, sir. It is good to be put in the form of ammonium sulphate, for the manufacture of fertilizer.

The CHAIRMAN. As I understand, in making nitrates out of the air you start in just the same whether you make fertilizer or explosives, and for a certain distance you work the same way, but there comes a time before you reach the fertilizer and before you reach the explosive, if you are going to make fertilizer you go one way and if you are going to make explosive you go the other. This plant is completely equipped up to the point where the two ways separate, but from that point on in order to make fertilizer you have to put in machinery to do it. Is that right?

Mr. HAMMITT. That is correct, Senator, and very clearly stated. If you were to produce your fertilizer in the form of ammonium sulphate, as Major Burns has just stated, would be the simplest manner of putting that ammonia into an available form for fertilizer use, your additional investment in plant and facilities would approximate three and one-third million dollars, assuming that you purchased your sulphuric acid instead of erecting a sulphuric acid plant to make it. The question whether you put up a sulphuric acid plant or buy your sulphuric acid would be simply the question of which would be the cheapest way to get the sulphuric acid.

Senator NORRICK. Going back to your interpretation of the Ford contract, I want to ask, it is your contention that if Mr. Ford undertook to make fertilizer and found that he could not get more than 7 per cent profit, he could then abandon the fertilizer entirely and use the power for other manufacturing purposes, entirely without any regard to the fertilizer question?

Mr. HAMMITT. I can not find out that anything very serious would happen to him if he disregarded this fertilizer-manufacturing provision of his contract entirely beyond actually making a start and discovering that the thing—

Senator NORRICK. If he made an honest effort to produce it and found that he could not make 8 per cent on the fertilizer, he could abandon the fertilizer part of it and use the power for other purposes under his contract? Is that your contention?

Mr. HAMMITT. I think there would be ways that he could accomplish that, Senator. But, frankly, my first difficulty about this fertilizer section is that

it does not state terms that have an actual meaning. That is, it attempts to measure fertilizer in terms of ammonium nitrate, and that is an impossible way of measuring it. It does not state definitely what the intention is behind the offer.

My second difficulty about it is that there is no provision for a bond which shall be liquidated damages in behalf of the Government in case of failure to comply with this provision of the contract, such as it has been always our experience in contracts of that character everybody is required to provide. Nor is there a provision that the rights of the company acquired on the strength of this so-called guaranty shall revert in case the guaranty is not carried out, and again be taken possession of by the Government. In other words, it seems to me in the first place there is not a definite enough statement of what the capacity is that we are talking about in order to be the basis of enforcing such a guaranty, and there are not the usual sanctions in the contract in order to see that the guaranty, if definitely made, is carried out.

Senator NORBECK. The contract is not with Mr. Ford himself, but is with a corporation to be formed?

Mr. HAMMITT. Yes, sir.

Senator NORBECK. Of a comparatively low capitalization.

Mr. HAMMITT. Of a capitalization of \$10,000,000.

Senator HEFLIN. Could not all those things be specifically set out in the contract that he will make if his offer is accepted?

Mr. HAMMITT. It would be perfectly possible, Senator, to draw a form of guaranty with adequate sanctions to require the manufacture of fertilizer at Muscle Shoals or anywhere else in the United States, but it is not drawn here, and you will find, all the way through, language like this: "Except as it may be prevented by strikes, accidents, fires, or other causes beyond its control."

The CHAIRMAN. There is only one clause there that would let him out, and that is "other causes beyond his control." Is that where you think the corporation could creep out?

Mr. HAMMITT. I think that is one very broad gateway out of which it might be possible to escape. I am not saying that I think there is any intention to escape, but I mean that this particular clause does not effectively accomplish the purpose which it has been said it was intended to accomplish.

Strikes, you know, Senator, are usually the result of difference between an employer and his employees. I can close up any property of the American Cyanamid Co. by a strike within two weeks if I set out with that definite purpose.

The CHAIRMAN. Yes; I suppose you could. But suppose you did it and you wanted to violate a contract by that means; do you think that the courts would permit you to do that. Suppose Mr. Ford or his company tried to get out on the fact that he had a strike and the evidence developed that the company brought the strike on purpose to get out. That would not be any defense as a matter of law, would it?

Mr. HAMMITT. Well, I am not a lawyer, Senator, but, of course, I have had some experience in the negotiation of contracts, and the only thing that impressed me was that whatever may be the intent, however definite may have been the intent to give assurance by this clause of a continuous manufacture of a fertilizer material, that intent is not successfully carried out. I think that one difficulty is that probably Mr. Ford does not know just exactly what it is he intends to do down there. The committee has heard testimony within the past two days of proposals to make fertilizer as a by-product of some other kind of an operation whose other products are mentioned as electric-furnace steel and aluminum. Now, if you have not got a definite program, or at least a definite program that you are willing should be disclosed to both parties in the outset, you will be in the very difficult position to write a definite and binding fertilizer guaranty. But if I may get back, if that serves your purpose, now, Senator—

The CHAIRMAN. Yes. All right.

Mr. HAMMITT. To the course of the testimony that I came here with the intention of presenting, I want the committee to have in mind the relations of the American Cyanamid Co. and the Government as they existed at the time that Air Nitrates Corporation, a subsidiary of the American Cyanamid Co., contracted with the Government to construct a nitrate plant at Muscle Shoals.

The American Cyanamid Co. expended a very great deal of effort and very substantial sums of money, running into millions of dollars, in the acquisition

of patents, the development of processes, the erection of plants, and the introduction into the American market of materials produced by those plants. Its operations had not been particularly profitable and they have not been specially profitable up to the present time. The company has succeeded in paying the 6 per cent cumulative dividends on its preferred stock with the exception of one quarterly payment. It has never paid a penny on its common stock. But it had these processes, it had these plants, it had a place already established at great effort and considerable expense in the American market, and it had a hope that the money that had been invested in these things might be taken out of these things ultimately with a profit.

That was the position of the American Cyanamid Co., and the most valuable thing it possessed was its knowledge and experience and processes.

The Government desired to tap a new source for nitrogen in order to eke out the necessary requirements for the conduct of the war. So the Government called upon the American Cyanamid Co. to construct a plant four times the size of the comparable plant of the American Cyanamid Co. and to operate that plant, using the processes which the American Cyanamid Co. had developed, and, of course, that plant had to be built for war purposes. If it had not been for the war needs of the Government it never would have been built. Yet it was stipulated that the plant should be built as a permanent plant, that it should be available at all times in the future, or for an indefinite period, for the manufacture of fertilizers and other products useful in times of peace. The American Cyanamid Co. requested, and the representatives of the Government agreed, that the company should have some kind of protection against that thing which it had provided for the Government during the war being used after the war for the destruction of the company which had provided it. When you consider that the largest amount of ammonia in a form produced by the cyanamid process that has ever been consumed on this side of the Atlantic Ocean by the entire fertilizer industry in any year represents not more than two-thirds of the capacity of our plant at Niagara Falls, Canada, and that the capacity of the Muscle Shoals plant is approximately four times the capacity of that Niagara plant, you may easily see what situation faced those in charge of the affairs of the American Cyanamid Co. in obtaining, while they rendered this service to the Government, protection for their stockholders against the use of the thing they provided for war purposes to destroy the investments of their stockholders. And so a certain form of protection was ultimately agreed upon which the representatives of the Government and of Air Nitrates Corporation and the American Cyanamid Co. all felt protected both the interests of the Government and the interests of the stockholders of the American Cyanamid Co. The protection was in this form, that if the Government should at any time determine to dispose of the plant it should give to Air Nitrates Corporation an opportunity to acquire that plant, not on any better terms, but on precisely the same terms as the best the Government was willing to accept from somebody else.

Senator NORBECK. You mean by that that the Government, in signing this contract, signed away from its own people the right to make cheap fertilizer in competition with you, then?

Mr. HAMMITT. No; for the Government itself can operate this plant without violation of this clause of the contract.

Senator NORBECK. Do you contend that the Government can not—

Mr. HAMMITT. The Government can not dispose of this plant to a private party to compete with us on any better terms than the Government is willing to dispose of this plant to us; but if anybody is prepared to take this plant from the Government on terms more favorable to the Government than we are willing to take the plant on, then the Government may dispose of the plant to that party on those terms.

The CHAIRMAN. Now, your contention is, as I understand it, that by virtue of this article 19 in your contract the Government must permit you to duplicate any offer made by anybody else. Is not that about it?

Mr. HAMMITT. That is one way that the thing might work out, but there are other ways.

The CHAIRMAN. Well, considering these bids, it seems to me that would be true. Suppose Congress compared these several bids we have and would say, "Well, we have decided to accept Mr. Ford's offer." Now, then, it would be necessary, before we could do that under this contract, as you contend, to give you the opportunity to take it instead of Mr. Ford?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. And if we decided that the Alabama Power Co. had made the best offer we must give you the privilege of making the offer that they have made?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. And give you six months to decide?

Mr. HAMMITT. Giving us a reasonable time, not exceeding six months.

Senator NORBECK. I have begun to think that the Congressional committee that said that we should scrap the whole thing had the right view of it, Mr. Chairman. We don't seem to have anything.

The CHAIRMAN. There is this one road out of it. The bill I have introduced avoids this clause of the contract at least. We don't need to pay any attention to it if we pass that bill. Or at least that is the way I look at it.

Senator NORBECK. It looks this way, then, that you really gave the Government something more than they paid you for, and as a consideration the Government tied its hands in the matter of cheap fertilizer to some extent. Is that it?

Mr. HAMMITT. I could go even further than that and say that neither Air Nitrates Corporation nor the American Cyanamid Co. has received one single penny of compensation in the form of profit for the design and construction of the Muscle Shoals nitrate plant.

Senator HEFLIN. Your country was in peril at the time you came to its rescue to help furnish these nitrates. You would have been doing your patriotic duty if you did not get anything, would you not?

Senator NORBECK. You mean you got no profit out of this work, directly or indirectly, in any way, or your people—that is what you mean?

Mr. HAMMITT. Yes, sir; and I don't mean to suggest that it was not the intention when the contract was drawn that we should be compensated for the service that we rendered. This contract, like every other contract for the construction and operation of a large war plant, for the rendering of large services to the Government, did involve provisions for compensation, but the way the thing has actually worked out Air Nitrates Corporation and the American Cyanamid Co. have actually netted, on this operation, a loss.

Senator HEFLIN. You would have entered into this contract, though, even if article 19 had not been agreed to by the Government, would you not?

Mr. HAMMITT. I was not present in the negotiations which led up to the writing of this contract, and I certainly would hesitate to say that any American corporation would refuse, even to expose itself to the extent of the possible destruction of all of the investments of its stockholders, if that were necessary in order that it might render the Government a service necessary to the winning of the war; but I think it is quite clear that it would be most unjust to have asked that sacrifice of Air Nitrates Corporation and the American Cyanamid Co., and it was not asked, and this provision in this contract was inserted because this represented the kind of protection that both the representatives of the company and the representatives of the Government thought it was proper to insert.

The CHAIRMAN. I am not sure that I quite get your position that you have taken, and I want to see if I have it right.

As I understand you, your contention is that if this big plant down here owned by the Government is sold and operated and the product went into commerce, it would have a tendency to ruin your business, the business of your Canadian plant, for instance, that is doing the same kind of work?

Mr. HAMMITT. It would have that tendency; yes, sir.

The CHAIRMAN. Is that the objection you have to it, or have you any other objection except that? Would it put you out of business, to use the ordinary expression? As I understand it, the supply would be so great that would be put on the market—

Senator NORBECK. Which would result in a cheap product.

The CHAIRMAN. That it would result in putting your product down so low that it would ruin your company?

Mr. HAMMITT. It would be impossible for us to continue to make it and sell it without a heavy loss, and, of course, by the same token it would be impossible for it to be produced at Muscle Shoals and sold without a heavy loss on the Muscle Shoals operation. In fact, the loss on the Muscle Shoals operation would undoubtedly be very much heavier than our loss, yet we could not match dollars against the United States Treasury, and if the United States Treasury is put back of the Muscle Shoals operation we would be extinguished long before the United States Treasury would be extinguished.

Senator HEFLIN. But you suggest that Ford can not succeed in making commercial fertilizer at Muscle Shoals, and if that is the case he would not be your competitor very long?

Mr. HAMMITT. If he actually guarantees to continue this operation for a hundred years, even though it be at a loss, if that be the guaranty that he is assumed to have made, then he will continue until Mr. Ford's bank account is extinguished, and we can not match dollars with Mr. Ford, so we are going to be extinguished first.

Senator HEFLIN. We are trying to get cheaper fertilizers for several million farmers in the United States, and if we can bring that about it really would not be such a serious thing for one or two concerns to be put out of business.

Mr. HAMMITT. But I maintain that it is a very serious thing to contemplate that the United States Government, having entered into an agreement on the strength of which it induced a company to expose its processes and to render a service, should thereafter disregard the obligations which it had entered into in that contract.

Now, I presume the committee is aware of the fact that the legality of this provision of the contract has been called in question by the Judge Advocate General of the Army. I did not come before this committee to argue the question of legality. I came in confidence that I might rest my case upon the public policy back of this principle, that the Government should live up to its contracts and not escape from them by reason of any legal technicality. I want to make it clear to the committee that not only do we believe that this contract is valid, but that we took all necessary precautions, in cooperation with the officers of the Government, to ascertain its legality before the protection was placed in this particular form. The question was a serious one, and at our suggestion and with the approval of the representatives of the Government, we retained Mr. Charles Evans Hughes, the present Secretary of State, to advise regarding the form in which this protection should be placed, and it was on the strength of his advice that the protection was provided in the form in which it is contained in article 19. Now, we maintain that it would be unfair, Senator, to require us to go through court proceedings in conflict with the United States Government in order to establish our right to this reasonable protection which the Government, through its contracting officers, agreed would be given to us.

Senator NORBECK. What is your investment in a plant that makes a similar product which investment you speak about being in jeopardy?

Mr. HAMMITT. Inasmuch as cyanamid is at the foundation of our entire industry, I should say investments that are threatened include everything we have except our phosphate mines in Florida, and that would run approximately 11 to 12 million dollars. As a matter of fact, it would include a portion of the investment in the phosphate mines beyond that.

Senator NORBECK. Is your plant in operation at this time?

Mr. HAMMITT. Yes. It is not operating to capacity, but it is in operation.

Senator NORBECK. Making commercial fertilizer, or the ingredients for it?

Mr. HAMMITT. Yes, sir; making cyanamid, of which we have for years been supplying the entire American requirements, and the maximum of those requirements has run up in the largest year to about 40,000 tons of cyanamid.

Senator HEFLIN. In order to get this project yourselves at Muscle Shoals, in order to keep Mr. Ford from getting it or anyone else to compete with you in the manufacture of commercial fertilizer, what is your company willing to pay to the Government for it?

Mr. HAMMITT. My company is not able to offer to take the nitrate plant from the Government on any terms that would be considered by the representatives of the Government as being at all reasonable. Neither, for that matter, is Mr. Ford, and Mr. Ford has not proposed anything of that sort, and I venture to say that if we had come to Washington and made the kind of offer that Mr. Ford made the matter would not have received favorable consideration. Upon analysis it is quite evident that Mr. Ford's interest is in the thing that Mr. Ford's organization has had experience with and understands in connection with that Muscle Shoals project, namely, power, and all the fertilizer end of the Ford offer amounts to is something that may attract sufficient support in order to make it possible for the power contract to be written.

Senator NORBECK. Do you maintain that it would be unfair for the Government to form a corporation of its own for the operation of these plants, under your contract, even though they could legally do it?

Mr. HAMMITT. Well, I have stated, Senator, that I do not consider that the Government operating the plant itself would be a violation of article 19 of

our contract, although it would be most unfair and unwise for the Government to enter into competition with a commercial business, using that plant or using any other property on a basis on which the Government were not subjected to the same necessities of earning dividends upon their investment and paying their way that private capital is subject to earning.

Senator NORBECK. You are stating two things, first, that it is unwise, and, second, unfair. The question of wisdom would be as viewed from the point of view of the tax payer, as I understand it?

Mr. HAMMITT. Yes sir.

Senator NORBECK. In other words, you contend that the Government could not successfully do that, even though it was fair to enter into the competition. Is that it?

Mr. HAMMITT. Yes, and not only from the point of view of the benefit of the tax payer in the question of taxes, but from the point of view of the benefit to the nation as a whole in the development of industry, because I am thoroughly convinced that you must depend upon private industry for the development of the fertilizer manufacturing business as for the development of other business, and that if the Government enters into that field of industry, it will inevitably be compelled to take over the entire fertilizer industry.

The CHAIRMAN. Does the American Cyanamid Co. operate any plant except the one at Niagara Falls, Canada?

Mr. HAMMITT. Yes, sir. We have a plant at Warners, N. J., on the New Jersey side of New York Harbor.

The CHAIRMAN. What power do you use there?

Mr. HAMMITT. We use public service power, and the power consumption is exceedingly small.

The CHAIRMAN. Do you use the cyanamid process, and does it not require a vast amount of power?

Mr. HAMMITT. The operations at Warners, N. J., are that part of the operations under the cyanamid process where the power requirements are exceedingly light. I suppose our entire consumption is 300 kilowatts.

The CHAIRMAN. You get the product, then, after it is partially manufactured, do you?

Mr. HAMMITT. We get it at the Warners plant in the form of cyanamid, and we ship to the Warners plant, when that plant is in operation, phosphate rock from our phosphate mines in Florida, which is another operation on which we are engaged, and we produce ammonium phosphate by processing of the phosphate rock and a subsequent processing of the ammonia and of the phosphoric acid thus produced.

The CHAIRMAN. Do you get anything out of the air in New Jersey?

Mr. HAMMITT. No, sir.

The CHAIRMAN. Where do you get the product that you take there which was originally extracted from the air, if there is any?

Mr. HAMMITT. The product that is extracted from the air is entirely produced at Niagara Falls, Canada.

The CHAIRMAN. You ship the product down to New Jersey and then finish the operation there?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Have you any other plant except the one in Canada that takes the nitrate out of the air?

Mr. HAMMITT. No, sir.

The CHAIRMAN. That is the point I want to get at. You use your product there in making fertilizers at other plants?

Mr. HAMMITT. Yes, sir; but we produce no complete fertilizer.

The CHAIRMAN. Nowhere? Not in any of your plants?

Mr. HAMMITT. Not for use in the United States. There is possibly a use for ammonium phosphate as a complete fertilizer in foreign fields, but I mean that we are not engaged in the American fertilizer industry.

The CHAIRMAN. That is what I wanted to bring out, to see what the facts were in regard to that. Nowhere, then, in this country, are you engaged in the manufacture of a fertilizer?

Mr. HAMMITT. That is true; yes, sir.

The CHAIRMAN. Then why do you object? You are not in the fertilizer business. Why do you object to the Government or any of its assignees, like any of these bidders, using nitrate plant No. 2 at Muscle Shoals to make fertilizer? Why does that compete with your business?

Mr. HAMMITT. Because if they operate by the cyanamid process, which, by the way, if the only process by which that plant in its present condition can be

operated, they will produce materials which are in competition in the American market with the materials which we produce at Niagara Falls, Canada.

The CHAIRMAN. You mean some by-products?

Mr. HAMMITT. No. I mean that if they produce sulphate of ammonia, for example, they will be producing a product which is in competition with our cyanamid.

The CHAIRMAN. Let us take it as it really is. It is proposed by Mr. Engstrom in his proposition and by Mr. Ford in his, that there shall be manufactured at this nitrate plant No. 2 a fertilizer, and that is what Congress wants to utilize the plant for. Just bear in mind clear through that that is what we wanted in time of peace produced at Muscle Shoals—a fertilizer. You don't produce fertilizer anywhere in America? How does it happen that this plant gets in competition with you, then?

Mr. HAMMITT. We do not—of course, if the plant were used entirely for the production of a complete fertilizer, that would mean that there would go into the American market so many tons of complete fertilizer that would be provided with their ammonia content by the Muscle Shoals nitrate plant. That tonnage of complete fertilizer would displace just so much other tonnage of complete fertilizer which, therefore, could not be manufactured, because it could not be sold, and that other tonnage which would thus be displaced would deprive us of the market for that amount of ammonia that goes into that fertilizer that can be obtained from cyanamid.

The CHAIRMAN. Then I get this idea from you. While you are not making fertilizer you are making things that other people to whom you sell put into fertilizer. Is that the idea?

Mr. HAMMITT. Yes, sir.

Senator NORBECK. Making one of the ingredients of fertilizer. That is what the fact is?

Mr. HAMMITT. That is it; yes, sir.

The CHAIRMAN. And, of course, this plant down here is going to make the same ingredient in fertilizer, is it?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Even though they do not make a complete fertilizer.

What do you have to pay for your power up there in Canada?

Mr. HAMMITT. Without going into the details of the terms of the contract, which are rather complicated, it comes to approximately \$10.50 per horsepower year.

The CHAIRMAN. Can you transpose that without difficulty into kilowatts?

Mr. HAMMITT. Yes. You divide it by seven-tenths. \$15 per kilowatt year.

The CHAIRMAN. How much per kilowatt hour? That is the way we have been accustomed to figuring it.

Mr. HAMMITT. I will say parenthetically, Senator, that that is a very old power contract, and it still has some years to run, and it was written at a time when the selling price of Niagara Falls power was considerably less than it is at the present time.

Our power cost is equal to \$15 per kilowatt year, or 1.7 mills per kilowatt hour. That is primary power.

The CHAIRMAN. That is the only kind you use. You buy it, don't you?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. You do not operate the power plant?

Mr. HAMMITT. Oh, no.

The CHAIRMAN. That is done by the Government, is it not?

Mr. HAMMITT. It is done now by the Canadian Hydroelectric Commission. It was done by a private company when we wrote that contract. Of course, the dam is a natural dam at Niagara.

The CHAIRMAN. That would be 1.7 mills per kilowatt hour?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. At that price for power, it is not possible, as I understand it, by means of the cyanamid process, to get nitrates out of the air and make fertilizer that will sell cheaper than the present prices of fertilizer on the American market. Is that right?

Mr. HAMMITT. If you are speaking of the Muscle Shoals plant—

The CHAIRMAN. Any plant. I am speaking of the cost of power. What I want to find out is how cheap do we have to have power in order to make fertilizer cheaper than it is made now?

Mr. HAMMITT. Why, I think that you can find uses, certainly after a few years from now, if not now, for power as cheap as 1.7 mills to a limited quantity in the manufacture of fertilizer materials in this country, but you can not find a use by that method of the Muscle Shoals nitrate plant, because you see the Muscle Shoals nitrate plant is very limited in what it can do, in the first place, and, in the second place, it is an enormous great big plant, which is uneconomical for a very small operation, and economical only for a large operation.

The CHAIRMAN. Suppose you operated it at its capacity. Then it would be economical, would it not? We have always been told that big fellows can operate the cheapest.

Mr. HAMMITT. But you could not find a market for your product if you operated at full capacity.

The CHAIRMAN. Do you mean that if we operated the plant to its full capacity we would put so much fertilizer on the market that the farmers could not use it?

Mr. HAMMITT. Well, as a matter of fact, you can not even operate your present capacity, and will not be able to do it for years, and find a market for your fertilizer. The total amount of fertilizer sold during the past year was probably 50 per cent or less of the fertilizer producing capacity of the country, and our operation at Niagara Falls, has been, within a period of a year, curtailed even more than that.

The CHAIRMAN. Don't you think that is brought about because you charge so much for fertilizer the farmers can not buy it?

Mr. HAMMITT. Senator, that can not be true, because when your operation goes down it is not a question of how much profit you make, but it is a question of whether you lose more by keeping your plant idle or by operating your plant, and that is always the way that problem faces a manufacturing company. The company is compelled to carry in a suspense account a considerable amount of overhead charges that run along anyway whether the plant is operated or not, and if it can operate the plant and sell its product at just a little bit more than the actual manufacturing cost, exclusive of overhead, it is better off than if it kept the plant idle.

The CHAIRMAN. Yes; I can understand that.

Mr. HAMMITT. So you will always find that when plants are down to that extent manufacturers are not at that time thinking of profit so much as they are thinking of curtailing losses.

The CHAIRMAN. I don't think that is always true, because it very often happens that the manufacturing concern can get hold of all the plants and can afford to shut down three or four of them and raise the price on the balance so high that it can make more money on them by keeping them idle than by operating them.

Mr. HAMMITT. We are not in that position, Senator.

The CHAIRMAN. I am not saying you are, but as an abstract proposition there is no doubt about that being true, and it is often done.

Mr. HAMMITT. I recognize there is really that possibility, but I was really thinking in terms of our own problem, and our own problem has been, during the past year, as I have stated.

Senator HEFLIN. How does the amount of fertilizer used in the United States in 1921 compare with 1920 and 1919? Is it not a fact that the farmer bought less fertilizer in 1921, a great deal less amount of fertilizer in 1921 than in 1920?

Mr. HAMMITT. That is quite true, Senator, but it is also true that the fertilizer-producing capacity of the United States is approximately 10,000,000 tons a year, and the largest amount of fertilizer which the American farmers have ever purchased in any year is approximately 7,500,000 tons.

Senator HEFLIN. But don't you suppose if the price of fertilizer was cheaper they would consume a great deal more?

Mr. HAMMITT. I think that while that may not, perhaps, have been true during the past year, ultimately there would be an increase in the consumption of fertilizer with a reduction in the price.

Senator HEFLIN. Oh, yes; I think so.

The CHAIRMAN. We will adjourn until 2.30, and we will meet in the Commerce Committee room on the gallery floor of the Senate.

(At 1.15 o'clock p. m. a recess was taken to 2.30 o'clock p. m.)

AFTER RECESS.

The committee reconvened at 2.30 o'clock p. m.

STATEMENT OF MR. J. O. HAMMITT.—Resumed.

The CHAIRMAN. All right, you may proceed, Mr. Hammitt.

Mr. HAMMITT. I think, Senator, I have completed the statement that I wished to make.

The CHAIRMAN. This contract is in the record, and I think it was put in by Major Burns. [Addressing Major Burns.] Major, in your testimony, did you put this contract in the record?

Major BURNS. Yes, sir.

The CHAIRMAN. I have not examined it closely, but I think there is a place in it where your company gets a royalty, is there not, for everything that is made there? [Addressing Mr. Hammitt.]

Mr. HAMMITT. Everything that is made with the use of the cyanamid patents. That is in the license agreement, which is made a part of the contract, and there are two provisions relating to royalties. One you will find on page 27. That is article 6.

The CHAIRMAN. Yes; that is the one I am looking at now.

Mr. HAMMITT. There is another one also.

The CHAIRMAN. Yes.

Mr. HAMMITT. The other one is on page 29, article 10.

The CHAIRMAN. Yes; it is a part of article 10. Does not that compensate you for the use of your patents, or is not that the idea of it?

Mr. HAMMITT. That is intended to be compensation for the use of our patents. Of course, it is a part of a contract that provided protection for the American Cyanamid Co. and its subsidiary, Air Nitrates Corporation, in several different ways, and one of the forms of protection that are afforded is contained in these provisions regarding royalties.

The CHAIRMAN. Neither the Government nor anyone else, under this contract, could make anything without paying you a royalty, could they?

Mr. HAMMITT. Unless they operated without the use of any of the cyanamid patents. The only reason I mention that is because of Mr. Mayo's testimony, because, within our knowledge, there is no way the plant can be operated without making use of those patents.

The CHAIRMAN. Then, how are you going to be hurt if the Government or anybody else operates the plant?

Mr. HAMMITT. We do not consider that these royalties constitute complete compensation or satisfactory compensation for the injury that would be done to us if this plant were taken over from the Government by some one else on terms so favorable as to make it possible for them to produce and place the product on the market.

The CHAIRMAN. Well, your objection is not that you are not getting paid, but that somebody else is going to get too much? Does it not simmer down to that?

Mr. HAMMITT. No; our objection is that the amount that would be paid would not be adequate compensation for the injury that would be done to us.

The CHAIRMAN. What was the object of putting these royalties in then?

Senator NORBECK. And you have not been operating at a profit, have you?

Mr. HAMMITT. Yes; we have been operating at a profit. The American Cyanamid Co., as I testified this morning, has paid 6 per cent cumulative dividends on its preferred stock, with the exception of one quarterly payment. It has not paid anything on its common stock. Of course, it is the hope of the stockholders of the company that it will ultimately be possible to pay dividends on the common stock, and it is quite commonly the case that in a manufacturing operation which breaks into new fields, as the American Cyanamid Co. did, the earlier years of the operation are not profitable years.

I should like to say this Senator, regarding this aspect of the case, that the whole theory of the patent law, of course, is to encourage invention, and the encouragement of invention is extended under the general patent law not in the form of provision that anybody who obtains a patent shall be paid a royalty by anybody who operates under the patent, but in the form that anybody who obtains a patent shall have, during a certain period of years, the exclusive right to the use of the patent.

The CHAIRMAN. To give him a monopoly of it, in other words.

Mr. HAMMITT. Absolutely.

The CHAIRMAN. Yes.

Mr. HAMMITT. That is the theory of the patent law. Now, when we came to the negotiation of this contract with the Government it was agreed on both sides that a royalty should be paid by the Government in case it operated, or by any assignee of the Government in case it should operate, the plant; but that in addition to that we should have protection against the virtually compulsory licensing of another operator under our patents. This is what this would amount to if we did not have some such provision as is contained in article 19. It is a matter of business judgment, of course, whether a royalty provision is adequate protection for the stockholders of the American Cyanamid Co. It is not the full extent of the protection that is given to us under this contract, and it is our business judgment that it is not adequate protection.

The CHAIRMAN. Well, of course, the getting of a royalty is not as good as the getting a monopoly; everybody will concede that, but you made this contract and provided for a royalty.

Mr. HAMMITT. Yes, sir; and it was provided that we should have first chance to buy the plant unless some one else is prepared to take that property from the United States on terms more favorable to the United States than we are prepared to take that property on.

Senator HEFLIN. I understood you to state this morning that you were not prepared to take it at all; that you were not able to bid an adequate price.

Mr. HAMMITT. I did not mean to convey that impression at all, Senator. The impression I meant to convey was that we would not be prepared at this time to take the nitrate plant and operate it unless you attach to that nitrate plant, as you do in the offer of Mr. Ford, something else of value.

The CHAIRMAN. Let us get at it in this way: Are you prepared to take the offer of Mr. Ford? Are you prepared to comply with his proposition?

Mr. HAMMITT. I have not the least question, Senator, that if this property is offered to us on the terms contained in the Ford offer it will be accepted, and the only reason I state it that way instead of saying yes is, of course, because I can not definitely speak for the board of directors of Air Nitrates Corporation or of the American Cyanamid Co.; but I will say that I certainly would recommend it, and I will say I have not the slightest doubt that it would be accepted, and it will not take any six months to determine whether it should be accepted or not.

Senator HEFLIN. Now, right in that connection, you stated this morning that in your judgment if Mr. Ford complied with the contract and undertook to manufacture fertilizer there he would go broke. You now say you would accept his offer and do what he proposes to do.

Mr. HAMMITT. I did not mean there to convey the impression that if Mr. Ford continued under that particular contract he would go broke. What I meant to convey is—and I think you will find that this is really the extent of my testimony, Senator—that anyone who attempted to operate that plant, relying solely on the operation of that plant for his profits, would lose money, and lose money very rapidly, at any rate, if he operated to capacity. Ultimately Mr. Ford, or anybody else, would go broke on that kind of an operation; but that is not what is contemplated in Mr. Ford's proposition. The principal part of Mr. Ford's proposition relates not to the nitrate plant at all, but to the water power, and in the form of a Government-financed water power granted to him under a 100-year lease Mr. Ford gets something of such great value that it would doubtless make up all of his losses on the operation of the nitrate plant.

The CHAIRMAN. Now, let us take another proposition. Suppose the committee decided that they were going to accept Mr. Engstrum's proposition. Are you willing to do that?

Mr. HAMMITT. I will have to confess that I have not studied Mr. Engstrum's proposition with the same care that I have studied that of Mr. Ford, because a first reading of it indicated that, in substance, it was a cost-plus contract, upon which the funds were to be advanced by the United States, and the compensation would have to be entirely independent of any risk on the part of the company; but, with that qualification, I will say that I have no more doubt that we would accept the Engstrum proposition than that we would accept the Ford proposition.

The CHAIRMAN. How about the Alabama Power Co. proposition?

Mr. HAMMITT. The Alabama Power Co. proposition involves the taking of only a relatively small portion of the nitrate plant, of course, namely, the power

plant, and I think I would have to give some further study to that question before I would be justified in saying to you that we would accept that proposition if it were offered to us. I do not want to say that we would not accept it; but I do not want to make as strong a statement of conviction that we would accept it, regarding that offer as I have made regarding the others. Of course that is a power proposition, pure and simple. The American Cyanamid Co. is not at the present time in the power business.

The CHAIRMAN. Well, of course, you could not accept any of these propositions without going into the power business.

Mr. HAMMITT. We could not, of course.

The CHAIRMAN. To quite an extent, at least.

Mr. HAMMITT. But if, for example, the Ford proposition was to be the basis of the turning over of that nitrate proposition, I am sure that we could not afford not to go into the power business.

The CHAIRMAN. We still have another proposition. Have you considered Parsons's proposition? The committee has not taken it up yet. It just came in a little while ago.

Mr. HAMMITT. I think I have read every one of these propositions at least once, and those that I considered most serious I studied carefully, namely, the Ford proposition, and the Alabama Power Co. proposition.

The CHAIRMAN. As between the Ford proposition and the Alabama Power Co. proposition and the Engstrum proposition, which one would you rather have?

Mr. HAMMITT. We would, in my judgment, very much rather have the Ford proposition.

The CHAIRMAN. You think that is better for whoever gets it, the Ford proposition has a greater opportunity to make a profit than any of the others?

Mr. HAMMITT. That is my judgment; yes, sir; and if you wish me to state which one is in the second place, I would say—

The CHAIRMAN. Yes.

Mr. HAMMITT. The Engstrum proposition.

The CHAIRMAN. The Engstrum proposition?

Mr. HAMMITT. Yes.

The CHAIRMAN. You would take that before you would take the Alabama Power Co. proposition?

Mr. HAMMITT. That is my judgment; yes, sir.

The CHAIRMAN. Then, your judgment as to all of these offers, from the point of view of the person who is getting them, would be first Ford, next Engstrum, and next the Alabama Power Co. proposition?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Arguing now for the benefit of the Government, would it follow that, acting on behalf of the Government, we should better take them in the inverse order? That may not, considering now the interests of the Government instead of the person who is going to get the property, the Alabama Power Co. proposition is the best one from the Government standpoint?

Mr. HAMMITT. I would say, without question, that it is, Senator; but I would not recommend that the Government accept the Alabama Power Co. proposition. If I were in the position of the Government I believe I would trade better on that water power than the Alabama Power Co. proposition.

The CHAIRMAN. You think the Government, then, is in shape to get a better proposition than anybody has offered?

Mr. HAMMITT. I do, if the Government will separate—

The CHAIRMAN. Why did you not make such a proposition?

Mr. HAMMITT (continuing). If the Government will separate the water power from the nitrate property and offer each of these separate branches of that project for development, it will be able to obtain, in my judgment, for the development of the water power a proposition even better than the proposition that the Alabama Power Co. has made to the Government, although that very much more nearly approaches the kind of a contract that, in my personal judgment, the Government should write, than any of the other offers that have been made; but I think the Government under those circumstances, would not receive any offer for the nitrate plant that the Government would be justified in considering.

The CHAIRMAN. Well, you think we would have to couple them up in order to get anybody to take the nitrate plant?

Mr. HAMMITT. I do; but I do not think you ought to pay that price in order to get anybody to take the nitrate plant, Senator. I will say that if you do not

couple them up you could, no doubt, get somebody to take the nitrate plant by paying him in cash or in some other thing of value the price which Mr. Ford asks you to pay in the form of water power. That is the inducement to Mr. Ford to take the nitrate plant, but I presume that inducement could be put in some other form than water power.

The CHAIRMAN. Had you negotiated at all with the Government with regard to taking over the nitrate plant under your contract?

Mr. HAMMITT. No; we have discussed with the representatives of the Government a great many times the question of possible uses of the nitrate plant, and always with a view to ultimately developing a manufacturing program for the nitrate plant that would make a commercial operation possible. But we have not at any time succeeded in developing such a manufacturing program, and it is our judgment that nobody else has; and, furthermore, that we will probably realize our hopes of being the first ever to develop such a program. That is not illogical, because we have had more experience in the operation of the processes for which that plant was designed than any other organization.

The CHAIRMAN. First, let me ask you: Have you any interest in the so-called Haber process?

Mr. HAMMITT. No, sir.

The CHAIRMAN. Is not that a newer process and a cheaper one?

Mr. HAMMITT. The question of whether the Haber process is cheaper or more expensive doubtless depends upon the location of the plant that is operating one or the other process and upon a number of different facts, so that it is entirely possible and, as a matter of fact undoubtedly is true, that in some cases the Haber process is more adaptable to the conditions, and in some cases the cyanamid process is more adaptable.

The CHAIRMAN. Well, take them as they are down there, then what?

Mr. HAMMITT. I do not want to attempt to qualify as an expert on the Haber process, but I think it entirely possible that, with equally efficient plants located at Muscle Shoals, there might be just as much likelihood of a place for one process as for the other.

Your Haber operation is very much handicapped in this country, however, by reason of the fact that, at any rate, as it is operated in Germany it requires a very high grade of labor from the point of view of technical training, and that labor is not available in this country at low wage rates. The cyanamid process uses for most of its employees what you might call semiskilled labor—furnace men, men who are inured to a certain kind of operation and somewhat specially trained in a certain kind of repetitious work, but it is a class of labor that in the Muscle Shoals district it would be very easy to obtain, and I think the class of labor that would be required for the operation of the Haber plant would be more difficult to obtain. On the other hand, there are relative advantages and disadvantages that might be balanced off one against the other, with a possibility of reaching a different result and making the Haber operation at Muscle Shoals more successful than the cyanamid operation at Muscle Shoals.

The CHAIRMAN. Among scientific men and among experts, is not the Haber process considered one that is most promising now?

Mr. HAMMITT. I think there is a very wide difference of opinion among scientific men. I would hesitate to say that the weight of opinion was on either side, Senator.

The CHAIRMAN. Well, it is a newer process, is it not?

Mr. HAMMITT. Yes; it is a newer process, but the two are both of them relatively so new that the possibility of the development—

The CHAIRMAN. Germany has been using both processes, has she not?

Mr. HAMMITT. She has; yes, sir.

The CHAIRMAN. And is using them both now, is she not?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Is she making a fertilizer now by the cyanamid process?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. And she uses steam power to do it, does she not?

Mr. HAMMITT. She is operating a cyanamid process under steam power; yes, sir. I am not sufficiently familiar with the present conditions in Germany as to costs of operation to be able to analyze that German situation for you successfully. You must remember that in Germany every economic factor at the present time is turned upside down. Germany is employing labor at less than the amount of money it costs the labor to live, and is making up the difference by giving food subsidies at the cost of the Government.

The CHAIRMAN. The big question in the cyanamid process is the power, is it not? That is the biggest item in the thing, is it not?

Mr. HAMMITT. No; I would not say that that was the biggest. The labor item is a very heavy item in the cyanamid process.

The CHAIRMAN. How it is that Germany can afford to manufacture under the cyanamid process, or the other one, for that matter, in times of peace, without any cheap power, and make fertilizer, when we, with our power, as you say, the cheapest power in the world, are not able to do it and sell fertilizer at a reasonable price?

Mr. HAMMITT. I said of this particular power under the Ford proposition it would be the cheapest power on the American Continent, but, of course, I meant to Mr. Ford. I did not mean it would be the cheapest of development. He would get it at less than the cost of development.

The CHAIRMAN. Well, take the power that you get at Niagara Falls.

Mr. HAMMITT. That is exceedingly cheap power; but I have before me a set of figures that were submitted by the nitrate director of the Ordnance Department at the hearings before this same committee a year ago, and those figures, as to manufacturing costs, are at least relatively correct.

These figures give the cost of producing a ton of sulphate of ammonia, under a certain assumption, at \$48.19, and, under a certain other assumption at \$58.70. Now, the difference between the first assumption and the second assumption is entirely in the power. That is, under the first assumption, the power is figured at three-fourths of a mill per kilowatt hour, and, under the second assumption, the power is figured at 4 mills per kilowatt hour; so that the difference between the three-fourths of a mill and the 4 mills, namely, $3\frac{1}{4}$ mills per kilowatt hour, is the difference between \$48.19 and \$58.70, or just about \$10 per ton of sulphate of ammonia produced by the cyanamid process. Now, that \$10 per ton represents an increase of $3\frac{1}{4}$ mills—let us say for purposes of easy calculation, 4 mills—in the cost of power. That would be \$2.50 per ton for every mill increase in the cost of power. The actual cost of power in this item of \$48.19 for sulphate of ammonia was \$2.10. That was the power cost as submitted by the Ordnance Department, and under the higher rate for power the power cost, out of a total cost of \$59.13, was \$11.23. So that you see in one case the power represented about 4 per cent of the cost of the sulphate of ammonia, and in the other case, the power represented about 20 per cent.

The CHAIRMAN. All of the other conditions were the same as these examples, were they?

Mr. HAMMITT. Well, I have incorrectly stated that in actual figures, because I have taken the power cost per ton of lime nitrogen, and used that for the power cost per ton of sulphate of ammonia, but the fraction of difference between the two is so small that these percentages that I have stated would not be affected by it. In other words, the power consumption is practically entirely in the manufacture of the lime nitrogen. What I mean to convey by that, Senator, is not that the power is not a very important factor, as it quite obviously is, in the cost of production, and I do not mean to convey either that the difference between cheap power and expensive power may not make all the difference between a successful and an unsuccessful operation, because you are dealing principally with very close margins as between a successful and an unsuccessful operation, but I do not want to give testimony that would create the impression that the largest item of cost is necessarily power.

Senator NORBECK. The point is this, that even with free power there would not be a great reduction in the cost of the product; is that it?

Mr. HAMMITT. Well, as against three-fourths of a mill power per kilowatt hour, that reduction would be \$2.10 per ton of lime nitrogen, and substantially that per ton sulphate of ammonia. In the case of the 4-mill power, it would be \$11.22 per ton of lime nitrogen and substantially that per ton of sulphate of ammonia. These figures submitted by the Ordnance Department are based upon the actual test runs that were made in the Muscle Shoals nitrate plant, and are quite competently computed.

The CHAIRMAN. Now, according to your idea, as I understand it, the only value of the nitrate plant is to let it stand there, to be kept in condition to be used in case of war.

Mr. HAMMITT. I think that is the best disposition that can be made of that nitrate plant until such time as, by reason of changes in market conditions or advancements or new discoveries in the art of manufacture, it is possible to prepare a manufacturing program for the plant that would give a promise of

paying out; but even though it were necessary to keep that plant in a stand-by condition indefinitely, Senator, I think that this committee and the Congress might just fy all the expenditures made for that purpose, which amount to exceedingly little in comparison with the expenditures which are made and appropriated annually for very much less important measures of preparedness, and that nitrate plant, in a stand-by condition, would, in my judgment, be a better preparedness asset than that plant in operation. That is, if the edict of Congress should be that the plant should never be operated in times of peace, it would, in my judgment, be a better preparedness item than if it should be operated during peace times for the manufacture of peace-time products. I am very much impressed and inclined toward that view by the experiences that we had during the war, when what we needed was not a plant with a capacity to produce nitrates, but something with a capacity to produce more nitrates than the country had been in the habit during peace times of consuming. If you keep your plant in idleness, you will have other plants developed to supply the peace-time needs, and you will also have a reserve of capacity that can be utilized in time of war. I would not recommend keeping the plant indefinitely in idleness, because I think that the preparedness feature of the problem must be subordinated to other features of the problem, but what I mean to convey is that, purely from a preparedness point of view, that plant would be worth even more in idleness than in operation, and therefore, if you are compelled during a period of years to maintain it in idleness, I think Congress should feel justified in making the necessary appropriations for that purpose.

The CHAIRMAN. Then, we would have to maintain dams? You would not want to abandon them, would you?

Mr. HAMMITT. My recommendation regarding the water power dams, inasmuch as the Government unwisely, I believe, has already expended \$17,000,000 in construction work down there—

The CHAIRMAN. What do you mean by "unwisely"?

Mr. HAMMITT. I mean the money was spent at the very highest prices of labor and materials that we have ever experienced in this country.

The CHAIRMAN. Well, was the Government to blame for that? How could it help it?

Mr. HAMMITT. The Government might have waited, inasmuch as there was no war emergency involved in the construction of that dam. All of the money was spent, with the exception of a very few thousands of dollars, after the armistice had been signed, and the Government could have waited, and I think should have waited, until there were cheaper labor and material rates. That is the only criticism that I wish to offer of that program; but since the Government has spent that money, it is my judgment that the wise thing to do with that water power project is to relieve it of the restrictions existing in the law, and then make it possible for that water power to be developed under the provisions of the Federal water power act. If you do that, I am thoroughly satisfied that you can have that water power developed and placed in operation without the expenditure of another penny of the Government's money on it. In addition to that, you would receive an actual return, not in the form of secondary power, or of any indefinite thing, but, in my opinion, you could negotiate a return in the form of actual cash compensation to the Government for expenditures that the Government has already made.

The CHAIRMAN. By leasing it to some one.

Mr. HAMMITT. By issuing a license to some one under the Federal water power act to complete it at its own expense and selling to that party the Government's uncompleted structure and its construction equipment on the job.

The CHAIRMAN. Then, of course, if the Government went to war, in order to obtain the power, it would have to buy it, or condemn it and take it and pay for it. In that event, it would subject itself to a very large amount of damages. It would not be only the value of the property, but if the owner or lessee had made the contracts, as is very likely, running over a term of years, with various corporations and municipalities and other who wanted to buy the power, and if the Government took it over and broke all of those contracts, it would have to pay damages for each one of them, of course?

Mr. HAMMITT. There are two matters that ought to be considered in that connection, Senator. In the first place, there is plenty of power at Muscle Shoals now for the operation of the nitrate plant, and if you wished to emphasize the national defense aspect of the problem to the extent of providing your-

self with the very best preparedness, you would keep in standby condition not only the nitrate chemical plant proper, but also the steam power plant that is connected with it, and that steam power plant, while the power would be expensive, nevertheless, would be capable of operating the nitrate plant to its full capacity in times of war, and you could turn it over immediately. The second thing I think you should have in mind in connection with that thought is that the Federal power act itself contains provisions under which the Government can take over the power in times of emergency. Just exactly what those provisions are I can not state.

The CHAIRMAN. Of course, it could do it without those provisions, but it would have to pay damages, and it ought to pay them.

Mr. HAMMITT. Yes; but I think, under the Federal water power act, there are some special guaranties that would make it simpler and less expensive for the Government to take it.

The CHAIRMAN. Well, I do not know how the Government could take it without paying damages, which, I can see, might be very high. Of course, it could do that. Then we would have, if your idea was carried out, that entire plant there, including the steam plant and everything, just kept in idleness in times of peace, to be prepared in time of war.

Mr. HAMMITT. Yes; but, understand, I would not recommend that as a policy to be continued after there has been developed some program for operating the plant that gave promise of being commercially successful, and you can arrange for that automatically to settle itself, because just as soon as anybody has developed a program for the operation of that plant, that they have reason to believe will be commercially successful, they will be prepared to negotiate with the Government for purchasing the plant.

The CHAIRMAN. Suppose they did that, the next thing they would do would be to put you out of business, and that would be just the same as if the Government put you out.

Mr. HAMMITT. It would be about the same in its effect, but we could not protest against that with any such grace, it seems to me, as we could protest against the Government violating its contract obligations with us and against the Government itself competing on an unfair basis against us; but if anyone can develop a manufacturing program that will succeed where we can not develop a manufacturing program that will succeed, then we certainly can not raise any protest against their putting us out of business.

The CHAIRMAN. Don't you think that if the Government operated it itself, it would improve the process the same as you probably will in your operations? I suppose you are looking towards improvements in it all the time, and is it not generally expected, since this is in its infancy, to a great extent, at least, that it is going to be improved and cheapened?

Mr. HAMMITT. I think no doubt that is true, and yet—

The CHAIRMAN. If the Government did it on its own initiative, it would avoid getting into the trouble that it seems to be in now with you, because if any private individual does it the first thing they would do is to patent it, and that means that the Government can not use it without the consent of the person getting the patent.

Mr. HAMMITT. Well, Senator, in order to get the benefit of all possible improvements it will not be necessary for the Government or anybody else to enter into a ruinously expensive operation of a plant of that size.

The CHAIRMAN. That is the only plant that the Government has? It has not any smaller plant?

Mr. HAMMITT. No; but it would be much cheaper for the Government, if it intended to carry on an experimental operation, even to go to the extent of building a separate plant to conduct it.

The CHAIRMAN. Well, that might be.

Mr. HAMMITT. Rather than to operate a plant of the size of that one at Muscle Shoals, and these improvements in the art, the real substantial fundamental ones, come as the result of a great deal of research, such research as the Government not only is capable of carrying out, but at the present time is actually engaged in carrying out under appropriations made under the provisions of the national defense act.

The CHAIRMAN. Well, has it not been the experience in connection with most improvements of this kind that necessity has brought them about? Take the matter of flying machines. Great improvements were made along that line during the war because they were necessary.

Mr. HAMMITT. Yes, Senator; but you must remember—

The CHAIRMAN. Now, is it not necessary to do something by way of giving to agriculture cheaper fertilizer? Do not all the people who depend upon the use of the products of agriculture almost of necessity have to have some cheaper way of getting them to the consumer?

Mr. HAMMITT. I would say that that is extremely desirable. I do not think we have reached the point where you can describe it as a necessity; certainly not in the sense—

The CHAIRMAN. Well, the soil is wearing out; we are not getting the kind of fertilizer that we ought to have, especially in the East and South. I think that is conceded, and it is also claimed that it costs too much.

Mr. HAMMITT. There is not any doubt that the price at which fertilizer can be sold has an important bearing upon the amount of fertilizer that is consumed.

The CHAIRMAN. Yes.

Mr. HAMMITT. But there are several other things that have such a bearing, and one of those things is the price at which the farm product is sold.

The CHAIRMAN. Now, do you think the Government of the United States is under any obligation to stay out of this fertilizer business for the benefit of its people simply because it might injure a corporation over in Canada that is dealing in the same product?

Mr. HAMMITT. Oh, no.

The CHAIRMAN. Even though it does give up money outside of what is necessary to operate it, and even though it does keep it up by means of a subsidy, regardless of whether that is a right thing as a governmental policy or a wrong thing? Has it not a perfect right to do that?

Mr. HAMMITT. I think when you speak of the Government operating this directly by itself, the Government is under no obligation not to do that. I believe the Government is under an obligation not to extend a subsidy to anyone else to operate this nitrate plant without first, under the terms of our contract with the Government, having offered that subsidy to us.

The CHAIRMAN. Of course, that is entirely a question of law, if that is valid, and I understand that is to be argued here. I do not know whether you are going to have anybody to argue it or not before the committee.

Mr. HAMMITT. No. As a matter of fact, Senator, we have felt that we ought not be put to the necessity of arguing that question as a legal question, because it has seemed quite clear to us the public policy, such as the committee would sustain, would be in favor of the Government living up to its written obligations, irrespective of whether those obligations might, by technicality, be held to be not legally binding.

The CHAIRMAN. I think there would be that kind of feeling with most people, if the contract were entered into without any shade of coercion having been used, or anything of that kind, if you did not take advantage of the Government wanting to do something, and if the contract was fair. I do not think that anyone wants to stand on legal technicalities, but is this one of the things that has been passed on by the lawyers of the War Department? Is this one of the things that they have said are null and void?

Mr. HAMMITT. There was not any opinion rendered by the Judge Advocate General on this particular contract, but a memorandum of the Judge Advocate General, which is included in the papers submitted to this committee by the Secretary of War, indicates that the Judge Advocate General would hold the same opinion regarding this contract that he holds regarding the Alabama Power Co. contract.

The CHAIRMAN. And he held that to be illegal?

Mr. HAMMITT. And he held that provision in the Alabama Power Co. contract to be invalid. Of course, we know that if the American Cyanamid Co., after entering into a contract in the course of its business operations, then sought to escape from a perfectly plain provision of the contract on the ground that it was invalid, very shortly it would be impossible for us to do business successfully in the United States, because nobody would want to deal with us, and if they did deal with us, they would deal with us only at arms' length.

The CHAIRMAN. Well, is not that true of most of us? In the run of business, corporations and individuals take advantage of every technicality they can in a contract, do they not?

Mr. HAMMITT. Quite to the contrary, Senator, and if any corporation does that—

The CHAIRMAN. Well, if you are right in that, the courts are fooling us, because they are trying lawsuits and arguing these technicalities, and those matters should be taken before a jury of Sunday school superintendents instead of having the courts pass upon them.

Mr. HAMMITT. Well, you would be astonished, Senator, at the relationship between the number of cases that might be brought to the courts and are not taken to the courts, and the number of cases that actually do get into the courts.

The CHAIRMAN. Is it not true that every one of these corporations has its lawyers employed by the year, and their duty is to keep them out of the courts sometimes by studying these technicalities and telling them in advance whether they had better go into the courts or not?

Mr. HAMMITT. That, of course—

The CHAIRMAN (interposing). You stay out of the courts not because you are not technical, but because you are, and you are able to tell in advance whether you stand any showing if you get into the courts.

Mr. HAMMITT. That is a precaution which, in writing contracts, corporations necessarily take, but it is not considered the usual and customary method of American business to attempt to escape from the provisions of a contract, because after the contract was written somebody has discovered they had not written it in a form that would be legally binding.

The CHAIRMAN. Let us take my definition and go back to your discussion of Mr. Ford's proposition. Your objection there was that there was just that kind of thing that might let Mr. Ford out, and if your definition of the business that the corporation that he has organized is going to run for 100 years is correct, it would not make any difference whether they can get out under that or not. They would say, "We offer to run it, and we are going to do so to full capacity; we do not care what the contract is."

Mr. HAMMITT. I was not trying to state, of course, my own objections, but to express my personal views for whatever value they might have to the committee.

The CHAIRMAN. And I was very glad to get your views.

Mr. HAMMITT. And what worried me about that or rather what I thought should worry you, Senator, regarding that Ford contract, was very largely the fact that there was absolutely nothing in the record or in the contract that plainly expressed precisely what it was Mr. Ford's intention to do.

The CHAIRMAN. I was very glad you went into that. You caused me to think a great deal about the representations that were made here. There is no doubt but what Mr. Ford's representatives have stated here and have left the impression here with this committee and with everybody, I think, that they are bound by their bid to operate that nitrate plant to its capacity. Of course, the particular technical phrases used there of the chemical that they are going to make might be, as you say, not as we understood it, but I am satisfied that we all got the same understanding, and would get it from a reading of it, although I can see from your explanation that you are right about the terms used. I do not understand them, and it would probably take a chemist to explain them. You might be right, and I was very glad to get your testimony on that.

Senator HEFLIN. Mr. Mayo, the chief engineer for Mr. Ford, testified, Mr. Chairman, that it was Mr. Ford's intention to use this 100,000 horsepower for manufacturing fertilizers.

The CHAIRMAN. Well, he was going to run this plant to capacity.

Senator HEFLIN. That he intended to use more horsepower than was set out in the contract.

The CHAIRMAN. Yes.

Mr. HAMMITT. That is a very different situation which will face this company long after those who participated in the making of the contract have passed away than it would be if in the contract itself, as in this contract of ours, there were plainly written down precisely what the parties to the contract believed they were agreeing upon, and the question comes up at a time when everybody who had anything to do with the negotiation of our contract on either side is available to the committee, and will undoubtedly tell the committee what was intended when that provision was written there.

The CHAIRMAN. Well, the universal law is that a contract, which is plain on its face, can not be explained by testimony of that kind. It is only when there is a doubt as to what the contract means that you can go back to find out what was meant by it.

Mr. HAMMITT. Here is a case where nobody raises any question. The only question of the Judge Advocate General is whether those who wrote that contract on behalf of the Government had authority to do so.

The CHAIRMAN. I suppose that is it. I do not know. I have not read his opinion.

Mr. HAMMITT. And, furthermore, in the case of Mr. Ford's contract, I should think the committee would be very much concerned by the fact that Mr. Ford's own statement regarding his intentions and the statements of his representatives before two committees of Congress differ so widely as to the intentions with regard to the manufacture of fertilizer and as to the intentions in regard to a thing which I will say to the committee is perfectly simple to write in the form of a definite and binding guaranty; providing you are first told exactly what it is you want to have guaranteed.

Senator HEFLIN. In the face of his contracts and the statements of his representatives here about the manufacture of fertilizer, there would not be any trouble about writing the right sort of a contract, if his offer is accepted, would there?

Mr. HAMMITT. If you are perfectly clear in your mind as to what it is he guarantees to do, I am sure you could write it into a contract; but if you do not know whether what he means is what Mr. Ford says to the Secretary of War, namely, "I will make fertilizer so long as it is profitable," or whether what he means is what Mr. Mayo says to the House committee, namely, "I will make the equivalent of 2,000,000 tons of 2-8-2 fertilizer," that is another thing again, or whether what he means is what Mr. Mayo testified to before this committee within the last two days, namely, that they have got a manufacturing operation that involves the manufacture of electric furnace steel and aluminum and working the fertilizer as a by-product, that is still another thing again. If you do not know which one of those different things that have been from time to time offered as being the intentions of Mr. Ford, are the things that actually represent his intentions, I should think you would have some difficulty in writing a guaranty.

Senator HEFLIN. I have one other question right there, Mr. Chairman.

You set out here in article 19 of your contract with the Government that if the Government shall cease this construction work at Muscle Shoals, and if it desires to dispose of this project it should give you the first opportunity to purchase it. When was this work stopped down there?

Major BURNS, can you tell us that?

Major BURNS. The construction was finished in the latter part of December, 1918. I should say—December or January.

Senator HEFLIN. Yes; but when was the work on the dam stopped? When did that cease?

Major BURNS. We carried that on until, I think, about the last of May a year ago, when the appropriation about ran out.

Senator HEFLIN. And the work has been stopped for a year?

Major BURNS. Just about; yes, sir.

Senator HEFLIN. Have you made any effort to buy this project from the Government, or had your company made any effort to do it?

Mr. HAMMITT. No, sir.

Senator HEFLIN. You have not?

Mr. HAMMITT. No, sir.

Senator HEFLIN. Nobody had made any effort to get it, as I understand it, until Mr. Ford made his offer, and now, as I understand you, you testify that the Government should not accept his offer, nor the offer of Mr. Engstrom, nor that of the Alabama Power Co.?

Mr. HAMMITT. Yes, sir.

Senator HEFLIN. And you have not any offer in yourself?

Mr. HAMMITT. That is all quite true, Senator.

Senator HEFLIN. What are you willing to pay for this plant No. 2, if you can get it?

Mr. HAMMITT. If you will not give us anything to boot, we are not prepared to pay anything for it, Senator.

Senator HEFLIN. Then, you would just let it stand there if you had your way about it, rather than to permit them to come into competition with you; you would let the dam stand as it is; you would prevent navigation on the river and you would let the whole thing stand still?

Mr. HAMMITT. Yes, Senator; and so would Mr. Ford, unless you would give him something to boot.

Senator HEFLIN. Well, he expects to make money out of it, of course.

Mr. HAMMITT. Not out of nitrates?

Senator HEFLIN. He said he would make 8 per cent on the fertilizers he produced, and Mr. Mayo said this morning, in response to a question asked by me, that he was going to manufacture fertilizer on a large scale, and after that,

in response to another question I asked him, as to how cheap they could produce it, he said that they expected to produce it at about half the cost required now in the production of fertilizer. If that is so, it will mean a saving of millions of dollars to the farmers of the country, and would it not be infinitely better for the Government to accept Mr. Ford's offer, so that these farmers will be benefited, and so that we can make that river navigable there for many, many miles, and manufacture fertilizer, in addition to having this plant ready for the manufacture of nitrates in time of war? Would not that be very much better than to permit it to stand still, as you suggest?

Mr. HAMMITT. Senator, if Mr. Ford has a secret process by which he can produce a marketable fertilizer at 50 per cent of the present cost of production, you would not have to give him a subsidy in order to get him into the fertilizer business, because Mr. Ford in that case would be governed by all of his ambitions to serve the farmers—

Senator HEFLIN. I think he thinks he has a secret process.

Mr. HAMMITT (continuing). As well as by his perfectly natural and proper and successfully proven ambition to make money, and he would go into the fertilizer business without any Government aid. But after Mr. Mayo had testified to the possession of this secret process I personally heard Mr. Mayo testify before this committee this morning that it was entirely possible, he might find this fertilizer plant a liability, and that that was a reason why it was impossible for Mr. Ford to pay more than \$5,000,000 for a certain amount of property. Now, we can not put together and make consistent the possession by Mr. Ford of a process by which he can cut cost of manufacture in half, with the fear of his chief engineer, who knows all about that process, that the plant that he gets from the Government for the use of that process may be a liability. It could not possibly prove to be a liability under those circumstances.

Senator HEFLIN. I understood him to say the other day that it might be necessary to expend millions of dollars to make the changes in Plant No. 2 with the process that they have got. That is what he meant when he said it might probably be a liability as it now stands.

Mr. HAMMITT. If you go to that extent in the alteration of Plant No. 2, I hope, in the interest of national preparedness in which, as an American citizen, I am really very much interested, that you will have plans submitted to the nitrate division before they are executed, because you will be in rather serious danger by so altering the plant that it will be no longer capable of manufacturing munitions of war.

Senator HEFLIN. But he does not intend to do anything that the Government would object to or would not approve.

Mr. HAMMITT. Some of the suggestions that have been made for the use of that plant for the manufacture of fertilizer would destroy the character of the plant as a nitrate-producing plant. If that plant were operated for the manufacture of electric furnace steel, with a fertilizer by-product—and it is no secret that there is such an operation possible—it would be necessary, in order to use the plant in that way, to change its character so it would no longer be capable of manufacturing munitions of war. If that plant were to be used for the production of alumina, with a fertilizer by-product, it would require certainly very extensive alterations. The fact is that there have been so many things—

The CHAIRMAN. Now, if it were used for alumina purposes, would that destroy its efficiency as a war proposition to make explosives?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. What is the by-product going to be—a nitrogen by-product or a potash by-product?

Mr. HAMMITT. In the case of alumina, it would be ammonia.

The CHAIRMAN. That by-product itself could be used as an explosive, could it not?

Mr. HAMMITT. By further processing it could be made into an explosive; yes, sir.

The CHAIRMAN. What would be the quantity of it?

Mr. HAMMITT. Well, my knowledge of that Serpek process is so extremely slight, Senator, I would rather not testify about it.

I would like to complete the answer here to your question. The by-product of the manufacture of steel would be a phosphate in the form of basic slag.

The CHAIRMAN. What about the quantity of that? Could you give us any idea as to that?

Mr. HAMMITT. Well, that would be, using Alabama pig iron, relatively small in quantity.

The CHAIRMAN. Of course, if we are going to transform this plant—and that is the reason I am asking these questions—into a plant for the manufacture of something else, with the explosive as a by-product, it becomes at once important to know what is going to be the volume of that by-product. If it is large it might pay to do it. If it is small, it would be foolish to do it.

Mr. HAMMITT. Senator, it seems to me, you want to go to the extent of knowing—you should find out what was going to be done with the plant—

The CHAIRMAN. Yes.

Mr. HAMMITT. And after ascertaining what was going to be done with the plant I think you should write it into the contract.

The CHAIRMAN. Certainly. Do not get the idea now—and I think I speak for all of the committee on this—that there is anybody here who wants to leave anything out of this contract that will have a tendency to make it clear. If we make a contract with Mr. Ford or with anybody else, we want to bind them up even though we might be willing to take the word of the man we are binding up.

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Just as completely as though we did not have any faith in his honesty; because whoever makes this contract, either for 50 years or a hundred years, is going to be dead before it is completed, and somebody else is going to carry it out and we do not know who that will be.

Mr. HAMMITT. Yes.

The CHAIRMAN. So that they must be bound by the contract just as completely as we can do it.

Mr. HAMMITT. That sounds to me like not only good public policy but good business judgment, Senator.

The CHAIRMAN. Well, nobody can ask the Government to do anything else. We can not enter into a contract that nobody understands, of course. That was the reason why I was very glad to have your testimony. You have given me rather a different viewpoint—I do not know whether it is right or not—of Mr. Ford's offer to operate this plant to its full capacity. There is a term used in his offer that the ordinary person would not understand. It is necessary to use those technical terms; but it may be that there is a way by which the licensee under that kind of a proposition would be able to escape doing what we all think his offer is—to run this plant to its full capacity for a hundred years.

Senator HEFLIN. Now, Mr. Chairman, since that has been called to our attention it is likely that we would be much more careful in the making of the contract and would see that there would be no doubt about that.

The CHAIRMAN. Oh, yes. If we make a contract with anybody we must make an effort to make one as to which there will be no doubt, of course.

Senator HEFLIN. Yes.

The CHAIRMAN. Now, Mr. Hammitt, what is the full name of the parent company?

Mr. HAMMITT. The American Cyanamid Co.

The CHAIRMAN. Where is it incorporated?

Mr. HAMMITT. In the State of Maine. Its main office is in the city of New York. The plants are located in New Jersey, Florida, and California, and Niagara Falls, Canada.

The CHAIRMAN. Niagara Falls, Canada, is the only place where you get nitrogen out of the air is it not?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Are these other plants operated by subsidiary corporations or by the American Cyanamid Co. direct.

Mr. HAMMITT. The one in California is operated and owned by a corporation of which the American Cyanamid Co. owns 50 per cent of the stock, and under a contract agreement votes 51 per cent. In other words, it receives half the profits and controls the company. The others are operated by the American Cyanamid Co.

The CHAIRMAN. What is the capital stock of the American Cyanamid Co.?

Mr. HAMMITT. Slightly over \$12,000,000.

The CHAIRMAN. All paid?

Mr. HAMMITT. Yes, sir; I mean that is the amount that is actually issued and out.

The CHAIRMAN. Well, is it all issued for equal value of property?

Mr. HAMMITT. All for equal value of property; the greater amount of it for cash at the amount of—

The CHAIRMAN. What was the idea of organizing the subsidiary to build this plant down there?

Mr. HAMMITT. There were two reasons for that. One was it was necessary for the Government to exercise the closest kind of supervision over every expenditure of funds, and, for that purpose, it was desirable that the expenditures and the accounts should not be confused with the ordinary business of the American Cyanamid Co. It made it a very much simpler auditing proposition for the Government. That is one reason, Senator.

The CHAIRMAN. Yes; all right.

Mr. HAMMITT. And there was another reason, that it was desired to avoid in an operation of this character, which involved the expenditure of \$100,000,000 before the signing of the armistice, endangering the assets of the American Cyanamid Co. In other words, there was a reason for creating that subsidiary corporation for the service of the Government, and there was a reason for the protection of the American Cyanamid Co.

Senator HEFLIN. The Air Nitrates Corporation is a subsidiary of the American Cyanamid Co.?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. I have not read this contract, and it may be that I am asking you something that is perfectly plain in it. You made a contract with the Government for the building of this plant?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. And this is the only contract you made with the Government in regard to this plant?

Mr. HAMMITT. That is the only one that the Air Nitrates Corporation made, except that there was a preliminary contract entirely superseded by this one. That is, there was a contract written dated in 1917.

The CHAIRMAN. When was this contract made?

Mr. HAMMITT. It was superseded by this, which is dated June 8, 1918. There was also a contract—

The CHAIRMAN. This plant was mostly built by that time, was it not?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Was it not about completed?

Mr. HAMMITT. Well, I said mostly completed. I spoke rather hastily, but the greater part of the construction work actually was done after that contract was signed, but a great deal of it had been done before it was signed.

The CHAIRMAN. Did this corporation complete what was there of the building operations?

Mr. HAMMITT. They did, subject to a very continual day-to-day inspection by the Government.

The CHAIRMAN. You were using Government money entirely?

Mr. HAMMITT. We were; yes.

The CHAIRMAN. And your corporation did not invest any money, did it?

Mr. HAMMITT. Theoretically, we did not. As a matter of fact, practically, there were times, of course, when we had to make expenditures for which the Government had not yet advanced the money.

Senator HEFLIN. What did the Government pay you or your company outside of the actual cost of this construction?

Mr. HAMMITT. The contract provided that we were to have a fee of \$1,500,000, of which fee they have paid us something less than \$1,200,000. Assuming that the entire fee of \$1,500,000 were paid, under the provisions of the war-profits tax law 80 per cent of it, or \$1,200,000, is paid back to the United States Treasury in the form of taxes.

The CHAIRMAN. In that respect you are just the same as everybody else that made the same amount of money, are you not; you are just paying your taxes?

Mr. HAMMITT. We are in the same position as everyone else who is in such a class that he is subject to that particular provision of the tax law.

The CHAIRMAN. Yes.

Mr. HAMMITT. Then, in addition to that, something slightly less than five per cent must be paid in taxes to the State of New York, and that leaves \$225,000 out of the fee. Now, without compensation other than in this fee, Air Nitrates Corporation was required to furnish to the Government the services of a group of men in whom there resided at that time to a greater extent than any other group of men the knowledge and the experience and the ability to design and construct this kind of a plant, and the compensation of those men was paid out of private funds as a part of the agreement under this contract, and was not charged to the Government.

Senator HEFLIN. How many men did you have down there.

Mr. HAMMITT. Ten men.

Senator HEFLIN. For how long.

Mr. HAMMITT. Wait a minute. I answered your question a little too early, Senator. Do you mean how many men were engaged in the work on Muscle Shoals?

Senator HEFLIN. No; I mean how many did your corporation furnish, and how long a time were they down there in the construction of this plant.

Mr. HAMMITT. Air Nitrates Corporation furnished to the Government without charge other than as that charge is involved in the fee, the services of ten men, whose entire time over a period of from fifteen to eighteen months was devoted to this work. They were, some of them, at Muscle Shoals during a part of that time, and some of them were elsewhere, but they were engaged upon the work of the designing and construction of this plant, a good many parts of which extended to all corners of the United States, of course.

The CHAIRMAN. These ten men were working with experts of the Government, were they not? You were experimenting somewhat as to just what could be done in the way of machinery and the processes that could be used, and trying to improve it, were you not?

Mr. HAMMITT. No, Senator; the entire process was a proven thing, except for—

The CHAIRMAN. Well, was not the process changed somewhat in the course of the construction of this plant?

Mr. HAMMITT. Not the cyanamid process. I did not quite complete my other answer. I would say the entire process was an entirely proven thing, with the exception of certain features of the last end of the process, as to which we had adequate experience upon the basis of which we could set up something which we were perfectly sure would work. In other words, it was never an experimental thing from the start to the finish. We knew exactly what we wanted to do, and it was simply the details of the work in designing, such as you would have in the building of any large manufacturing plant.

The CHAIRMAN. Was there not, in the course of the construction of the plant there, investigation continually going on between your men and the Government's scientific men with regard to the process, with a view to improving it, and did you not improve it somewhat during that time?

Mr. HAMMITT. I am not aware of any such developments, Senator.

The CHAIRMAN. Is there anything in this contract that provides—or if it is not in this contract is it in the other contract that you had with the Government—your scientists and the Government scientists, in working together and developing new improvements in the process, that if they should be developed, even by the Government's men that the Government had there, you should be entitled to get it patented and get the benefit of it, so that you would have a monopoly of it afterwards in any other plant?

Mr. HAMMITT. No. There is a provision by which any development of that character by any of the employees of Air Nitrates Corporation, who, of course, were the only employees on that job that were paid out of the Government Treasury, that for any such developments by them there should be granted a license to the United States Government.

Senator HEFLIN. What business were those 10 men engaged in before they went down there to do this work?

Mr. HAMMITT. The cyanamid business.

Senator HEFLIN. What salaries were they getting per year?

Mr. HAMMITT. Well, I could not, offhand, give you a complete list of the salaries of the 10 men, Senator.

Senator HEFLIN. Well, the average?

Mr. HAMMITT. They were compensated in a total in all the different forms of compensation they received out of private funds to an amount slightly in excess of the balance of our fee after we paid taxes. Those 10 men have received compensation in greater amount for a similar period from the same private funds since the war.

Senator HEFLIN. Well, about what salary were they getting on the average, would you say, at the time they went down there?

Mr. HAMMITT. I would say the average compensation for such a period as this work required was \$25,000 a year.

Senator HEFLIN. And under this fee paid by the Government they received over \$75,000?

Mr. HAMMITT. No, sir; they received no compensation of any character from the Government.

Senator HEFLIN. I mean, you furnished 10 men and they superintended this work and the Government has already paid you \$1,200,000 fee for that service rendered?

Mr. HAMMITT. Well, as I stated, our expenditures under that contract—necessary expenditures—exceeded the total amount that we have received, or will receive, from the Government; so that when the books are entirely closed on the operation we will have netted an actual cash loss in connection with the service that we rendered to the Government.

The CHAIRMAN. What you got out of the Government you more than used in paying salaries, then?

Mr. HAMMITT. Yes; and in addition to that there were a good many expenditures necessary to be made on that job that the Government did not reimburse and undoubtedly many which they never will reimburse.

The CHAIRMAN. This plant was operated for a while, was it not?

Mr. HAMMITT. It was.

The CHAIRMAN. How much did you get in the way of royalties? Have you counted that in?

Mr. HAMMITT. Yes. Our royalties and operating fee for the period of operation amounted in total to about \$15,000.

The CHAIRMAN. How long did you operate it?

Mr. HAMMITT. It was an intermittent operation that extended over a period of several months.

The CHAIRMAN. Well, the Government paid all of the expenses of that operation, did it not?

Mr. HAMMITT. Yes.

The CHAIRMAN. Was not that a clear profit that you made then; that \$15,000?

Mr. HAMMITT. I have included that in.

The CHAIRMAN. In your other items?

Mr. HAMMITT. In my statement, the net result of which is that all the money we have received is not equivalent to the money that we have paid out, after the books are entirely closed on the operation.

The CHAIRMAN. But the greatest bulk of that is because you are liable for taxes?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. And the fact, as you say, that you paid 80 per cent shows that your income was so great that you were paying a tax under the highest brackets of the excess profit tax?

Mr. HAMMITT. No; it was the war profit tax.

The CHAIRMAN. Well, the war profit tax.

Mr. HAMMITT. And the reason that we paid 80 per cent was because more than 50 per cent of the business of the Air Nitrates Corporation was Government business during the war, you see.

The CHAIRMAN. Yes.

Mr. HAMMITT. That is one of the effects of the creation of the separate subsidiary corporation.

The CHAIRMAN. Or you might say it is one of the effects of the taxation, that the Government had to get some money to conduct the war or the profiteers could not have made anything, and they had to ask you and somebody else to do it.

Mr. HAMMITT. And we have not the slightest complaint, of course, nor do we think there is anything unjust in the fact that we came out of this operation without a profit. The Government, as a matter of actual fact, did not get any nitrates from this plant that were actually used in the war. The purpose for which the plant was designed was to supply something in a campaign of the year 1919. We never had the campaign and we never used the material.

The CHAIRMAN. Of course if it had been known that we were not going to have the campaign we would have saved that money.

Mr. HAMMITT. Precisely.

The CHAIRMAN. That is a part of the expenses of the war.

Senator HEFLIN. Do I understand you to say, aside from the tax question, that you expended money down there in connection with the construction of plant No. 2—

Mr. HAMMITT. Which was not reimbursed.

Senator HEFLIN (continuing). Which was not reimbursed by the Government?

Mr. HAMMITT. Yes, sir.

Senator HEFLIN. How much was that?

Mr. HAMMITT. I can not tell you how much, but as a matter of fact the matter has not been entirely settled yet.

The CHAIRMAN. Are you not entitled under this contract to reimbursement for anything of that kind?

Mr. HAMMITT. Questions arose like this, Senator: Some of these items that have not yet been reimbursed include advances that were made to our employees in order that they might be able to purchase meals in the mess halls when they first arrived on the job, which advances theoretically were to be collected out of the wages of those employees. Some of the men left the job before they had earned wages enough to pay these advances. That is one class of item that exists in that list. Now, undoubtedly the Government can reimburse some of these expenditures. Undoubtedly there are some of these expenditures that the Government can not reimburse, and that sort of thing is incident to every such job.

The CHAIRMAN. Yes.

Mr. HAMMITT. And I think perhaps we were exceedingly fortunate in being able to handle this job with a minimum amount of that sort of thing.

Senator HEFLIN. Have you made a demand on the Government for the reimbursement of these funds?

Mr. HAMMITT. We have submitted all of these accounts, and they were disapproved by the director of construction, and we have the question pending. It has not been pressed by us with any great degree of vigor with the War Department for the collection of all that we can collect, or what has not yet been paid. We have not pressed it simply because it is a considerable amount of detail and it just has not gotten to the point yet where we have pressed it. I have no doubt that the remainder of the fee will be paid, and I have no doubt that some of these other expenditures will be reimbursed. I have no doubt that all of them will not be reimbursed.

Senator NORBECK. I want to ask you one more question. Referring to this tax you speak of, is that the tax of the subsidiary corporation that constructed the plant?

Mr. HAMMITT. Yes, sir; and the fees are paid to the subsidiary corporation.

Senator NORBECK. Yes.

The CHAIRMAN. Of course, the contract was made with the subsidiary corporation. As far as the Government is concerned, it has not any contract with the parent corporation.

Mr. HAMMITT. That is not quite true, Senator, because this license agreement—

The CHAIRMAN. Oh, yes.

Mr. HAMMITT. Was made.

The CHAIRMAN. Let me make this statement here: I asked you a question a little while ago that rather insinuated that you had some contract with the Government by which the Government employees, if they discovered anything new, it would be utilized by the company, and that the company would have a right to patent it. I knew that such contracts had been made. I knew something about them and had made some investigation of them, but I am informed by Major Burns that I was mistaken as to such a contract being made with your company. It was with another company entirely, a company with which you have nothing to do; so, to the extent that that question implies that I had knowledge that you had such a contract—and I would not consider it very honorable—I offer this explanation as an apology. If I had known the facts, I would not have asked the question.

Senator HEFLIN. Mr. Chairman, in order to get that matter covering the fee clear, I want to ask the witness a question.

Do you mean to say that the Government has paid you in money a fee of \$1,200,000?

Mr. HAMMITT. Slightly less than that.

The CHAIRMAN. Well, around that?

Mr. HAMMITT. Yes.

Senator HEFLIN. Over a million dollars?

Mr. HAMMITT. Yes, sir; pretty nearly \$1,200,000.

Senator HEFLIN. Then you said that you have been out more than that amount?

Mr. HAMMITT. Yes, sir.

Senator HEFLIN. Can you state in what way you lost this money?

Mr. HAMMITT. Well, the greater part of it—

Senator HEFLIN (interposing). What you did that caused you a loss in excess of that which the Government paid you?

Mr. HAMMITT. The largest two items, Senator, constituting the greatest part of it, are, first, taxes—

The CHAIRMAN. That is 80 per cent.

Mr. HAMMITT. Yes; as a matter of fact it is nearly 85 per cent when you include the State taxes; and, second, the compensation of these men whose services we were required to furnish, and paid for, but under the contract were not to be reimbursed for by the Government.

Senator HEFLIN. Do you mean you paid the taxes out of this money that was paid to you by the Government?

Mr. HAMMITT. Yes, sir.

Senator HEFLIN. And you were not to charge anything for the time and skill of the men you furnished?

Mr. HAMMITT. For those 10 men, no. That is covered very specifically in the contract. It is referred to in article 4 of the contract, on page 26. That is the license agreement. It is also referred to in the contract, in article 10, page 11, in the following language:

"The agent shall make no charge to the United States for the following things:

"1. For procuring from the American Cyanamid Co. a license to it as agent of the United States to use the said company's patents and processes.

"2. For procuring from the American Cyanamid Co. the disposal, for purposes of the Air Nitrates Corporation, of the said company's experiences, records, and plans appertaining to the production of the said chemicals hereinabove referred to.

"3. For procuring from the American Cyanamid Co. the disposal for the purposes of the Air Nitrates Corporation of the following members of the said company's executive and technical force, namely, the president, vice president and general manager, sales and traffic manager, engineering assistant to general manager, superintendent of manufacture, chief technologist, chief engineer, assistant engineer, and in addition thereto, in connection with the operation of the said plants, two principal works managers, as such offices may from time to time be filled.

"4. For procuring from the American Cyanamid Co. the disposal, for the purposes of the Air Nitrates Corporation, of all of the said company's plants for the purpose of training superintendents, foremen, and chief operatives."

Now, the only item in that list of four services to be furnished without charge, to which I have made reference, and the only item that involved a substantial and discoverable expenditure of money, is the delivery of the services of these 10 men, and those services cost money, and that money constitutes a substantial item. The Air Nitrates Corporation paid it and had to take it out of what was left of its fee, and when they did, there was not anything left of the fee.

The CHAIRMAN. Well, did they devote all of their time to this plant?

Mr. HAMMITT. Yes, sir; they did.

The CHAIRMAN. I wonder, if we analyzed it, would it be found that these same people owned the principal stock of the company?

Mr. HAMMITT. It would not; no, sir.

The CHAIRMAN. Would it be found that they were getting a different salary during this time than they got before or have been getting since from their company?

Mr. HAMMITT. No, sir. Their compensation was on no more favorable basis during that period of time than it was prior to that time. There were a few instances in my present knowledge where their compensation has been on a more favorable basis since.

The CHAIRMAN. What salary does the president of the company get now?

Mr. HAMMITT. The president's compensation is in the form of a salary plus an arrangement in regard to a division of earnings, and the salary itself is \$25,000 a year.

The CHAIRMAN. And in addition to that he gets a per cent of the earnings of the company?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. How much?

Mr. HAMMITT. After a certain amount of deductions have been made. I wonder if you want me to put all that in.

The CHAIRMAN. Well, I do not know that it is necessary.

Senator NORBECK. I do not think it has any bearing on this. The Government did not pay these salaries. They were paid by the company.

The CHAIRMAN. I do not think so. I asked the question because you were saying that they had not made any money.

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Of course, if they were the principal stockholders of the company it would not make any difference whether they were getting it in the shape of a salary or in any other way. If they were getting a big salary they were paid it, anyway.

Mr. HAMMITT. Yes.

Senator HEFLIN. It would have some bearing on the cost of fertilizer, Mr. Chairman.

The CHAIRMAN. Yes.

Senator HEFLIN. The paying of these big salaries to their officers.

Senator NORBECK. It has been my experience that the high-priced man is often the cheapest man.

The CHAIRMAN. I think you can go to extremes either way. I would hate to be classed as a cheap man myself, but I do not get a large salary.

Mr. HAMMITT. There are, of course, some of these men, Senator—and I want to be sure that I have not created a wrong impression on the record—there are some of these men who are stockholders in the American Cyanamid Co. Of course, all of the stock in the Air Nitrates Corporation was owned by the American Cyanamid Co., and there is just one stockholder.

The CHAIRMAN. Yes.

Mr. HAMMITT. But there is no one of these men, nor the whole group of them together, that owns, I should say, more than 5 or 6 per cent of the stock of the American Cyanamid Co.

The CHAIRMAN. The stock is pretty widely distributed?

Mr. HAMMITT. Yes.

The CHAIRMAN. There is a good deal of it owned abroad, is there not?

Mr. HAMMITT. No; there is probably between 10 and 15 per cent of the stock owned abroad.

The CHAIRMAN. When I say "abroad"—

Mr. HAMMITT. I mean in all foreign countries.

The CHAIRMAN. That includes Canada?

Mr. HAMMITT. That includes Canada; yes, sir.

The CHAIRMAN. Of course, it is possible that by this arrangement these officers get a salary and then a per cent of the income, and it never would be possible for the company to pay any dividends to its stockholders for that reason.

Mr. HAMMITT. No; because before they ever share in the earnings the net earnings must be sufficient to pay these dividends.

The CHAIRMAN. As I understand the contract, it provided that, on your part, the Air Nitrates Corporation should, with the Government's money, construct this plant, that you should build No. 2, that the Government furnish the money and you furnish the plans and specifications. Did you do that for all the buildings?

Mr. HAMMITT. Yes.

The CHAIRMAN. And you managed the construction of it?

Mr. HAMMITT. And assembled the organization and supervised the construction.

The CHAIRMAN. Yes; and supervised the construction.

Mr. HAMMITT. Yes.

The CHAIRMAN. For that, under the contract, you were to be given a fee of \$1,500,000, were you not?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Then you were given a royalty on everything that was made there in that plant?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. And if the plant had been operated, as was contemplated at the time both by your company and by the Government, you would have received very substantial sums in the way of royalties, would you not?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. That did not pan out, because the war stopped.

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Now, did you get any other fee besides the royalties?

Mr. HAMMITT. Yes. We would have received during that operation—that is, when the Air Nitrates Corporation was operating the plant—we would have also received an operating fee.

The CHAIRMAN. An operating fee?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. You did not make the money you expected to make on it because the war ended, and that was the only reason you did not make it, is that it?

Mr. HAMMITT. That is quite true, Senator.

The CHAIRMAN. In addition to that, you—

Mr. HAMMITT. That is the only reason we came out with a loss on the operation.

The CHAIRMAN. Yes. And in addition to that you had put into the contract that if the Government sold this property it was to give you the opportunity of being the first one to purchase?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Now, under ordinary circumstances, if it had been operated, you would have been fully compensated for all of your efforts, even without section 19, which provides for the purchase clause, and you did not make the money out of it that you expected to, because, simply, it never was operated, and everybody was glad, of course, because the war was over, and you did not have to operate it. How much, under this contract, are you to get if this thing is operated to its capacity, in the way of royalties?

Mr. HAMMITT. We would have received royalties during the war on one basis and after the war on a different basis.

The CHAIRMAN. Yes. Give it to us on both bases.

Mr. HAMMITT. The war royalties were 6 mills per pound of nitrogen fixed in the form of lime nitrogen. That is a little complicated, but I will explain that in just a minute. On the basis of postwar royalties it was 1½ cents per pound of nitrogen fixed in the form of lime nitrogen. The first form in which nitrogen taken from the air is fixed in that process produces a material which was referred to in this contract as lime nitrogen, and it is generally described as either lime nitrogen or crude cyanamid, and it was from a measure taken at that point of the amount of nitrogen fixed that these royalties were determined. Then the Government would direct what further processing there would be after that and ultimately that nitrogen would come out in the form of ammonium nitrate, or, if the Government made another decision, in the form of some other kind of nitrogen.

The CHAIRMAN. Now, tell us if the plant had been operated a year to its capacity during the war—

Mr. HAMMITT. Yes, sir.

The CHAIRMAN (continuing). How much you would have received in the way of royalties.

Mr. HAMMITT. We would have received approximately \$480,000 in royalties annually.

Senator HEFLIN. How much operating fee?

The CHAIRMAN. I am getting at that, Senator.

Senator HEFLIN. All right.

The CHAIRMAN. \$480,000. What would have been the operating fee for that year?

Mr. HAMMITT. The operating fee would have been approximately the same amount.

The CHAIRMAN. \$480,000. Now, is there any other kind of fee that you would have received?

Mr. HAMMITT. Assuming that you are not now considering the construction fee heretofore mentioned, there would be no other.

The CHAIRMAN. What would you have been compelled to expend in the way of operation there? What would you have supplied?

Mr. HAMMITT. We would have supplied simply these—

The CHAIRMAN. These men that you have enumerated before?

Mr. HAMMITT. So far as the things we would have supplied would have required out-of-pocket expense during that year, we would have supplied only the service of these men.

The CHAIRMAN. How many men?

Mr. HAMMITT. Ten.

The CHAIRMAN. Ten men?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. What would have been their combined salaries?

Mr. HAMMITT. Well, my recollection is, Senator, that their combined compensation in a normal year would be about \$160,000.

The CHAIRMAN. \$160,000; and then, as a matter of fact, those men get on an average of \$16,000 a year apiece; and one of them is just a workman, is he not?

Mr. HAMMITT. Oh, no.

The CHAIRMAN. An expert workman, of course.

Mr. HAMMITT. No.

The CHAIRMAN. But there are two of them, I think——

Mr. HAMMITT. No; there is not a single man on that list who is not a highly trained man.

The CHAIRMAN. What is the lowest salary of any one of them?

Mr. HAMMITT. I can not tell you from recollection, Senator.

The CHAIRMAN. Taking them at their maximum, and say \$160,000, it would have left you, then——

Mr. HAMMITT. That is not their maximum. That is my recollection of what the compensation of those men would have been prior to the war.

The CHAIRMAN. That would have left you a profit in a year, without any financial investment whatever, of \$800,000. Now, let us figure the same thing on a peace basis. What would you have made in a year if they operated it when the war was not going on? It would have been somewhat less than that?

Mr. HAMMITT. No, sir; it would have been more than that.

The CHAIRMAN. Would it?

Mr. HAMMITT. The royalty would have been adjusted to something more nearly an ordinary basis. This royalty during the war figures out on a ridiculous basis, Senator, so far as royalties are ordinarily computed.

The CHAIRMAN. It looks to me like a comfortable sum there. I do not know; maybe you would get poor at it; but \$960,000 a year, without any investment in money, is a pretty good thing.

Mr. HAMMITT. Of course, if you license a manufacturing company to operate under a process in which you have invested a considerable sum of money, while you have not got an out-of-pocket expense in connection with their operation, you have got something for which you are entitled to ask compensation.

The CHAIRMAN. Yes, certainly; I agree with that.

Mr. HAMMITT. And that compensation, ordinarily, in my experience with royalty matters, runs somewhere around 10 per cent of your selling price, when it is a controlling patent.

The CHAIRMAN. This is really coming to you because of the use of your patents, is it not?

Mr. HAMMITT. Yes.

The CHAIRMAN. That is the foundation for that.

Mr. HAMMITT. Yes; that is the foundation of the royalty fee.

The CHAIRMAN. Yes. Of course, you ought to recognize that the Government gave you this monopoly in the way of a patent for about \$50 or \$60 to begin with.

Mr. HAMMITT. No; I do not realize anything of the sort, Senator. I do not think you really mean that; because what the Government gave us for our fees and the expense of obtaining patents, which, of course will run into not a very substantial sum, but some of them very much more than \$50 or \$60——

The CHAIRMAN. I mean for each patent. I do not know how many you have.

Mr. HAMMITT. Was the right to have protected under the general law those developments in the art for which we have expended actually millions of dollars.

The CHAIRMAN. Maybe you did, but usually the fellow that really does the work on a patent does not get anything. The fellow that gets it patented gets the money, but the man who actually does the inventing dies in the poorhouse. That is what usually happens.

Mr. HAMMITT. That is unfortunately very frequently true.

The CHAIRMAN. But the Government does give you a monopoly, and I am not complaining about it. You have a right to get it; but here is a case where it gave you a monopoly on certain patents and when it wanted to use them itself you charged the Government, which you had a right to do, with a view to making a profit during the war in addition to your other fees; so it was not a charitable proposition that you were doing for the Government, even though, as it turned out, you were not making any money.

Mr. HAMMITT. In my testimony I do not want you to think that I ever contended that this was entirely a charitable operation. I have not made any

such contention. What the Government would have saved on that operation in one year, if it had taken place, Senator, just taking the difference between the Government fixed price of ammonium nitrate and the Government fixed cost of producing nitrate at Muscle Shoals, based upon their actual test runs, with green men, would amount to a saving of \$15,000,000 a year.

The CHAIRMAN. No; I do not see it.

Mr. HAMMITT. The fixed price of ammonium nitrate was \$300 a ton. That was the Government fixed price of ammonium nitrate. The ammonium nitrate actually produced at Muscle Shoals cost \$169 a ton.

The CHAIRMAN. Well, you do not mean to say now, do you, that because the fixed price was \$300 a ton that your company would be entitled to all the credit, if it got it for less than that?

Mr. HAMMITT. I mean to say that the thing we gave to the Government was not on the basis of a charitable operation, as you said.

The CHAIRMAN. I mean you sold it to the Government and you got paid for it.

Mr. HAMMITT. Now, we are discussing the question of whether or not the compensation was reasonable, are we not, Senator, and I am saying that if we were dealing with anything except a war service, we certainly would have been better traders than to have accepted that amount of compensation from a purchaser who was getting that amount of benefit.

The CHAIRMAN. Of course, that is a question of policy. There could be a great deal said on the side that the Government ought to be able to use for its own use at any time anything that it has given as a monopoly to somebody else by way of a patent; but there is not any question of law, and of course, I am not contending that there is. You are entitled to whatever reasonable arrangement you can make, and I am not saying that you made an unconscionable one, but certainly it looks to me as if in this contract you were well provided for. Because you did not make a lot of money out of it was not your fault, nor the fault of the contract, either.

Mr. HAMMITT. The reason we did not make any money was because the armistice was signed.

The CHAIRMAN. And you had to pay your taxes. Of course, we all had to do that. I did not make any money that same year myself. On my enormous salary of \$7,500, I ran a little behind in that year. If we are going to have war, we must pay for it. If we want to dance we have to pay the fiddler. Somebody has to do it. If it takes a 100 per cent of a man's income, he has to stand for it, put it up and look happy.

Mr. HAMMITT. I agree with all of those statements, Senator.

The CHAIRMAN. Now, I wish you would give us the figures for the record on what your income would be in one year under this contract in the shape of royalties, if the plant were operated for one year to its capacity.

Mr. HAMMITT. The gross income would be about \$480,000. I have given you that before, Senator. Oh, you mean in times of peace.

The CHAIRMAN. Yes, that is what I want. You have given it to us in war times.

Mr. HAMMITT. Yes.

The CHAIRMAN. Your royalties were \$480,000, you said.

Mr. HAMMITT. Yes; you are right, \$480,000.

The CHAIRMAN. That is in time of war?

Mr. HAMMITT. Yes.

The CHAIRMAN. Now, in time of peace it would be more than that.

Mr. HAMMITT. Yes.

The CHAIRMAN. How much would it be?

Mr. HAMMITT. \$1,320,000.

The CHAIRMAN. Now, if we were to accept the bid of Mr. Engstrom, for instance, or Mr. Ford, or if we were to put the bill through that I have introduced, and the Government operated this through a Government corporation, we would have to pay you under this contract in the shape of royalties, \$1,320,000 per year, would we not?

Mr. HAMMITT. Subject to arbitration; that is, Senator, there is a provision in this contract that if either party considers that royalty unreasonable, he can have it arbitrated.

The CHAIRMAN. Does that apply to war and peace times, both?

Mr. HAMMITT. No; that applies only to the peace time royalty, but it applies to this \$1,320,000.

The CHAIRMAN. Now, let me get clear another item that seems to be mixed up here. On this peace-time operation you are not required to furnish the men?

Mr. HAMMITT. No; not unless—

The CHAIRMAN. Well, they would have to make some other arrangement for it?

Mr. HAMMITT. Yes.

The CHAIRMAN. They would have to pay for it, in other words, but what I am getting at is this: This royalty of \$1,320,000 is net to you, no matter who operates it, just so it is in times of peace.

Mr. HAMMITT. There is no out-of-pocket expense against it, of course. Ordinarily, really, any royalty is net.

The CHAIRMAN. No; you have expressed it fully when you say that. That is what I meant by "net." I do not know whether I used the right term or not.

Mr. HAMMITT. Although I stated subject to arbitration. I would like also to state that, in my personal judgment no arbitration would reduce it. The reason I speak that way is that I do not believe it is an unreasonable royalty.

The CHAIRMAN. Of course, it would stand in the way of any operation that had to be conducted. It seems to me, though, that your corporation is very well protected by this contract under any possible contingency. Now, your company's grasp or control of the situation in the fertilizer proposition would seem to be almost a monopoly.

Mr. HAMMITT. We had an absolute monopoly, of course, of the cyanamid process until the war came along, and we could have provided the Government with this plant, operated it for the Government during the war, and still it would not be necessary for that monopoly, necessarily, to be interfered with or broken after the war. In other words, no war service required that we should part with any part of that monopoly, but to whatever extent we have parted with that monopoly that is just something it has cost us to go into this Muscle Shoals operation.

The CHAIRMAN. What I am thinking of particularly is the fertilizer proposition, the use of this plant in times of peace. To what extent does your company control the fertilizer markets of the country now?

Mr. HAMMITT. We are very small factors in the fertilizer industry, Senator.

The CHAIRMAN. Could you give us an idea of about what per cent of it comes through your various corporations?

Mr. HAMMITT. Perhaps not more than 1 per cent.

The CHAIRMAN. Well, it looks to me, then, if you are so small a factor in the fertilizer proposition, you are unduly alarmed, and that as a financial proposition, you could better afford to have the Government either operate this plant or have somebody else operate it and get this royalty out of it than you could to have your profits on the fertilizer, unless you get an enormous profit on your fertilizer interests. You stand to make, if the Government operates this plant, or if anybody else operates it, and this contract is held to be good, \$1,320,000, without any further investment or without any risk whatever, and whatever you make outside of that, of course, is extra for your corporation. Why is it you are so anxious that this should not be operated and you should be deprived of this \$1,250,000, in round figures?

Mr. HAMMITT. Well, I hesitate to talk for a public record on one phase of that problem, Senator, which is based on the general fact that the collection of royalties, even when they are firmly owed sometimes requires a considerable amount of very costly and somewhat hazardous litigation.

The CHAIRMAN. But you do not anticipate that in this case, do you?

Mr. HAMMITT. I hope that we would not have any such experience, and yet if, when we enter, as we did, into this kind of a contract with the Government, and then have to argue a case afterwards as to whether that provision of the contract with the Government, and then have to argue a case afterwards as to whether that provision of the contract with the Government itself should be adhered to, it gives us a little bit of doubt as to whether dependence upon our rights to collect may mean anything whatever except dependence on our ability to enforce our rights in litigation.

The CHAIRMAN. Suppose Mr. Ford gets this contract—let us take his case now—and he buys this plant under his arrangement, and he starts manufacturing there to its capacity. Have you any doubt that you have a legal claim against him that would enable you to collect every year the sum of \$1,300,000?

Mr. HAMMITT. Well, I think ultimately we would collect that \$1,300,000.

The CHAIRMAN. In other words, if you are satisfied with this contract, and you think it is all right in every respect, why are you afraid?

Mr. HAMMITT. I am not in the least bit afraid, Senator, of the ultimate result, but I think one of the things that are generally understood regarding Mr. Ford, for example—and this, no doubt, has a very great importance in the general discussion—is that one of the things he definitely does not believe in is patents and the general understanding is that if you collect royalties from Mr. Ford, as some people do, you collect them only after you have thoroughly established, beyond any shadow of doubt, your right to that royalty in the courts.

Now, I do not believe that Mr. Ford would operate this plant to capacity continuously. I believe that there would be one or another thing that would happen down there at that Muscle Shoals plant, that would begin with the placing upon the market at less than cost of production a considerable quantity of a fertilizer material which would cost Mr. Ford some money to do that, and it would cost us money to meet that situation. It is, as I say, a question of business judgment as to whether these royalty provisions offer us adequate protection, and we do not believe, as a matter of business judgment, that they do, and so we ask for that protection which is provided for in the contract that we wrote with the Government.

The CHAIRMAN. Now, that means that you want an opportunity to buy it; you want the first opportunity?

Mr. HAMMITT. We do; yes, sir.

The CHAIRMAN. And yet you say the plant is of no account unless there is something thrown in with it?

Mr. HAMMITT. But we want the something thrown in also, Senator.

The CHAIRMAN. I know you do. It must follow now that you think there is an awful lot in it, or it must follow that you are making enormous profits in your fertilizer business when you say you would make less than 1 per cent on it, because you are going to get, if your contract is good, which you think it is, \$1,320,000 a year, if somebody else gets it; so you must think that there is more than \$1,320,000 a year in it for you if they do not get it.

Mr. HAMMITT. I do not think, Senator, that there is going to be a continuous capacity operation of that nitrate plant under Mr. Ford's offer or under any other proposal, and I do not think there is any good business judgment back of depending upon the continual collection of \$1,320,000 out of a losing manufacturing operation. It would seem to me to be very poor business judgment to expect that.

The CHAIRMAN. If he does not operate it that is just what you want.

Mr. HAMMITT. I think there will be a stab made at that operation, and I think there will probably be a considerable amount of production, and there will probably be a considerable amount of litigation that will arise out of—

The CHAIRMAN. I would like to see him operate it if I were you, because I would get that \$1,320,000.

Mr. HAMMITT. I have also indicated, Senator, that I have considered the Ford contract as outlined by him as an exceedingly valuable contract.

The CHAIRMAN. I know you have.

Senator HEFLIN. In other words, if the Government decides that it will accept Mr. Ford's offer, you say, "Now, if you are going to do that, we are ready to take it." Is that your contention under your contract?

Mr. HAMMITT. Yes, sir; that is our interpretation of the provision of the contract.

Senator HEFLIN. Yet you stated this morning to the Chairman, as I understand you, that plant No. 2 was worth at least \$15,000,000 now as it stands.

Mr. HAMMITT. No; I gave a hasty and very rough estimate of the scrap value, which I think came to about \$15,000,000 for all of that property down there covered in the Ford offer, other than the dams.

Senator HEFLIN. That includes land and houses on the lands?

Mr. HAMMITT. It includes plant No. 1. It includes the Government interest in the Gorgas steam-power plant, and includes the transmission line property.

The CHAIRMAN. And plant No. 2?

Mr. HAMMITT. And plant No. 2.

The CHAIRMAN. All the land around there with the houses and buildings?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Whatever they may be, but it does not include, Senator Hefflin, the dams or any of the houses connected with the dams. There are a good many buildings up there, you know.

Senator HEFLIN. Yes.

The CHAIRMAN. Yes. He said that the scrap value of it would be \$15,000,000. Personally, without having an expert to look it over, and seeing all of those

buildings and everything that there is there, it seems to me that you have it low. I think it is more than that.

Mr. HAMMITT. Well, I thought it over and discussed it somewhat since my testimony this morning, and I think I would change that testimony somewhat and say instead of that that was a fair estimate, it is a modest estimate. I would not want to change my statement any more than that.

Senator HEFLIN. Now, if Congress decides to accept Mr. Ford's offer, and then you come in and under your contract are permitted to take it off the hands of the Government at that amount, what would you do with it?

Mr. HAMMITT. Why, Senator, I think maybe we would see if we could not find some way of getting introduced to Mr. Ford's secret process.

Senator HEFLIN. You would get hold of his secret process?

Mr. HAMMITT. I think we might want to be introduced to his secret process if we were placed in that position; but the thing that impresses me, Senator, is that if it were held out as compensation for doing a difficult thing, that you were prepared to give that water power to them, and if the Government financed it on the kind of terms that Mr. Ford has proposed, it would be a tremendously valuable thing.

Senator HEFLIN. Oh, yes; if you were to take it off the hands of the Government, you would want it at the amount that we would agree to let Mr. Ford have it, without the stipulation that you were going to manufacture fertilizers, as he agrees to do.

Mr. HAMMITT. As I have stated, I do not know how you can make anything very workable out of this particular stipulation involved in this Ford offer, but even if there were a stipulation that was actually workable and which involved a guaranty to engage in a fertilizer operation, it still seems to me that nobody could very well afford to turn down a proposition that involved so much to boot as involved in that Ford offer.

Senator HEFLIN. But rather than permit Mr. Ford to get it and manufacture fertilizer in competition with you, would you not give the amount that he suggests he is willing to give and let it stand idle?

Mr. HAMMITT. Well, I have never been faced with any such alternative; no; but we certainly could not afford to pay that amount and keep the plant idle.

Senator HEFLIN. Well, you suggested you would not agree to make fertilizer unless you could get hold of his secret process.

Mr. HAMMITT. Oh, no; I meant merely to indicate the fact that you have touched upon what would be the most difficult part of our problem, and if Mr. Ford has a secret process that can make fertilizer at half the present cost that would be a very excellent solution of the problem. I think it would be worth while to wrestle with that problem, if you could have as your compensation for doing so that water power delivered on the kind of terms contained in Mr. Ford's offer; but that, I think, is a pretty heavy price to pay to induce anybody to operate a plant which is not a feasible commercial operation.

The CHAIRMAN. If the Senator is through I want to ask you to go back again to the beginning of your testimony, where you made some statement about costs, as to what you had to pay in Canada for your power.

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. Assuming that Dam No. 2 is finished and Dam No. 3 is finished, by the utilization of steam power to convert secondary into primary power, and assuming that you can use all the power you produce, what, in your judgment, would be the cost per kilowatt hour down there at Muscle Shoals?

Mr. HAMMITT. Well, I am afraid I am not sufficiently equipped with a preliminary study of that question, Senator, to give you a very reliable estimate; but I think, in general, the estimates of cost of power submitted to the various committees of Congress by Col. Hugh Cooper a year ago are reasonably sound estimates for the Muscle Shoals development.

The CHAIRMAN. Do you remember what they were?

Mr. HAMMITT. Yes; he estimated that the primary power based on the development only of Dam No. 2—

The CHAIRMAN. All right.

Mr. HAMMITT. Would be worth 4.4 mills per kilowatt hour, assuming the payment of 5 per cent interest on the Government's investment.

The CHAIRMAN. And what assumption about the secondary power?

Mr. HAMMITT. And the assumption about secondary powers—and this involves the sale of a considerable amount of secondary power, the sale, as a matter of fact, of 450,000 horsepower years of secondary power at an average of 1.2 mills per kilowatt hour.

The CHAIRMAN. The sale of how much at 1.2 mills?

Mr. HAMMITT. Four hundred and fifty thousand horsepower years, on a 50 per cent load factor, which means that he would get only kilowatt hours out of it for half time.

The CHAIRMAN. What I am trying to get at is this: I want to see if there can be a condition brought about down there at Muscle Shoals that would give us power as cheap as you get it at Niagara Falls on the Canadian side. Have you given enough attention to the probability of the development of storage reservoirs, etc., so that all the power produced could be utilized and as much as possible turned into primary power, to give an answer to that question?

Mr. HAMMITT. I think I could say that it is probably impossible to deliver at Muscle Shoals primary power at as low a price as we pay for power. I think that if that development is made in a normal way there will be secondary power that will be substantially cheaper than the power that we have at Niagara Falls; I mean cheaper per kilowatt hour.

The CHAIRMAN. Yes.

Mr. HAMMITT. I should think that the secondary power down at Muscle Shoals ought to be exceedingly cheap.

The CHAIRMAN. Well, some of it would be, but it would depend on what portion of the year you were going to use it, I suppose, and its market value depends on that to a great extent.

Mr. HAMMITT. I do not think in the operation of a nitrate plant it would make any great difference what portion of the year you had the power, practically, because the only practicable way of operating that nitrate plant with secondary power would be to shut it down during the period when you did not have power.

The CHAIRMAN. Now, taking that idea, suppose we went on the theory that we would shut it down three months of the year, during the driest part of the year, and then operate it on the power that was not in existence during the driest part of the year; in other words, with secondary power; you could figure that cost at almost any figure you wanted to, because there would not be any way to say just what that power was worth, would there? I do not mean what it is worth, but what it would cost to develop it.

Mr. HAMMITT. No. Well, for one thing, it would cost the generating equipment, which you would not require if you did not have that amount of power.

The CHAIRMAN. But that would be about the only extra amount of cost that you would be put to, would it not?

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. On that basis could not that plant be operated and make nitrates as cheaply as you make them with your cheap power?

Mr. HAMMITT. Certainly not, unless you operated that Muscle Shoals plant to its capacity, and even then I would say that you could not if you had to shut—

The CHAIRMAN. Well, if you had it for nine months in the year and then shut it down for three months.

Mr. HAMMITT. I think you would be greatly handicapped by your shut-downs and the necessity of the carrying on your overhead during that period of time, and by inefficiencies that are produced by a noncontinuous operation and by—

The CHAIRMAN. You yourself proposed that the way to run this plant was to operate it by secondary power instead of primary power.

Mr. HAMMITT. Oh, no; I said that if you are going to operate it by secondary power the most practical way was to shut it down during a part of the year.

The CHAIRMAN. Yes.

Mr. HAMMITT. But I do not see any such economies on power cost as would justify an operation on secondary power.

The CHAIRMAN. I think that is all, unless there is something further you want to say.

Mr. HAMMITT. Not a thing, Senator.

STATEMENT OF MILTON WHITNEY, CHIEF, BUREAU OF SOILS, DEPARTMENT OF AGRICULTURE, WASHINGTON, D. C.

The CHAIRMAN. To begin with, so you will be identified on the record, give your name and occupation.

Doctor WHITNEY. Dr. Milton Whitney, Chief, Bureau of Soils.

The CHAIRMAN. How long have you been chief of the Bureau of Soils, Doctor?

Doctor WHITNEY. About 27 years.

The CHAIRMAN. What was your business prior to that time?

Doctor WHITNEY. Scientist, investigating soils and fertilizers.

The CHAIRMAN. Are you a chemist?

Doctor WHITNEY. Yes.

The CHAIRMAN. Were you engaged in the investigation of various chemical activities prior to your connection with the Bureau of Soils?

Doctor WHITNEY. Yes.

The CHAIRMAN. Where?

Doctor WHITNEY. Well, after my course at the Johns Hopkins University—a special course under Doctor Remsen—I was assistant chemist at the Connecticut Experiment Station in the fertilizer control. Then I was superintendent of the experiment farm at Raleigh, N. C., and then I was vice director of the experiment station in South Carolina, and then was at the Johns Hopkins University, cooperating with the Maryland Agricultural College and the Weather Bureau on soil investigation, and then came to the department about 27 years ago.

The CHAIRMAN. I think probably you had better say for the record, Doctor, whether you are interested in any way in any fertilizer operations in the commercial world?

Doctor WHITNEY. Not at all. I am not interested in any way in any fertilizer company, but only in a general way in the fertilizer investigations and in the fertilizer materials. I have no particular information with regard to Muscle Shoals. I have never been there and have only conferred with the War Department in connection with the operation of that plant when it was under their charge.

The CHAIRMAN. Which plant do you mean?

Doctor WHITNEY. The Muscle Shoals plant.

The CHAIRMAN. There are two there.

Doctor WHITNEY. I am particularly interested in the Haber.

The CHAIRMAN. In the Haber process?

Doctor WHITNEY. In the Haber process.

The CHAIRMAN. That is the one that did not pay down there?

Doctor WHITNEY. Yes; on account of the construction.

The CHAIRMAN. Now, Doctor, we are considering the Muscle Shoals proposition, and one important consideration, and one object Congress had in view at the very beginning, as shown by the statute when that place was selected, was to extract from the air nitrates with a view of making fertilizer, cheapening the product to the farmer. The first object was a war one. The peace part of it was to make fertilizer, or to make at least one of the principal ingredients of fertilizer, of which we were very short in this country.

The committee would like to hear from you on the practicability of the extraction of nitrates from the air, or anything, Doctor, that will be of interest in consideration of the general project, and we sent for you, because we consider you an expert in that line. Now, we would like to have you give us in your own way any information that you can in regard to the various methods, and the methods particularly there, which consist of the Haber process, which was not properly constructed and never was a success and also the cyanamid process, which was a success.

Doctor WHITNEY. Mr. Chairman, the general fertilizer situation in the country at present is the basis of the whole consideration—what we are using and what we need and how urgently we need it.

The present tonnage of fertilizers is approximately 8,000,000 tons a year. That varies from time to time. Last year, on account of economic conditions, the production was about half of that—a little more than half. But 8,000,000 tons is what we consider the normal supply of fertilizers, and the cost to the farmer, according to the census for 1919, was \$225,000,000.

Senator HARRISON. Was that a normal year?

Doctor WHITNEY. 1919 was about a normal year. In 1919 the estimated tonnage of fertilizers was 6,891,322 tons. In 1920 it was 7,654,239 tons. So that it was somewhat short.

Senator HARRISON. What was it just before the war?

Doctor WHITNEY. In 1913 it was 6,544,345. In 1914 it was 7,340,528.

The CHAIRMAN. Now, you are speaking, Doctor, about fertilizer, are you not?

Doctor WHITNEY. Well, I am speaking really of the fertilizer trade. There is no precise information as to how much is used by the farmers as fertilizer material.

The CHAIRMAN. I have reference particularly to this tonnage that you have been giving us. Does that mean the fertilizer ready to be put on the ground?

Doctor WHITNEY. Yes; ready to put on the ground as it goes to the farmer.

Senator HEFLIN. Did you give the amounts for 1920 and 1921?

The CHAIRMAN. Yes; he did.

Doctor WHITNEY. I have given the 1920 figure. The 1921 figures were approximately 4,500,000 on account of the business depression.

Senator HEFLIN. A falling off of about half?

Doctor WHITNEY. Yes; for that one year. They expected a tonnage of about 8,000,000 tons that year.

Senator HEFLIN. What was the tonnage for 1920?

Doctor WHITNEY. It was 7,654,239.

Senator KENDRICK. Do we produce any fertilizer that is exported, Doctor Whitney?

Doctor WHITNEY. Yes. We export phosphate rock.

Senator KENDRICK. But I mean the commercial fertilizer, ready to use?

Doctor WHITNEY. Well, acid phosphate. We produce some acid phosphate and export that.

The CHAIRMAN. Where do we get the phosphate rock?

Doctor WHITNEY. The principal mines are in Florida and Tennessee. The Florida fields supply all of the Atlantic Coast States east of the mountains. The Tennessee mines supply all west of the Allegheny Mountains.

Senator KENDRICK. We have hundreds of thousands of acres of it in Wyoming.

Doctor WHITNEY. The Wyoming field—the far western supply, of course, practically has not been touched, although they are now making what they call a double or treble super phosphate which runs about 60 per cent of soluble phosphoric acid, so as to be able to compete on freight rates with the more dilute material that they produce in the east.

The CHAIRMAN. How far from Muscle Shoals are the mines in Tennessee?

Doctor WHITNEY. Well, I have not been to Muscle Shoals.

The CHAIRMAN. Muscle Shoals is in northwestern Alabama.

Doctor WHITNEY. Yes; I understand. They are about fifty or a hundred miles.

The CHAIRMAN. Is it in such shape that it can be economically mined—the Tennessee supply?

Doctor WHITNEY. Oh, yes.

The CHAIRMAN. Now, Doctor, in considering the making of a completed fertilizer, does the freight on the phosphate rock cut quite a figure? Is that quite an item?

Doctor WHITNEY. Yes; there is freight right through every operation.

The CHAIRMAN. Then to make the most economical fertilizer it is desirable, I suppose, the supply of phosphate rock should be as near as possible to the place where it is manufactured?

Doctor WHITNEY. Yes. If I may give an illustration—of course, this was under war conditions—the ocean freight from Florida points I should say in the period 1918 and 1919 was about \$6 a ton, or very nearly \$6 a ton. It was about \$5.75 a ton from Florida points to Baltimore, Philadelphia, and Carteret, N. J.—virtually New York—while the value of the material under some of the old contracts that were still in operation was less than \$2 a ton. You see it became really a frightful condition, entirely distorted.

The CHAIRMAN. It was almost prohibitive?

Doctor WHITNEY. It was almost prohibitive.

Now, gentlemen, in the 8,000,000 tons of fertilizer that I am taking as what we may call a normal production, we use approximately 3 per cent of ammonia, 8 per cent of phosphoric acid and 3 per cent of potash. That makes, for 8,000,000 tons 240,000 tons of ammonia. That is what we estimate that we use now—240,000 tons of ammonia, which is equivalent to 197,000 tons of nitrogen, or, in round numbers, about 200,000 tons of fixed nitrogen.

We use 640,000 tons of phosphoric acid in our national fertilizer bill. We use 240,000 tons of potash. Now, if we add those figures we get about a million tons. You get this statement: Out of 8,000,000 tons of fertilizers that are used by the farmers, the essential plant food constituents constitute 1,120,000 tons, and the natural filler—I don't say that it is an artificial filler, but the constituents that go with those materials that the farmers buy, and constituting for him waste product, is 6,880,000 tons. That is the amount of material which we ship over the country that is really not necessary.

These are chemical figures.

Senator KENDRICK. Doctor, I don't like to interrupt you there, and I won't any more than I have to, but I do want to secure a little information on that point of the waste material.

Would it not represent a great saving if this product could be delivered to the farmer so that he could do the mixing at home and save the freight and expense of this waste material that is transported all over the country?

Doctor WHITNEY. Well, it could not be done at present. I will develop that a little further. The present practice is such that we have been compelled to use low-grade materials. Now, when you come to using low-grade materials it is a question whether they can be shipped and handled by the farmer as well as they can by the manufacturer, but there is a still deeper question than that possibility.

I was going to say that these figures are expressed in chemical terms. It would be safer to say that the fertilizers that our farmers buy carry somewhat less than 2,000,000 tons of material they want and somewhat more than 6,000,000 tons of material that they do not need. Now, I made a rough estimate of the saving which would be made if we had concentrated fertilizers and could eliminate the unnecessary materials. I estimated that you would save about \$16,000,000 in the distribution from the fertilizer manufacturer to the farmer. Now, I did not attempt to estimate the difference in freight of the material to the fertilizer manufacturer. You see, there is a double charge that is to go into the fertilizer.

The CHAIRMAN. They ship it in to the manufacturer and then he ships it out.

Doctor WHITNEY. Then he distributes it. Now, I had the figures for distribution, approximately—very reliable, I think—and we would save about \$16,000,000 on freight.

The CHAIRMAN. Then it would be safe to say that the saving would be a little more than that, would it not?

Doctor WHITNEY. Oh, yes. You would save on the bags. There would be a saving not only in the freight, in the collection or in the flow of the materials to the manufacturer and the distribution of fertilizer to the farmers, but there would be a saving in the bags, and there would be a saving in the handling charges. So that the actual saving would be more than the \$16,000,000 that I have given.

The CHAIRMAN. Doctor, is it not possible to teach the farmers to do their own mixing when they get the proper ingredients? Is it not possible to teach them by bulletins from the Government?

Doctor WHITNEY. Senator, I think the question is a question of the cost of the service. I have always considered and have always told the fertilizer manufacturers that it is perfectly possible for the farmers to mix their own fertilizers. They can not mix it as well. It is not as uniformly mixed. They can not take advantage of the market, as the manufacturer with capital can. Now, it is up to the manufacturers to perform this service of collecting the materials and putting the fertilizer out to the farmer for such a margin of profit, at such an expense that the farmer will say, "Well, I can get it mixed for so much; the service costs me so much, and I will not bother; I will buy the mixed fertilizers."

It is precisely in the same situation that you found yourself years ago, when you were young. Senator, when the housewife considered whether she would buy the cloth for the husband's clothes or for her own clothes or whether she would get them made by the tailor or get them ready-made, and a great many families made their own shirts, their own clothes, and their own shoes. Now, with the organization of these manufacturing interests it was found that the cost of service was so little that the difference in the cost of the material and of the finished article had such a narrow margin that the housewife said, "Why, you can go down and buy your clothes. I can't afford to make them."

Senator KENDRICK. And it resulted in a superior article at that.

Doctor WHITNEY. A more uniform, better put together, more stylish article; and that is the way that thing went. I think it is the same thing with regard to the home mixing of fertilizers.

The CHAIRMAN. But in the illustration you give, the only material that was put in in addition to the cloth was the thread and buttons and such as that, which constituted such a small part of the charge for transportation that it would be impossible to compute it. Now, in the fertilizer proposition the transportation charge is an enormous thing.

Senator HEFLIN. About three-fourths of the weight is the filler, as I understand it.

The CHAIRMAN. Yes.

Doctor WHITNEY. Well, we have not yet come to the question of our ability to make concentrated fertilizers. We are discussing now the question of whether the farmer can take this low-grade material that we are now using and mix it for himself, and there the question is of the cost of the service of the manufacturer.

Senator KENDRICK. Doctor, may I ask a question there?

Doctor WHITNEY. Yes.

Senator KENDRICK. It occurred to me to ask you as to whether or not there could be a filler, as you call it, used that would serve a useful purpose in the soil?

Doctor WHITNEY. Well, of course, it is claimed with regard to the organic ammoniates that the organic matter does have a value. Now, how far that claim can really be substantiated it is very hard to say, because experiments, the actual plot experiments that have been made, indicate about the same increase in crop production whether the nitrogen is applied in the form of nitrate of soda or ammonium sulphate, which have no organic matter with them or in the form of organic ammoniates, so that that is rather a debatable question. On the whole, I think it enters very little into the problem.

The CHAIRMAN. Now, Doctor, I would like to find out whether, as a practical proposition, this mixing could be done by the farmer. Now, I want to ask you, for instance, the ammonia that you are going to use now in making fertilizer, as I understand it, can not be used as ammonia in mixing it, can it?

Doctor WHITNEY. No. It has got to be fixed.

The CHAIRMAN. It has to be—

Doctor WHITNEY. Combined with something.

The CHAIRMAN. It has to be combined with something before you can mix it, does it not?

Doctor WHITNEY. Yes.

The CHAIRMAN. Now, what do you combine it with? Is it combined with a filler, or combined with something that is of some value itself as a fertilizer?

Doctor WHITNEY. Mr. Chairman, the substance that is produced in the Haber process, and one of the substances that would be produced from cyanamid, if cyanamid itself was not used as fertilizer, is ammonia gas. It is here in this bottle. It is an invisible gas; very pungent. If I took the stopper out of this bottle, the characteristic odor of ammonia would be very strong. It is ammonia gas. That in itself is utterly unfit for use as fertilizer in this gaseous state as it comes out of the Haber process. It can not be used in this state. Now, it has got to be mixed with something.

The CHAIRMAN. Apparently that bottle is empty.

Doctor WHITNEY. Yes; apparently it is empty.

The CHAIRMAN. Let me ask you, more as a matter of curiosity than anything else, does it weigh more than air?

Doctor WHITNEY. This is lighter than air.

The CHAIRMAN. So if you open it this bottle would weigh more than it does now?

Doctor WHITNEY. Yes, slightly more. Ordinarily that ammonia gas is absorbed in sulphuric acid, and that makes a solid white crystalline compound called ammonium sulphate.

The CHAIRMAN. That is what you have there?

Doctor WHITNEY. This is the ammonium sulphate that is made from the ammonia gas and absorbed in sulphuric acid. Now, the sulphuric acid has no particular value as a fertilizer. It is merely a carrier of this nitrogen. When ammonium sulphate is bought for fertilizer we buy only the nitrogen that it contains. This will answer your question, Senator Heffin. This then becomes a natural filler. It is worthless as a fertilizer. The sulphuric acid is worthless, but we have to use something to get this gas in a condition to apply or to mix with fertilizers.

What we mean by a concentrated fertilizer can be very nicely illustrated right here. We have been making investigations for a number of years on the recovery of phosphoric acid from our rock phosphate mines. The present method is to treat this rock with sulphuric acid. We treat one part of the rock with one part of sulphuric acid. The rock contains about 32 per cent of phosphoric acid. By treating a ton of it with a ton of sulphuric acid we dilute it to a 16 per cent phosphoric acid.

Now, that is one way in which we deliberately put a filler in that is of no particular value to the farmer. Now, instead of treating this phosphate rock with sulphuric acid to make the phosphoric acid more soluble we treat it with sand and coke. We mix the rock, sand, and coke and make a briquette, which has sufficient natural binding power to hold it together. That is smelted in a furnace, either an electric furnace or a

fuel furnace which we are now working on, and that drives off the phosphoric acid. Instead of treating the rock with sulphuric acid we treat it with silicic acid or silica from the sand. As soon as that melts it drives off the phosphoric acid, and we collect that as a liquid. Now, we have a liquid containing phosphoric acid. Here is phosphoric acid that we buy for our fertilizers in a crystalline state. This is 100 per cent pure. Instead of mixing ammonia gas, obtained from the by-product coke ovens or from the Haber process, with sulphuric acid and making ammonium sulphate, which carries a filler, we propose that we absorb this ammonia gas in this liquid phosphoric acid and make ammonium phosphate, which is also a substance that can be mixed with fertilizers.

Now, the filler that is contained in here, which is necessary for the fixation of ammonia gas, is of value because instead of being sulphuric acid, which the farmers do not want to buy, it is phosphoric acid.

The CHAIRMAN. Which they do want to buy?

Doctor WHITNEY. Which they do want to buy.

So that they want both parts of this. When they have the ammonium sulphate they only want one part.

The CHAIRMAN. After that is combined what percentage of the completed fertilizer does it constitute?

Doctor WHITNEY. Now, that gives you a combination carrying 12 per cent of nitrogen and 61.7 per cent of phosphoric acid.

Senator KENDRICK. Nearly 75 per cent.

Doctor WHITNEY. Yes; fully 75 per cent of ammonia and phosphoric acid.

The CHAIRMAN. But that is not, Senator, 75 per cent of the completed fertilizer.

Senator KENDRICK. Is it not?

The CHAIRMAN. No; I did not understand that from his answer. That is merely the percentage of this compound.

Doctor WHITNEY. Now, Senator, we have ammonia and phosphoric acid. Now, the Muscle Shoals plant is equipped to make ammonium nitrate.

The CHAIRMAN. Which plant are you speaking of now?

Doctor WHITNEY. That is the cyanamid plant. So that we have the ammonia gas passed through an oxidizing process by which we get nitric acid. We have been talking about sulphuric acid and phosphoric acid. Now, we can get the nitric acid and combine this ammonia gas with nitric acid and then we get an ammonium nitrate (a very rich material) which you have heard of in connection with this Muscle Shoals plant, and which carries 35 per cent of fixed nitrogen. This can be mixed in all proportions with this ammonium phosphate. Then the further possibility is shown of mixing with this phosphoric acid, potash salts. There are several ways in which that can be accomplished, but by mixing the potash with the phosphoric acid you get potassium phosphate, and then you have all three of the necessary fertilizer materials in the most concentrated form in which they are now produced. You have nitrogen in the form of ammonium salts; you have nitrogen in the form of nitrate salts; you have your phosphoric acid and your potash.

In these three forms they can be mixed together without any filler in the most concentrated condition that it is possible to secure.

Senator HEFLIN. Well, can not the farmer be taught to use so many parts of this and so many parts of that in making a ton of fertilizer?

Doctor WHITNEY. Ah! If you make it. But it is not possible to buy these things. That is what we are talking about. It is not possible until we get these fixed nitrogen products. You can take nitrate of soda—

Senator HEFLIN. That is what I am speaking about; but when you do get them.

Doctor WHITNEY. When you do; yes.

Senator HEFLIN. I am speaking about the situation presented at Muscle Shoals. If that plant is developed down there so that it will make these fertilizers, then will it not be possible to supply this stuff to the farmer, and have him mix it, or have a mixer in the county, where farmers can have the materials mixed, and save the freight on the filler?

Doctor WHITNEY. Anyone can mix it. Here is a concentrated complete fertilizer, that I think maybe is 2-3-2, or, as you express it in the South, 8-2-2; that is, 8 per cent of phosphoric acid, 2 per cent of ammonia, and 2 per cent of potash. That is made of ammonium nitrate, ammonium phosphate, and potassium phosphate. It contains in this form 12.29 per cent of nitrogen, 49.12 per cent of phosphoric acid, 12.29 per cent of potash, and then it has some combined water. As it stands here, to dilute that to the form in which it is sent to your cotton farmers, you would have to add 83.73 per cent of filler.

Mr. Chairman, that is the concentrated fertilizer idea.

The CHAIRMAN. Do you think it is a practical proposition there at Muscle Shoals to make that concentrated fertilizer as you have described it?

Doctor WHITNEY. There is no question.

The CHAIRMAN. Can we do it down there?

Doctor WHITNEY. There is no question.

The CHAIRMAN. With either one of the processes?

Doctor WHITNEY. With either one of the processes. There would be some additions that you would have to make.

The CHAIRMAN. Well, now, can not that be done in any fertilizer-manufacturing establishment, excepting where they take the nitrogen from the air? Why don't the men now do that—the fertilizer people?

Doctor WHITNEY. Well, it is not feasible. They can not get the ammonia in the quantities. It could be done, but it would change the existing plants.

The CHAIRMAN. Well, I understand from one of the witnesses we have had here, where they utilize their water-power machinery over there in Canada and then ship it to different parts of the United States and complete its manufacture in a completed fertilizer, they are getting the nitrogen from the air.

Doctor WHITNEY. Yes.

The CHAIRMAN. Why can't they—they have the cyanamid process over there just the same as we have at Muscle Shoals—why can't they and why don't they, as a matter of economy, ship their fertilizer in concentrated form?

Doctor WHITNEY. Well, I will tell you. It is a very interesting thing, and rather an involved situation. One of the fertilizer companies has been making an ammonium phosphate. There is no sale for it. The double and treble superphosphate that is made from the Wyoming phosphate mines encounters difficulty in its sale when it comes in contact with 16 per cent acid phosphate from the Tennessee mines, because in order to make up a ton of 2,000 pounds of the low-grade fertilizers that the American farmer has been accustomed to use, they have got to buy filler at the factory and deliberately reduce the strength of the high-grade material in order to comply with the present standards of the fertilizer industry.

Senator HEFLIN. Doctor, in pounds, now, what proportion of the ton of fertilizer consists of filler?

Doctor WHITNEY. In this mixture I have shown you, 1,750 pounds.

Senator HEFLIN. My understanding is that somebody has testified here that it is 1,500 pounds.

Doctor WHITNEY. It is 1,750 pounds in this 2-8-2 mixture.

Senator HEFLIN. The filler?

Doctor WHITNEY. The filler.

Senator HEFLIN. So when the farmer pays freight on a ton of fertilizer he pays freight on 1,750 pounds of sand or something else.

Doctor WHITNEY. Not all sand. This is a natural filler. We don't want to imply that the fertilizer manufacturers have deliberately put things in, because they don't. They aim to avoid that. But what they do is to get very low-grade material and put that in.

Senator HEFLIN. Which is worth nothing as a fertilizer?

Doctor WHITNEY. Which is worth nothing as a fertilizer.

The CHAIRMAN. What is the filler composed of?

Doctor WHITNEY. Well, in the case of muriate of potash, 50 per cent of that is potash. That is what the farmers buy; 50 per cent is chlorine, which could be made into hydrochloric acid and sold to manufacturers who want it, but it is actually used in fertilizers, and the farmers are delivered something that they don't need and don't want.

The CHAIRMAN. What I am trying to get at is what is that something. Now, you have 1,750 pounds of filler in a ton of fertilizer?

Doctor WHITNEY. Yes, sir.

The CHAIRMAN. What does the 1,750 pounds consist of? You say it is not sand?

Doctor WHITNEY. No, it is not sand. In the case of cottonseed meal there is only 7 per cent of nitrogen—about 8.4 per cent ammonia. That is bought on the basis of the ammonia content. That ammonia is in the form of protein substances which are very valuable feeding constituents. The situation in the South to-day is that we can not afford to ship cottonseed meal to the Northern States, as we used to, for fertilizer purposes, because it is one of the lowest grade fertilizer materials we have, but as a feeding stuff, with 40 per cent of proteins, it is one of the most concentrated feeding stuffs that we have, and the material is going into feeding stuffs rather than into fertilizer.

Senator KENDRICK. During the fall of 1919 cottonseed cake, which is something like the same as meal, sold for from \$80 to \$100 a ton?

Doctor WHITNEY. Yes.

Senator KENDRICK. For feed for live stock?

Doctor WHITNEY. Yes. During the war the question arose in the department as to whether we should not deny the use of cottonseed meal for fertilizers. I told them no, not until they had a substitute for it, and that is the situation now. The cottonseed meal and cake is going into feeding stuffs and slaughterhouse tankage is going into feeding stuffs; dried blood is going into feeding material. It is a very valuable, very concentrated animal food, and a low-grade fertilizer material. As they are getting more careful in their preparation, so that it is fit for animal consumption, it is going more and more into that use, and this will be withdrawn to a very large extent from fertilizer use. Their use is now being contracted for fertilizers and we need something to take their place.

The CHAIRMAN. To get back to my question again, a ton of completed fertilizer contains 1,750 pounds of filler and 250 pounds of fertilizer. Why could you not use sand for that filler? What is the objection to it?

Doctor WHITNEY. Well, there is no objection if it is known what you are doing, but we do not need it if we can get a low-grade material like this. You do not need any sand, because every 100 pounds of this one contains 7 pounds of nitrogen. You do not need any sand if you select a low-grade material. You do not need to add a filler.

Senator HEFLIN. Is sand a good filler?

Doctor WHITNEY. Yes, sir; for a diluent.

SENATOR HEFLIN. Would sand be more costly than this low-grade filler that you are speaking about?

Doctor WHITNEY. Yes; I think so. I think they figure that they would rather have the rock shipped from Florida, the phosphate rock shipped from Florida with the natural filler it contains of lime, than to concentrate that at the mines and send it up in a concentrated form and then buy sand near the factory.

The CHAIRMAN. That is what I was trying to get at, Doctor. I was talking to Major Burns here.

Major BURNS. I don't believe the Senator has realized that a great part of that filler is sulphuric acid, which you can not possibly eliminate.

Doctor WHITNEY. You can not eliminate it.

Major BURNS. He would like to know what part of that is filler which can not be eliminated and what part is filler that is put in.

Doctor WHITNEY. Oh, they don't put much in. It is this natural filler that I am telling you about. The only way to get rid of that is to offer the material that the farmer wants fixed in some other form. Instead of giving him ammonium sulphate, give him ammonium phosphate.

The CHAIRMAN. You say the completed fertilizer contains 1,750 pounds of filler, a material which does not do the farmer any good.

Doctor WHITNEY. Well, I told you in the case of cottonseed meal only 7 per cent of that does he value at all in his fertilizer. The other 93 per cent is organic matter, natural organic matter. The nitrogen content is only an incidental part of the plant material. Is that clear, Senator?

The CHAIRMAN. No; I confess I don't quite understand. We have got 1,750 pounds in every ton that is no good, and you have to have something—it don't make much difference what that 1,750 pounds is composed of, so long as it would not do any harm.

Doctor WHITNEY. But you don't have to have that 1,750 pounds. It can be eliminated.

The CHAIRMAN. Then we ought to eliminate it if we can.

Doctor WHITNEY. It is eliminated in this mixture that I showed you.

The CHAIRMAN. But you are not able to get that mixture on the market now, are you?

Doctor WHITNEY. Well, no; simply because the material is not prepared on a commercial scale.

The CHAIRMAN. I can not understand, then, why they do not prepare it on a commercial scale and use it for fertilizer instead of using such a large percentage that does not do anybody any good but is expensive to handle.

Doctor WHITNEY. Senator, it is because the fertilizer industry has from the first been a scavenger industry. It has not been on a chemical basis. They have been utilizing these waste products. Now, they are using garbage tankage for fertilizer purposes. I would say rather that they are using base goods, not garbage tankage, but base goods. That is, they are taking on shavings and hair and felt hats and all sorts of material.

The CHAIRMAN. Old shoes?

Doctor WHITNEY. Old shoes that the States prohibit in their original forms because they are so inert and so useless. They are taking those now and putting them in their acid chambers, and they are acted upon and their form is entirely lost. They come out a sort of soup, and that material is permitted in fertilizers, and the nitrogen is practically just as effective as any other form of nitrogen but that material only has 2 per

cent of nitrogen in it. We call that a low-grade material. Ninety-eight per cent of the material in there is part of the original leather, part of the original hair, or part of whatever you choose that has never been separated from it.

Now, in the case of coal that you coke, there is 2 per cent of nitrogen in coal. You would not think of applying coal to your land, because the nitrogen is unavailable. What they have to do is to process that coal. They coke it and in the coking products are given off—tars and gases—and out of that gas comes this ammonia. The nitrogen is converted to ammonia, and by going through that by-product coke oven the nitrogen is segregated into ammonia gas.

Senator KENDRICK. But the coke is destroyed, is it?

Doctor WHITNEY. The coke is used for the iron industry and the tar is used for the dye industry. So that you have segregated that and also utilized what would have been a natural filler and worthless material to the farmer.

Senator HEFLIN. Now, then, Doctor, after you get these fertilizer ingredients as you have them here, and you mix them together, then a ton will be a ton of fertilizer?

Doctor WHITNEY. A ton will be a ton of fertilizer, and a ton of that material will be equivalent to about 5 tons of our ordinary fertilizer.

Senator HEFLIN. And this filler that we have been discussing will be eliminated?

Doctor WHITNEY. Will be eliminated.

Senator KENDRICK. Doctor, you have stated that the manufacture of commercial fertilizer has proceeded on a scavenger basis.

Doctor WHITNEY. Yes, sir.

Senator KENDRICK. Is it not true that that has been based on the impression that this filler, so-called worthless material, has had a value?

Doctor WHITNEY. Well, there is really no claim to that.

Senator KENDRICK. I thought the commercial fertilizer manufacturers did claim great value for this material that they use out of stockyards and—

Doctor WHITNEY. Yes; they make a claim, but it is not bought on that basis.

Senator KENDRICK. I thought it was sold on that basis.

Doctor WHITNEY. No; it is not sold on that basis. The market price of the organic ammoniates up to the period of the war was set by the price of nitrate of soda in the markets of the world. Now, there was a fluctuation. They would go up or they would go down with respect to each other, according to market conditions. But the price of nitrogen in nitrate of soda was a controlling influence on the price of organic ammonia, and it was not until the value of these wastes products for feeding stock was recognized during the middle part of the war, when they parted from each other.

Now they talk a great deal about the value of the organic matter, and in a way I think they are right. They do not practice it. When you buy your fertilizer you buy it on the—

Senator KENDRICK. Well, does that mean that fertilizer has been analyzed and is consumed as it is sold according to the values of these nitrates and other products?

Doctor WHITNEY. No; as carrying certain proportions. The fertilizer is marked with the amount of nitrogen it contains, and very seldom does it carry the information as to the source of that nitrogen, so the farmer does not know whether he is buying one form or another. It is sold to him as so much nitrogen, on the basis of so much nitrogen, so much phosphoric acid, and so much potash.

Mr. Chairman, I speak of the fertilizer industry mainly as a scavenger industry. The first things that were handled were bones on the farms, bones of animals, that were treated with sulphuric acid to make them readily available, in Scotland about 1780, I should say. Before that phosphorus was a curiosity. It was hardly known. Potash-potassium had not been discovered in 1800. You see our knowledge of chemistry, and our progress, is really very recent. Now, the commercial fertilizers, the discovery of the rock in the mines of South Carolina and Florida, was made in about 1869, and their treatment with sulphuric acid started a great development of the sulphuric-acid industry, and we have an immense development of the sulphuric-acid industry for the treating of rock phosphate. Two million tons of sulphuric acid are made annually in order to treat 2,000,000 tons of phosphate rock. Now the companies are tied up with this equipment. They have their investments in this equipment. It is only because of this new development of the fixation of atmospheric nitrogen in the form of ammonia that has enabled us to use the products of fixed nitrogen factories in our ordinary commercial fertilizers that is making it possible now to make a fresh start and put the fertilizer industry on a strictly chemical basis.

So far as we know, Mr. Chairman, the only source of our fixed nitrogen has been the sun and the growth of plants. It is the plant itself that fixes, through the influence of the sun, this nitrogen as a part of its component body. The nitrogen that we get from the cottonseed meal is a plant process. The nitrogen that we get out of fish scrap is an animal process. The nitrogen that we get out of coal in our coking process comes from the plant that grew ages ago.

So far as we know, the nitrogen of the sodium nitrate was originally fixed by plants; so that the only source of fixed nitrogen that we have had in the past has been through the action or agency of plants or of animals.

Now, 20 years ago, Sir William Crookes notified the world, in an address before the British Association that unless some means could be found of fixing nitrogen, the wheat crop of the world would not be sufficient to support the increasing population. Even since then, the scientists of the world have been working on the possibility of fixing the nitrogen of the air. The war has given the greatest possible stimulus to these matters.

We ourselves, in the Bureau of Soils, had the Haber process equipped when the War Department was seeking for nitrogen, for supplies of fixed nitrogen. That was one of the most promising methods. There are several methods, but the Haber process appealed to us as the most promising of all the methods. The cyanamide method is somewhat cheaper and is already in effect. These methods have been developed by mankind.

Now, the methods of fixing this atmospheric nitrogen make it necessary for us to add something to the product that will make it available for agriculture, and it is a question of whether you will use sulphuric acid or phosphoric acid before you will make the ammonium nitrate, or whether you will make potassium phosphate, all of which are possible with these fixed nitrogen plants, or whether you will go on with the scavenger industry that the fertilizer is to-day.

Senator KENDRICK. Doctor, is it your opinion that anything like perfection has been reached in the processes?

Doctor WHITNEY. No; I would not say that. There is no question about perfection. It is something that the world has got to work out. It is going to be improved right along. It is not perfect; none of the methods are perfect now, and none of the products are wholly satisfactory. We want to improve them; we want to improve the methods, but the possibility of utilizing these methods on a commercial scale has come through. That is well worked out.

Senator KENDRICK. That ought to guarantee increased efficiency in the future.

Doctor WHITNEY. It ought to start the fertilizer industry as a real chemical industry. We can make the cyanamide. That is one of the products, but cyanamide is not well adapted to our present practice of mixed fertilizers. You can also put a little, 50 or 60 pounds, of cyanamide in your mixed fertilizer. It is impracticable for the manufacturer to use it in larger quantities. The ammonium sulphate can be used. That is something which we are familiar with.

Senator KENDRICK. Has there been a great improvement in the processes since the war?

Doctor WHITNEY. Oh, yes; a very, very pronounced improvement. The foreign governments are quite well ahead in these matters, but they will be improved, just as everything else.

The CHAIRMAN. What foreign government does the most of it, Doctor?

Doctor WHITNEY. So far as I am informed, the German Government. They got ahead during the war with their practice.

The CHAIRMAN. They, during the war, supplied themselves with nitrates from the cyanamid and Haber processes, did they not?

Doctor WHITNEY. Very largely; yes, sir.

The CHAIRMAN. And are they operating now for fertilizer?

Doctor WHITNEY. Yes, sir; they are operating them now for fertilizer.

The CHAIRMAN. Have they anything in either one of those processes that we are not familiar with? Are there any secrets that we do not know about?

Doctor WHITNEY. Yes; the whole thing has been done by all the governments in a secretive way, and there are secrets in regard to details, though not in regard to the essential things.

The CHAIRMAN. Well, are those secrets such that they cheapen the product?

Doctor WHITNEY. Yes.

The CHAIRMAN. Then, we can not make this product as cheaply as Germany, is that the truth?

Doctor WHITNEY. No; I would not say that. Of course, you have a difference in your labor costs, and in your living and things of that kind, but we can make it here, I should say—

The CHAIRMAN. Germany seemed to be utilizing the cyanamid process there, and was using coal as fuel for power, which our scientific men believe is not a practicable proposition in this country.

Doctor WHITNEY. Yes.

The CHAIRMAN. That the power expense alone would make it prohibitive as a fertilizer. Why is it that Germany can do it and we can not do it? Does it all come in in the cost of labor? Is that the only difference?

Doctor WHITNEY. I think so. Germany has to do those things. She has limited supplies. She has to make the product. Then, there is another thing, Mr. Chairman, in connection with the German competition in chemical industries that, I think, perhaps we have not fully realized. The German workmen is trained in chemical schools. He is trained in chemical works. A large part of the industries of Germany are along chemical lines. The workmen are trained to such methods of manipulation. When we build a factory in this country, we get workmen there. Well, they are of all kinds. They may have been on the railroads, or they may have been in the mines, or they may have been in the cotton factories; but when the German build a factory they have a supply of labor—no better trained than ours, perhaps, but who have had a special training in chemical manipulation; so that the laborer that we get does not know anything about what he is doing, but the laborer that the German manufacturer gets has a certain technique that fits him at once for that particular place, although it may be an entirely different chemical industry from what he has been theretofore engaged in.

The CHAIRMAN. Have the German educational chemical institutions been superior to ours?

Doctor WHITNEY. Yes; they have been much more concentrated.

The CHAIRMAN. Take the Haber process and compare that with the cyanamide process in Germany. Which do they utilize the more there?

Doctor WHITNEY. Well, it is a little difficult for me to say, Mr. Chairman, but I think that I might say this, that the judgment of the world is that the Haber process is the better one.

The CHAIRMAN. The more economical?

Doctor WHITNEY. The more economical, provided you can get your materials.

Senator KENDRICK. Is the product substantially the same?

Doctor WHITNEY. In a way, yes. In Europe it is a common practice to apply fertilizer materials. They do not have the mixed fertilizers that we have. Their principal fertilizer manufacturer is the acid phosphate manufacturer, who manipulates the rock into the soluble form of acid phosphate. The other constituents are not mixed together. They apply their nitrate of soda or their cyanamide or their potash salts at different times when, in their judgment, they ought to be applied. Now, they have used cyanamide rather successfully. There is one school of scientists in Europe which is very strongly in favor of the use of cyanamide, but they use it by itself. There is another school that is very largely opposed to it. Now, I think there is no doubt that there are soils on which cyanamide does not do well. There are other soils on which it does. It is an uncertain proposition. It is a complicated thing that may break down in one way, which will be beneficial to plants, and it may break down in another way which will be just the opposite.

The CHAIRMAN. Then, after all, we would be confronted with the question in this country as to whether cyanamide would be a success on our soil, or we may have some soils where it would be a success and some where it would not.

Doctor WHITNEY. I think, Mr. Chairman, cyanamide will not be taken as satisfactory by the American farmers. I do not think they would touch it. The fertilizer manufacturers can not use it with their present form of acid phosphate.

The CHAIRMAN. Does that mean that, in your judgment, the operation of this cyanamide plant down there as a fertilizer proposition would be a failure?

Doctor WHITNEY. Oh, no; not at all. What is fixed down there is nitrogen. You are talking about how much ammonium sulphate you can make and how much ammonium nitrate you can make and how much cyanamide you can make. What you really do is to fix nitrogen. That plant is designed to fix 40,000 tons of nitrogen per annum. Is not that so, Major Burns?

Major BURNS. Yes, sir; 40,000 tons per annum.

Doctor WHITNEY. That fixed nitrogen has to be manipulated in some way in order to make it useful and acceptable to the farmers of this country as a fertilizer. One thing is to use the cyanamide as it is produced and finished down there. In my judgment it will not be used by the fertilizer manufacturers and I do not think the farmers would be satisfied to use it under the conditions under which they would have to use it.

Now, the next thing is to see how to get the fixed nitrogen out into a form in which it will be most valuable to the farmer. The cyanamide process appears to be the cheapest process for the fixation of atmospheric nitrogen. That is the preliminary thing to be done.

Now, that nitrogen can be turned from the form of cyanamid into the form of ammonia; so that at that point you parallel the Haber process, if you get your ammonia from your cyanamid, and you get your ammonia from your Haber process, from there on everything is along parallel lines. The only thing is that the ammonia is fixed as ammonia by the Haber process; that is, the hydrogen and nitrogen are

directly combined; but with the cyanamid process you go through this intermediate stage, in which form carbide and then cyanamid, and finally ammonia.

Senator KENDRICK. If I am not mistaken, you have shown us, Doctor, a form of compound there that includes all of the necessary chemicals used in fertilizer, have you not?

Doctor WHITNEY. Yes, sir.

Senator KENDRICK. All in one compound.

Doctor WHITNEY. Yes, sir.

Senator KENDRICK. In one compound?

Doctor WHITNEY. Well, in one mixture.

Senator KENDRICK. Yes.

Doctor WHITNEY. Yes.

Senator KENDRICK. I am not certain as to whether it was your opinion, or whether or not you made the statement that we might come to the time when we would produce that commercial fertilizer in that form without the filler.

Doctor WHITNEY. Yes.

Senator KENDRICK. Is that true?

Doctor WHITNEY. Yes, sir.

Senator KENDRICK. And that would eliminate the waste in freight rate and unnecessary difficulties of handling, and all of that?

Doctor WHITNEY. Yes, sir.

Senator KENDRICK. And would mean a greatly increased economy in the use of this fertilizer?

Doctor WHITNEY. Yes, sir.

Senator KENDRICK. That sort of preparation, however, has not yet been developed; at least they have not reached the point where they can prepare that commercially?

Doctor WHITNEY. Yes; that is true. Well, they can do it and they are doing it. Now, there is a factory operating in the South that is producing phosphoric acid, the liquid phosphoric acid, and is making the double acid phosphate. It is prepared to make the ammonium phosphate and the potassium phosphate, but is not prepared to make the ammonium nitrate that would have to go in to fortify the nitrogen content. Now, there are partial developments, you see, but the complete development has not been perfected.

Senator KENDRICK. Assuming that they could prepare this in form for actual use, what amount of weight would be eliminated from the ton—1,750 pounds?

Doctor WHITNEY. Yes. Well, in the case of this particular formula that I showed you 83 per cent—practically 84 per cent of the weight of ordinary fertilizer would be eliminated.

Senator KENDRICK. Yes. That would mean that this fertilizer prepared in this form would have about five times the efficiency—

Doctor WHITNEY. Yes, sir.

Senator KENDRICK. In rejuvenating the soil that the present form of fertilizer has?

Doctor WHITNEY. Yes.

Senator KENDRICK. Is that about it?

Doctor WHITNEY. Yes; that is the idea.

Now, the question has arisen as to how farmers are going to apply a small amount of concentrated material. They can do that in one of several ways. They can apply it directly, just as they apply straight nitrate of soda and acid phosphate at the present time. The farmers are used to distributing materials in small amounts per acre. Look at the way they distribute so uniformly a few pounds of clover seed.

Senator KENDRICK. Yes; and the finest form of seed, the smallest seed.

Doctor WHITNEY. Yes, sir; the smaller seeds. They apply a few pounds to the acre. They can apply a uniform dressing of a concentrated fertilizer, but—

Senator KENDRICK. Is it not true that we now have machinery that could be used in such application?

Doctor WHITNEY. Yes, sir; we have machinery that is not any too satisfactory. The fertilizer spreaders are not very satisfactory, even for the present diluted forms that we use. There is no doubt but what they could be improved, and if the necessity arises, I think there is no question but what the farm machinery men would put out a manure spreader that would spread uniformly even small amounts of material. If the farmer does not want to use his concentrated fertilizer then he himself or the local dealer can mix it with sand, and in the case of the truck farmers, and the tobacco farmers where they use very large applications, the material can be applied in solution and sprayed just as they spray their orchards, although they would spray their soil.

The CHAIRMAN. Doctor, how does the fertilizer, composed, as you say, of 2-8-2, compare with the ordinary farmyard manure that is spread on the soil?

Doctor WHITNEY. Well, the farmyard manure is unique. It has always been considered the most beneficial thing that can be applied, but, unfortunately, there has never been an adequate supply, and right now there is a diminishing supply.

The CHAIRMAN. Well, the farmer could control that to some extent, could he not?

Doctor WHITNEY. Yes; but you can not keep your animals just for the sake of the manure. It is a waste of product.

The CHAIRMAN. No.

Doctor WHITNEY. As in the case of the amount of cottonseed meal.

The CHAIRMAN. Would not the ordinary farmer be better off, though, if, instead of devoting all of his energies to raising wheat and corn, he would keep some stock?

Doctor WHITNEY. That is undoubtedly true, but the amount that would be required per acre of cultivated land that they had would be greater than—

The CHAIRMAN. If they raised wheat and utilized the straw, then they themselves would be able, to some extent at least, to control the amount of manure that they would be able to apply to their land.

Doctor WHITNEY. Well, it is certainly a thing to be greatly desired; yes.

Senator KENDRICK. In connection with the chairman's question, Doctor, about the relative value of the fertilizers that can be had on the farm, and are derived from the live stock, is it not true that one of the advantages of that form of fertilizer is that it does not leach out in the soil, that it tends to build the soil up more than the chemical forms?

Doctor WHITNEY. Yes, sir; there is an advantage of that kind.

Senator KENDRICK. It seems to me, as I recall from some of our earlier hearings, the statement was made by some one of the committee that these chemicals applied to the soil, however much in quantity, are only of a temporary benefit because they leach out of the soil. Is that true?

Doctor WHITNEY. Well, Senator, the most reliable information of that kind has been gained by the Rothamsted experimental station in England over the past 70 years. As I recall this offhand, where stable manure has been used continuously, the yield of crops of wheat has increased up to 30 bushels per acre. It took about 10 years to obtain that increase; that is, it was each year a few bushels, until at the end of 10 years the yield was 30 bushels. Now, they continued that for 10 years, and that yield was maintained with annual applications. At the end of these 10 years they divided their field, and stopped the use of all manure on part, but on the rest of the field they continued it. For 70 years now manure has maintained that yield of wheat.

Senator KENDRICK. Seven years?

Doctor WHITNEY. Seventy years. It took 10 years to—

Senator KENDRICK. Did you say 70 years?

Doctor WHITNEY. Seventy years; yes.

Senator KENDRICK. That is remarkable.

Doctor WHITNEY. But they had to use it every year. Now, in this half of the field that they stopped the use of it on, the yield immediately began to fall, and in 10 years it had come back to the original yield; that is, it took as long to increase the yield as it did to decrease it after the application stopped; but with a continual use, they maintained it.

The CHAIRMAN. Now, can you compare that with commercial fertilizer?

Doctor WHITNEY. In the case of the commercial fertilizer, they have also been able to obtain a yield of around 30 bushels. I have not the exact figures here, but approximately the same. It took about eight years to get that yield up with commercial fertilizers. Then, it was maintained—

Senator HARRELD. Did they start out on the same basis?

Doctor WHITNEY. They started in the same year. Yes; these were started 70 years ago.

Senator HARRELD. I mean as to the production in the beginning?

Doctor WHITNEY. The same field.

Senator HARRELD. The same field?

Doctor WHITNEY. The same field; yes.

Now, at the end of 10 years the increase was maintained, but the plots without any fertilizers, which they had used as their control plots, went down; so that what happened was that this yield went up for 10 years, and then it began to go down, but always maintaining the same increase over the unfertilized plots.

Senator KENDRICK. That is not quite clear to me, somehow.

Doctor WHITNEY. That is a little difficult to understand.

Senator KENDRICK. And I want to understand it, too.

Doctor WHITNEY. Yes.

Senator KENDRICK. You say that the yield was increased over a period of 10 years?

Doctor WHITNEY. Yes.

Senator KENDRICK. With the prepared fertilizer?

Doctor WHITNEY. Yes; that was the increase over the unmanured plot.

Senator KENDRICK. Yes.

Doctor WHITNEY. Yes; it was.

Senator KENDRICK. Then what happened?

Doctor WHITNEY. Then the increase was maintained with respect to the check plot, do you see?

Senator KENDRICK. Yes.

Doctor WHITNEY. But as the check plots were falling, were losing in productivity, the actual yield under the fertilizer became less and less.

Senator KENDRICK. That is, the fertilizer became less effective each year.

Doctor WHITNEY. It was just as effective as regards the difference between the unfertilized plots, but, as the check plots that they were comparing it with were falling, the yield under the fertilizers also fell.

Senator KENDRICK. Yes.

Doctor WHITNEY. And the fall began at this period of about 10 years after they began to apply it.

The CHAIRMAN. I think it is plain about the manure fertilizer that you applied there, but just what happened to the commercial fertilizer? They commenced to apply it every year, and at the end of eight years it got up to 30 bushels per acre?

Doctor WHITNEY. Approximately 30 bushels per acre; yes.

The CHAIRMAN. Now, at that time they divided it the same as they did in the other experiments?

Doctor WHITNEY. No.

The CHAIRMAN. And a part of it they continued to apply it to?

Doctor WHITNEY. No; not the commercial.

The CHAIRMAN. Not the commercial?

Doctor WHITNEY. No.

The CHAIRMAN. It is to be regretted that they did not perform the same experiments that they did with the other.

Doctor WHITNEY. Yes.

The CHAIRMAN. They continued to apply it, then, on the commercial?

Doctor WHITNEY. Yes.

The CHAIRMAN. And notwithstanding its application, at the end of 10 years it commenced to go down?

Doctor WHITNEY. At the end of 10 years it commenced to go down.

The CHAIRMAN. How many years did it take it until it got back to where they started?

Doctor WHITNEY. Well, the fall in the yield of the fertilized plots was proportional to the fall in the yield of the check plots.

The CHAIRMAN. That is, those that were not fertilized?

Doctor WHITNEY. Those that were not fertilized; yes, sir.

The CHAIRMAN. Still the fertilized was higher than the unfertilized?

Doctor WHITNEY. Yes.

The CHAIRMAN. Both going down?

Doctor WHITNEY. Both going down. That is it exactly.

The CHAIRMAN. Yes. Now, what I want to know, is how long did it take the fertilizers on the way down to get back to where they started?

Doctor WHITNEY. They have not gotten back yet.

The CHAIRMAN. They have not gotten back yet?

Doctor WHITNEY. The fall of the checked plots was from, I think it was, originally 16 bushels, to 9 bushels. I think those are the figures. The fertilized plots had been parallel to those, except for this initial rise of the preliminary 8-year period. Since then it has been parallel.

Senator NORBECK. What is the conclusion, Doctor—that you can not maintain soil fertility with commercial fertilizers; is that it?

Doctor WHITNEY. No; I think it is a little different from that. The lesson that I draw from that is—

Senator KENDRICK. Is it the answer that it requires more and more of it?

Doctor WHITNEY. No; I think the answer is that you can not lay down a program for a farmer that is to be followed without any variation for 70 years any more than you can lay down a program for a horse or for a cow that is to be followed without variation during its lifetime.

The CHAIRMAN. Now, let us see about that. All of this time they have been raising wheat?

Doctor WHITNEY. Yes.

The CHAIRMAN. Nothing but wheat?

Doctor WHITNEY. Nothing but wheat.

The CHAIRMAN. Does it not demonstrate that with the commercial fertilizer you can not always keep on raising one crop, but you have to put it into something else?

Doctor WHITNEY. Yes, Mr. Chairman. I have asked the gentlemen in charge of these experiments the reason for that. I said, "What has been your experience; during these years how has the soil behaved?" They said, "They have filled up with weeds; under some of these experiments they have become hard and difficult to handle; some of them have run together; some of them have become acid." I said, "Well, that is exactly the pitfall the English farmer has avoided. He has been raising wheat; 300 years ago he got only 12 bushels per acre; he is now getting 30 bushels per acre, and he has seen the necessity, during a period of 70 years, of changing his farm operations. If he feels it is becoming weedy, he changes his crop; he changes his cultivation if he feels it is becoming hard; and so they have avoided these pitfalls that these long-time fertilizer experiments have led us into."

Senator HARRELD. Doctor, would not the nature of the chemical fertilizer used cause a variance in the effects on the soil?

Doctor WHITNEY. Yes; undoubtedly, and by changing the nature of the mixture you can do much to—

Senator HARRELD. All that has been the result of experiments of scientists to get good results.

Doctor WHITNEY. Then, again, you must not forget that it is the kind of crop you are growing and it is the order of rotation. This work was done with a single crop—wheat—grown continuously for 70 years. They have another field there which they have rotated for 50 years in wheat, turnips—a four-year rotation; I do not recall the crop now—without any application of fertilizer at all, they have maintained a yield of 26 bushels.

The CHAIRMAN. Of wheat?

Doctor WHITNEY. Of wheat.

The CHAIRMAN. They put in a crop of wheat every four years?

Doctor WHITNEY. They put in a crop of wheat every fourth year, and the average of those crops is within two or four bushels of the average of the fertilized crops in those same years.

The CHAIRMAN. Where they continued to raise the same thing every year?

Doctor WHITNEY. Where they continued to raise the same thing.

Senator KENDRICK. You spoke a moment ago about fixing nitrates with different forms of plants cultivated. Is it not true that alfalfa is the greatest plant—

Doctor WHITNEY. Yes.

Senator KENDRICK. For such a rejuvenation of the soil?

Doctor WHITNEY. Yes; that is one of the best of the leguminous plants.

Senator KENDRICK. I once heard a man ask a question as to how long the alfalfa roots were. The answer was that he did not know, but the longest one he had ever seen was singed off at the lower end. [Laughter.]

The CHAIRMAN. Well, that demonstrates where he was. [Laughter.]

Senator HEFLIN. So it is necessary, Doctor, to have crop rotation; it does not make any difference what kind of a fertilizer you use?

Doctor WHITNEY. Oh, yes. Fertilizer is one method. You can not avoid these others. You have to use good cultivation; you have to use rotation of crops; you have to do good work all along the line. Fertilizer is not going to do it for you unless you follow it up and help it out.

Now, the best results they have obtained in those English experiments are where they have used rotation of crops and fertilized it.

Senator KENDRICK. Now, coming to the point with reference to Muscle Shoals, is it your opinion that it would be possible and practicable to manufacture chemicals there that are employed in the production of fertilizers? Is it your opinion that that will prove a practical success, is it?

Doctor WHITNEY. Yes, sir.

Senator KENDRICK. Have you given any thought as to what kind of power it would be necessary for us to use in such processes, whether it would be primary power or secondary power?

Doctor WHITNEY. No; I would not say as to that.

Senator KENDRICK. Have you estimated as to whether it would be possible to make such a production profitably with primary power?

Doctor WHITNEY. Well, I would not like to go into that, Senator. That would be an engineering proposition.

Senator KENDRICK. Yes.

Doctor WHITNEY. I can say that our investigations at the bureau—and we have investigated along all of these lines, on the scale that we have been able to work

with—are such that we believe that these materials can be made with a profit on the basis of the present cost of fertilizer materials.

Senator KENDRICK. Well, under an increased improvement in method, particularly toward the elimination of waste material?

Doctor WHITNEY. Yes. Mr. Chairman, I would say that it is a question not for this committee to determine. It is a question that nature itself is going to force upon us, that we have not an adequate supply of nitrogen, of fixed nitrogen.

The CHAIRMAN. Right on that point, Doctor, I would like to ask you a question or two.

Every fertilizer has to have three chemicals, as I understand it?

Doctor WHITNEY. Yes.

The CHAIRMAN. One is nitrogen?

Doctor WHITNEY. Yes.

The CHAIRMAN. One is potash?

Doctor WHITNEY. Yes.

The CHAIRMAN. And the other is phosphoric acid?

Doctor WHITNEY. Phosphoric acid.

The CHAIRMAN. Now, the plants down there are equipped to make only one of those ingredients, and that is the one in which we are particularly short in the world, as I understand it.

Doctor WHITNEY. Yes.

The CHAIRMAN. That is nitrogen.

Doctor WHITNEY. That is what we have to have.

The CHAIRMAN. To get the nitrogen, we get ammonia.

Doctor WHITNEY. Yes.

The CHAIRMAN. I wish you would tell us, if you can, what is the cost to the farmer of the ammonia that is in his fertilizer? Confine it to that one ingredient that we are going to get out of the air. Take, for instance, what I understand is the ordinary necessity, or at least the ordinary production, about eight million tons of fertilizer in a year.

Doctor WHITNEY. Yes.

The CHAIRMAN. How much of that 8,000,000 tons, or what does it cost in that 8,000,000 tons to supply the ammonia or the nitrate?

Doctor WHITNEY. Mr. Chairman, I could give you those figures. I have the proportion of nitrogen that comes from different sources. I have the wholesale prices of those materials. I have the total amount of nitrogen or ammonia that is used, so that I could figure it out for you if you wish it.

The CHAIRMAN. I wish you would figure it out.

Doctor WHITNEY. Yes.

The CHAIRMAN. Can you do that for us?

Doctor WHITNEY. Yes.

At your request I would state that at present prices for fertilizer materials, the cost to the farmer of 240,000 tons of ammonia, which is the estimated amount used in our annual consumption of 8,000,000 tons of fertilizers, would be approximately \$164,094,000, this figure including the wholesale cost, manufacturing costs, and selling and distribution costs.

The CHAIRMAN. Now, I want to ask you another question: Have the farmers been getting enough fertilizer; is 8,000,000 tons enough to supply them, or ought they to have more?

Doctor WHITNEY. They ought to have more.

The CHAIRMAN. How much more?

Doctor WHITNEY. Well, I have estimated that if the commercial wheat and corn crops were fertilized as they should be, we should probably use at least 16,000,000 tons.

The CHAIRMAN. Then, we ought to double it?

Doctor WHITNEY. We ought to double it.

The CHAIRMAN. Do you suppose that if the price were reduced, the farmers would double it? Could it be demonstrated, for instance, by your department, that it would be financially profitable for the farmers to double it?

Doctor WHITNEY. Yes; it would be if we had the material.

The CHAIRMAN. I understand that.

Doctor WHITNEY. Yes; but one of the reasons why the department has not exploited or pushed the use of fertilizers west of the present line of intensive use is because you really have not got the material. I told one of the fertilizer manufacturers some time ago that if we had the material, if we had the fixed nitrogen—we have plenty of phosphoric acid, and we can get plenty of potash, but are lacking in fixed nitrogen—if we had sufficient of it to justify a campaign of education the farmers of the United States could profitably use twice as much as we now have.

The CHAIRMAN. Now, Doctor, there is not—

Doctor WHITNEY. We are limited only by the nitrogen supply.

The CHAIRMAN. Could the people who are making the fertilizer, with their present machinery and present capacity, double their output?

Doctor WHITNEY. No, sir; they have a capacity now of about 10,000,000 tons.

The CHAIRMAN. And they have made about 8,000,000 tons?

Doctor WHITNEY. About 8,000,000 tons.

The CHAIRMAN. If we operated plant No. 2 down there—and that means the cyanamid one, to its capacity, would there be a surplus then of fertilizer in the country? Would there be more than the farmers would be able to use, provided the commercial people did the same as they are doing now?

Doctor WHITNEY. I think it would be absorbed.

The CHAIRMAN. You think it would all be absorbed?

Doctor WHITNEY. It would all be absorbed.

The CHAIRMAN. There is not any danger, then, of an oversupply?

Doctor WHITNEY. In my judgment there is not. My judgment is that if the normal increase to about $7\frac{1}{2}$ per cent a year had not been interrupted by the war we would now be using from 10,000,000 to 12,000,000 tons.

The CHAIRMAN. There is no doubt, is there, Doctor—and if there is I wish you would tell me frankly—I may be wrong, of course, but I formed the opinion not only from these hearings, but from general reading, that the price of fertilizer is so high that for the ordinary crops it is a very serious question whether the farmer can afford to pay the price he has to pay.

Doctor WHITNEY. Yes; it has been high, but there are reasons for it. There was an embargo on potash. That cut off the great source of German potash during the war, and it took us several years, as you know, to get back. We had none at all to start with. Then the feeding-stock situation increased greatly the cost of the raw materials. While I had charge of the fertilizer law, the Lever law, we had a conference to see if we could force down the price of the organic ammoniates, and we had hearings. We thought they were unreasonably high. We knew the manufacturers were paying as high as \$6 a unit, a very high price. The manufacturers said, "Well, what are you going to do? If you want us to bring the price of the organic ammoniates down somewhere near the price of the nitrate of soda or the ammonium sulphate, the feeders will take it all; you will upset the feeding market; you will lower the price of corn, and the price of everything that the farmer raises. What are you going to do: what are you going to give them—cheap fertilizers, or are you going to give them higher prices for their products?" The slaughterhouse men said, "Yes; you can lower prices. Tankage is selling now for \$80 a ton. You can put it down to any figure you want to, because we have to figure our profits on the animal, on the meat that we sell."

Senator KENDRICK. That is about what they pay for the meat.

Doctor WHITNEY. Yes. Now, they said, "If you force us to lower the price of this waste product, we will lower the price we pay for the animal or increase the price that we shall charge for the meat." So we were put to it. That was the reason that fertilizers reached such high prices.

Senator HEFLIN. But is it not a fact, Doctor, that if fertilizers were cheaper more farmers would use them?

Doctor WHITNEY. Oh, yes, Senator.

The CHAIRMAN. Well, it has been said here by one of the witnesses that if we had a sufficient supply now and if we operated this plant down there to its capacity, we would make so much fertilizer that it would put all the fertilizer people—and they have money invested in their plants—out of business, and it would throw out of business the Cyanamid Co. over in Canada. Do you know anything about that?

Doctor WHITNEY. Well, Mr. Chairman, when you come to speak of the supply, it has varied greatly with conditions. In 1920 they were preparing for a clean-up, for a banner sale of commercial fertilizers. They got together an enormous amount of material in this country. They got a great quantity of nitrate of soda, and that was thrown on the market. Europe was swamped, the markets of Europe were filled up. Chile had an enormous amount that they had stored up to sell, and the markets of the world were congested. That was a case of real congestion, but it was something that could have been regulated if the conditions had been normal.

Now, the ammonium sulphate market has fluctuated from time to time, partially, possibly, on account of foreign sales. We have sold in one year 225,000 tons of ammonium sulphate, mainly to Japan. In one year we sold Japan large quantities, and they threw it back on the market. That caused a glut, a congestion, and so it varies. This year there have been heavy exports of ammonium sulphate produced in this country, which is a very unusual thing. So there are liable to be little gluts from time to time.

The CHAIRMAN. I would like to get your opinion, if you care to give it, Doctor, and if you have sufficient information upon which you think you can give it, as to whether the operation of this plant down there to its capacity would result in the bankruptcy of the fertilizer people, and would it result in putting the Cyanamid Co. over in Canada out of business, and would it result in making so much fertilizer that the market would not absorb it?

Senator KENDRICK. And, Mr. Chairman, I think you ought to include another point there, that the same witness was apprehensive about, and that was the disastrous effect which it would have on the by-products of the United States Steel Corporation.

The CHAIRMAN. The coke ovens?

Senator KENDRICK. That they produced from their coke ovens.

The CHAIRMAN. Yes.

Senator KENDRICK. That it was going to upset that entire industry.

The CHAIRMAN. I confess that I have not been alarmed by those things, because, in my lifetime I have seen two processes developed in various ways. I have seen them go onto the market and displace others, and the people directly interested were very much frightened. Instead of being a detriment it was found that they resulted in a help to those people. I was in Congress when the printing machines were installed in the Government Printing Office and there was a terrible time here in Washington. You will remember it, Doctor.

Doctor WHITNEY. Yes.

The CHAIRMAN. Organized labor was scared to death, and I have no doubt honestly so. Men who had been working setting type all their lives thought that they were all going to the poorhouse.

Doctor WHITNEY. Yes.

The CHAIRMAN. But they did not do it. They are better off now than they ever were before.

Doctor WHITNEY. Yes.

The CHAIRMAN. I worked on the farm at \$2 a day in the harvest field, and that was the only time in the year when we got \$2 a day. It was really the only harvest we had, and we could work 15 or 20 days and get \$2 a day for it. We looked forward to that during the whole of the year. When I was a boy we were hired out to some farmer, and usually to the farmer who had the biggest crop of wheat. Along came the self-binder. I remember the first one of those that came into our country, and a lot of fellows got together one night and burned it. I will never forget when I went home on Saturday night and my good mother said, "Did you hear about the burning of that binder?" "Yes," I said, "I heard about it. It is an awful thing, is it not?" And she said, "Yes, that is an awful thing, to burn up a man's binder like that." And she thought a while and then she said, "But, after all, what are the poor folks going to do?" She was a good woman, and yet she was almost willing to forgive crime in that case, when she thought it was going to put a lot of those men out of business; but after the self-binder came along they were all better off than they were before.

Doctor WHITNEY. Surely.

The CHAIRMAN. And I suppose if this puts anybody out of business, he will find his proper place in the world and finally things will get straightened out.

Doctor WHITNEY. It will be a long while before this plant will be in operation, as I understand it.

The CHAIRMAN. Well, it will be three years before the dam is finished, under the most favorable circumstances.

Senator HEFLIN. I believe you said, Doctor, that you had no faith in the suggestion that it would put the fertilizer factories out of business.

Doctor WHITNEY. Oh, no. I think we need fixed nitrogen and we have got to have a slight readjustment in our fertilizer practice in order to utilize it.

Senator HEFLIN. What is the difference in the average price of fertilizer for 1920 and 1921?

Doctor WHITNEY. Do you mean the commercial fertilizer?

Senator HEFLIN. Yes; what is the difference in the average price of commercial fertilizer for the years 1920 and 1921? The price was considerably lower in 1921, was it not, than it was in 1920?

Doctor WHITNEY. Yes; in 1921 the market went to pieces.

Senator HEFLIN. Have you got the figures?

Doctor WHITNEY. I have not got them.

Senator HEFLIN. Can you get them?

Doctor WHITNEY. No. You see, the fertilizer control law was repealed by Congress in March, 1921, and we dropped out; we dropped all of our contact with it.

Senator HEFLIN. How can we get those statistics?

Doctor WHITNEY. There were no prices, Senator. They were selling fertilizers at all sorts of prices in 1921.

Senator HEFLIN. In the spring of 1921, when the farmers had already bought their fertilizers, the depression had not come on.

Doctor WHITNEY. That is right.

Senator HEFLIN. But after they got the fertilizers then the depression did come?

Doctor WHITNEY. Then it came.

Senator HEFLIN. Now, in the next year it was of little force and effect.

Doctor WHITNEY. Yes.

Senator HEFLIN. Although the price was very much lower?

Doctor WHITNEY. Yes.

Senator HEFLIN. I would like to get into this record, if I could, the prices in 1920 and also in 1921.

Doctor WHITNEY. I can give it to you for 1920 but not for 1921. The figures that we would give you would mean very little, because the market went to pieces, and they sold at any price.

Senator HEFLIN. Well, you stated there that nearly 8,000,000 tons were used in 1920, I believe?

Doctor WHITNEY. Yes.

Senator HEFLIN. And only a little over 4,000,000—

Doctor WHITNEY. 4,500,000 in 1921.

Senator HEFLIN. In 1921.

Doctor WHITNEY. Yes; the prices were so high and the depression was so great, that we urged the manufacturers to lower their prices to get rid of this high priced stock, but they hung on to it.

Senator HEFLIN. Well, the purchasing power, the debt paying power of the farmer having been so reduced in 1921 was the reason, in your judgment, for the falling off in the use of fertilizers for that year, was it?

Doctor WHITNEY. Oh, yes.

Senator HEFLIN. Now, it was claimed by Mr. Ford's friends that he will produce fertilizers, commercial fertilizer, at about half the price demanded of the farmer at the present time. Do you think that is possible, from the use of the water power at Muscle Shoals?

Doctor WHITNEY. Well, I would not like to say. I have never given any consideration to that.

Senator HEFLIN. That is a little out of your field?

Doctor WHITNEY. That is a little out of my field; yes.

Senator KENDRICK. Well, Doctor, it seems to me that we have in this country a supply of potash, and there is apparently an inexhaustible supply of phosphate.

Doctor WHITNEY. Of phosphates.

Senator KENDRICK. Have you any information as to the supply that is in sight of the nitrates that are secured as they are in Chile and other places?

Doctor WHITNEY. It is very doubtful. That is subject to speculation. We do not know; nobody knows. We do not know whether they will continue very long or not.

The CHAIRMAN. At least, we are absolutely under the control of Chile in that respect?

Doctor WHITNEY. Yes, sir.

The CHAIRMAN. She has been charging an export duty on it.

Doctor WHITNEY. Yes; just as there has been a monopoly in the potash field.

The CHAIRMAN. Yes.

Doctor WHITNEY. In Germany.

The CHAIRMAN. I am not complaining of Chile doing that.

Doctor WHITNEY. No.

The CHAIRMAN. But she has been doing it and she is doing it.

Doctor WHITNEY. Yes.

The CHAIRMAN. Do you know what it is now?

Doctor WHITNEY. What the export duty is now?

The CHAIRMAN. Yes.

Doctor WHITNEY. I do not know.

The CHAIRMAN. Do you know that, Major [addressing Major Burns]?

Doctor WHITNEY. It is, in round numbers, \$12 per ton.

The CHAIRMAN. It has been increased from time to time?

Major BURNS. Yes.

The CHAIRMAN. And is liable to be increased at any time?

Major BURNS. Yes.

The CHAIRMAN. Now, Doctor, I would like to ask where the supply of nitrogen comes from that is in the atmosphere? Where does the atmosphere get its supply of nitrogen?

Doctor WHITNEY. Well, that was here originally.

The CHAIRMAN. We just found that here?

Doctor WHITNEY. Yes.

The CHAIRMAN. If the whole world gets out of nitrogen and goes to taking it out of the atmosphere, and if there is no source of supply to replace it—

Doctor WHITNEY. Well, it goes back.

The CHAIRMAN. It does go back?

Doctor WHITNEY. Oh, yes.

The CHAIRMAN. There is not any danger, then, of that supply being cornered?

Doctor WHITNEY. None in the least; no.

Senator HEFLIN. It is made in the chemical laboratory of the skies, is it, Doctor?

Doctor WHITNEY. I presume so.

The CHAIRMAN. Are there any further questions of Doctor Whitney?

Senator HEFLIN. Doctor, how much do we pay to Chile each year for our nitrate supply? Have you got that information?

The CHAIRMAN. I think that is in the record, Senator.

Senator HEFLIN. Is it?

The CHAIRMAN. Did you not put that in the record [addressing Major Burns]?

Major BURNS. No, sir; we did not.

The CHAIRMAN. All right.

Major BURNS. But some other witness did put it in.

Senator HEFLIN. Something was said about that, but I do not recall that the amount was stated.

Doctor WHITNEY. Our pre-war use of nitrate of soda was about 600,000 tons. We used 250,000 tons for agriculture. Those are the figures, as near as we can get at them.

Senator HEFLIN. About how much would that be in dollars and cents?

Doctor WHITNEY. \$50 a ton would probably be a fair average price, would it not, Major?

Major BURNS. It would be 12 times 600,000, or \$7,200,000 a year, roughly, that we pay Chile in export fees. That would be for the 600,000 tons, the entire quantity.

Senator HEFLIN. For the 600,000 tons, the entire quantity?

Major BURNS. Yes.

Doctor WHITNEY. Now, for the agriculture, it is about 40 per cent of that?

Major BURNS. About 250,000 tons.

Doctor WHITNEY. Yes.

Major BURNS. About \$3,000,000.

Senator HEFLIN. That is for agricultural purposes?

Doctor WHITNEY. Yes.

Major BURNS. Well, for agricultural purposes, you are paying about \$3,000,000 to Chile.

Senator HEFLIN. And about \$7,000,000, or a little more, for all produced?

Major BURNS. For all purposes.

Doctor WHITNEY. Yes.

Major BURNS. Fertilizer, as well as the chemical industry.

Senator HEFLIN. Annually?

Doctor WHITNEY. Annually.

Major BURNS. Yes.

Doctor WHITNEY. This looks to me like the opening of a new era. We have to have fixed nitrogen, and it is not altogether adjusted for our present practice. Our past practices have needed changing anyway, and this is a very good time to make the change. The length of time it would take to make this change is going to give everyone (who will be involved personally) ample time to make provision for the change.

The CHAIRMAN. Some question has been raised about a term used in Mr. Ford's proposition, and maybe you will be able to give us some information on that, Doctor. There is some question as to what Mr. Ford, in his so-called guaranty, means when he says that he agrees to operate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizers, said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum. Now, what is ammonium nitrate?

Doctor WHITNEY. Ammonium nitrate is this ammonium gas that is produced from cyanamid. A part of this is oxidized to nitric acid, and nitric acid absorbs an excess of ammonia, making ammonium nitrate. Shall I go ahead on that?

The CHAIRMAN. Yes; go ahead.

Doctor WHITNEY. The capacity of that plant is measured by 40,000 tons of nitrogen. That is the measure of it.

The CHAIRMAN. Then, 40,000 tons of nitrogen is equal to 110,000 tons of ammonium nitrate?

Doctor WHITNEY. Yes; or 190,000 tons of ammonium sulphate, you see.

The CHAIRMAN. In getting this product here that he mentioned, would you get this before you got the 40,000 tons, or would you get that first, and get this afterwards, in your process?

Doctor WHITNEY. Well, I do not know what he means, but I believe that he means that he would make fertilizers on the basis of 40,000 tons of nitrogen or 110,000 tons of ammonium nitrate.

The CHAIRMAN. Is there a difference between those two terms?

Doctor WHITNEY. No; they are equivalent.

The CHAIRMAN. I know they are equivalent.

Doctor WHITNEY. They are equivalent.

The CHAIRMAN. But some doubt was thrown on it and I wanted to find out whether, if this was complied with here, and 110,000 tons of ammonium nitrate were made, from there on what would be necessary to be done in order to convert it into fertilizer. Would that be an expensive process?

Doctor WHITNEY. No; that is one of the constituents here. Now, if he used one of these formulas—I do not know what his methods are going to be at all, but the amount of material that he could make of any one of these would be limited by the amount of nitrogen.

The CHAIRMAN. Exactly.

Doctor WHITNEY. Yes.

The CHAIRMAN. Which is the more expensive, 40,000 tons of nitrogen or 110,000 tons of ammonium nitrate?

Doctor WHITNEY. Well, the 110,000 tons of ammonium nitrate would be more expensive than this, because it has involved a process of oxidation.

The CHAIRMAN. In making the ammonium nitrate mentioned, do you first get nitrate?

Doctor WHITNEY. You first get ammonia.

The CHAIRMAN. What I am trying to find out is, is the 40,000 tons the result of something done with the 110,000 tons?

Doctor WHITNEY. No.

The CHAIRMAN. Well, is the 110,000 tons the result of something done with the 40,000 tons?

Doctor WHITNEY. You get that first.

The CHAIRMAN. You get that first?

Doctor WHITNEY. That is the measure of the capacity of your plant. Now, the 40,000 tons of nitrogen can be converted by processes which involve expense into 110,000 tons of ammonium nitrate.

The CHAIRMAN. When you get that 110,000 tons of ammonium nitrate, what is left to be done, in order to get it ready to mix up the fertilizer?

Doctor WHITNEY. Now, what does he say in his proposition?

The CHAIRMAN. Yes; you may take that up [handing Mr. Ford's proposition to the witness].

Mr. WHITNEY. He says—

The CHAIRMAN. It commences right there [indicating].

Doctor WHITNEY. "The company agrees to operate nitrate plant No. 2, using the most economical source of power, at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other commercial fertilizers (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum)."

I do not know what it means—I have not talked with him at all, but I take it that when you use this as a standard and when he says that he will make commercial fertilizers complete, up to the limit of the capacity of the plant, which is 40,000 tons of nitrogen, he is promising to deliver to you complete fertilizers, the quantity of which is based upon the amount of nitrogen, the capacity of the plant to produce nitrogen.

The CHAIRMAN. Well, Doctor, would there be any difference in this paragraph if, instead of using this clause which is in parenthesis, as follows:

"(said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum)"—

He used this language, "said capacity being equal to approximately 40,000 tons of nitrogen per annum"?

Doctor WHITNEY. I do not think that that would make any difference.

The CHAIRMAN. It means the same thing?

Doctor WHITNEY. It means the same thing.

The CHAIRMAN. Yes.

Doctor WHITNEY. The question is whether he is pledging himself to make mixed fertilizers up to the capacity of 40,000 tons of nitrogen, which the plant has. Now, in connection with this I understood from a statement of Mr. Mayo before the House Committee on Military Affairs, page 977 of hearings, that the total amount of mixed fertilizers that he contemplates making under that provision is, according to its formula, 2,000,000 tons of completed 2-8-2 fertilizer.

The CHAIRMAN. Is that right?

Doctor WHITNEY. Yes.

The CHAIRMAN. With 40,000 tons of nitrogen, about how many tons of commercial fertilizer could you make?

Doctor WHITNEY. Well, that depends upon your formula. Now, he gave that, Mr. Mayo, gave it in his statement, and, according to the ratio of nitrogen to the other constituents, in 2-8-2 it is 2,000,000 tons that would be made out of this 40,000 tons of nitrogen.

The CHAIRMAN. I see; yes.

Doctor WHITNEY. Yes.

The CHAIRMAN. Doctor, I think that is all that we wanted to ask you, unless you have something further that you wish to state.

Doctor WHITNEY. No; I think not.

The CHAIRMAN. We will adjourn here until 2 o'clock.

(At 12.40 o'clock p. m. the hearing was adjourned to 10.30 o'clock a. m., Monday, May 8, 1922.)

MUSCLE SHOALS.

MONDAY MAY 8, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m., in the hearing room of the Committee on Commerce, United States Senate, Capitol Building, Senator George W. Norris presiding.

Present: Senators Norris (chairman), Keys, Gooding, Norbeck, Kendrick, Harrison and Heflin.

The CHAIRMAN. The committee will come to order.

STATEMENT OF DR. CHARLES L. PARSONS, CONSULTING CHEMIST, WASHINGTON, D. C.

The CHAIRMAN. Doctor Parsons, we have been considering for some time the various bids that have been made for this Muscle Shoals project by private parties. We would like to hear you this morning on your bid. First tell the committee just who you are and something about yourself, so the record will show.

Doctor PARSONS. It depends somewhat on what you desire. I did not understand I was called here this morning with reference to the bid I had made. Your letter stated that you wanted me to come and testify as a chemist, as I have before some of the other committees.

The CHAIRMAN. We will be glad to have you do both.

Doctor PARSONS. In the first place, may I give a statement in a brief way as to what my experience has been along these lines. So far as the bid itself is concerned, that is quite a different matter.

The CHAIRMAN. Yes, sir.

Doctor PARSONS. I first came in touch seriously with the nitrogen situation when, in 1916, I was selected by the War Department to go abroad and study the situation for them as their chief chemical engineer, being at that time chief chemist of the Bureau of Mines, and transferred to the War Department for that purpose.

I went abroad and visited various plants, consulted with the nitrogen experts of England, France, Italy, Norway, and Sweden, and returned to this country in December, 1916, and made my report to General Crozier. The report which I made did not agree entirely with a report which had been made by a committee of the National Academy, and they appointed a second committee to coordinate the two reports, and that committee essentially adopted mine, practically unanimously. It consisted of a larger portion of the members of the National Academy Committee, of Doctor Hilebrand of the Bureau of Standards, who had been added thereto, Admiral Earl, General Crozier, General Wheeler, and myself. They came to their final conclusion in May, 1917, and made a report with reference to the installation of what was afterwards plant No. 1, making the recommendation that it be located in southwest Virginia or contiguous territory, behind the mountains.

I was afterwards called into the Ordnance Department's first conference when later the emergency arose which necessitated the rapid increase in plants for the fixation of nitrogen. I was at their first meeting, in October, 1918, and differed from everyone else there with reference to the crying necessity for the building of plant No. 2: put my opinion on record in writing the next day with General Crozier and had nothing to do with plant No. 2 thereafter.

I was, however, a member of the nitrate commission established by the War Department, consisting of Admiral Earl, W. R. Whitney, A. A. Noyes, Gano Dunn, and E. E. Summers, to whom the chief technical questions were referred thereafter whenever they felt there was a necessity for further action. For example, the question of where plants Nos. 3 and 4 should be located and the processes which plants

Nos. 3 and 4 should use was referred to us when the War Industries Board concluded that further plants were necessary. At that time I, with the others, voted for the building of those plants for operation by the cyanamid process, although we did not select the sites which were afterwards chosen. The vote for the cyanamid process at that time was based solely on the question of availability and ability to put the plant in rapidly with certainty of a product. It was definitely stated in that vote that this was done without reference to cost, it being conceded that the cost would be greater than by some other and more modern processes.

Since the war I was for about a year—a little over a year; in fact a year and five or six months—connected with the Atmospheric Nitrogen Corporation in a consulting capacity. This corporation built a very successful plant at Syracuse, working by a modified Haber process, the same process as was installed in plant No. 1 at Muscle Shoals. That plant functioned from the first minute it started and has run steadily from last August up to the present time with an output of something like 20 per cent or 25 per cent in excess of its rated capacity, and is running to-day very successfully at Syracuse.

My connection with the Atmospheric Nitrogen Corporation—

The CHAIRMAN. What is its capacity?

Doctor PARSONS. It was a 10-ton plant, and it is turning out over 12 tons of ammonia every day.

My connection with them ceased shortly after the plant was in operation.

The CHAIRMAN. That is a privately owned plant?

Doctor PARSONS. That is a privately owned plant; yes, sir.

The CHAIRMAN. The Government had nothing to do with that?

Doctor PARSONS. The Government had nothing to do with that plant, but there was no question whatever but that it was able to run successfully from the start on account of the experience which was gained in the first operation of plant No. 1 at Muscle Shoals. That is the only important relation between the two. It is built by essentially the same process, with a change in the catalyst and a strengthening and alterations of the machinery, and is functioning very successfully to-day.

Major Burns has been through it and has undoubtedly already spoken to you regarding the operations of that plant at Syracuse. My connection with it ceased last August and at the present time I have no connection with anyone interested in developing plants for the fixation of nitrogen. I am now simply a consulting chemist, and I am here absolutely as a free lance, to give you my testimony.

The CHAIRMAN. I think, Doctor, you had better state for the record a little more of your own personal history. How old are you, first?

Doctor PARSONS. I am 55 years old.

The CHAIRMAN. Tell the committee about your business, where you were educated, and what you have been doing.

Doctor PARSONS. I am a graduate of Cornell University. I have honorary degrees from the University of Maine and the University of Pittsburgh. I was professor of chemistry in the New Hampshire College until 1911, when I came here as chief chemist of the Bureau of Mines. I was with the Bureau of Mines from 1911 until November 1, 1919, as their chief chemist, and chief of the Division of Mineral Technology. I had full charge of the radium work—of which you have undoubtedly heard much—of the Bureau of Mines, getting about a million dollars' worth of radium for a net cost of \$350,000. I had full charge of the building of the cyanide plant at Saltville during the war, in order to produce sodium cyanide for the production of poisonous gases, having \$2,800,000 put aside for the building of that plant by the War Department, and having practically full charge of it, with 350 officers and men reporting to me in connection with that plant.

That plant functioned from the first, and you have never heard anything about it in any of your hearings, but what it was absolutely all right. It was never questioned and had absolutely a clean bill of health from the board that examined it. The plant was a success from the day it began operation.

The CHAIRMAN. Doctor, we have learned from our experts that nitrate plant No. 1 at Muscle Shoals, the small plant using the Haber process, has been a failure so far as the production of nitrogen is concerned. Tell us about that.

Doctor PARSONS. I rather deplored the general idea around that plant No. 1 has been a failure. I do not consider it so at all. It is true that plant No. 1 never produced any considerable amount of ammonia, but it would have done so, and would have done so successfully, had it been somewhat remodeled. That has been definitely proved by the fact that this plant at Syracuse, which is simply an outgrowth of that, is the only successful plant for the fixation of nitrogen in America to-day, and is in entire accord with the plants in Europe which are operating along the same lines. These are the only successful plants in the world to-day for the fixation of nitrogen where their investment has not been written off by war profits.

Plant No. 1 at Muscle Shoals is operated by what is known most correctly as the synthetic ammonia process, first known as the Haber process, which has three modifications now successfully operating. One of those, the Haber process per se, is operating in Germany to the extent of 300,000 tons of fixed nitrogen per year, which is equivalent to over 1,500,000 tons of ammonium sulphate; two plants in Germany operating by that process giving that total amount. That plant operates at pressures between 100 and 300 atmospheres; that is, the patents cover those pressures. They are actually running at about 200 atmospheres pressure, which is about 3,000 pounds per square inch.

The Claude process, developed in France, is using exactly the same chemical reaction, but it has escaped some of the elaborate apparatus by developing better mechanical devices and operating at very high pressure. It actually operated at 900 atmospheres pressure, which is 13,500 pounds per square inch. Their patents cover the right to operate between 300 atmospheres and 2,000 atmospheres, but when I last saw it, it was operating at pressures around 900 atmospheres.

The CHAIRMAN. Where is that located?

Doctor PARSONS. That is at Montereux, about 40 miles outside of Paris.

The CHAIRMAN. Was that built during the war?

Doctor PARSONS. No, sir. It was built since.

The CHAIRMAN. What is its capacity?

Doctor PARSONS. It is only a small plant. I think the average capacity is about 5 tons a day. The great difficulty which they are having in France, which is a difficulty which I will lead up to shortly with the Haber process, is their inability to get hydrogen pure and cheaply. Otherwise the plant is running very smoothly. I have never been in a plant that was running more smoothly and easily than that plant. I was profoundly impressed with the very small number of workmen they have in the plant. There were only three or four in it, and they were sitting around in chairs reading newspapers just exactly as men would do in electric-light stations. The machinery was turning perfectly smoothly. They once in a while got up and went to look at gauges, but that was apparently all they had to do. That impressed me a great deal. The ammonia was turned out as liquid ammonia rapidly. I saw them taking it out in cylinders frequently while I was there.

Then there is a third process, known as the General Chemical Co. process, whose patents cover lower pressures from 100 atmospheres down. They operate a little under 100 atmospheres. It was that process which was the only one of the Haber processes of which we could have knowledge and which they had operated only in a small experimental plant, giving out a few pounds of ammonia per day. That was the only knowledge that we had to go on when we first decided to make a trial of that process in plant No. 1, which was to have gone to North Chattanooga as we supposed.

The CHAIRMAN. And which did, in fact, go to Muscle Shoals?

Doctor PARSONS. It went to Muscle Shoals by the President's order against the advice of every technical board that had anything to do with the situation.

The CHAIRMAN. Perhaps it would be well to explain that point. Why was it desirable to go to this place in North Chattanooga in preference to Muscle Shoals?

Doctor PARSONS. If you will allow me to finish this other I will come to that in a moment.

The CHAIRMAN. All right; go ahead.

Doctor PARSONS. The plant at Muscle Shoals was advisedly a trial operation. The Germans in starting their first Haber plant had built and destroyed and built again a number of times. When the war came on they were just ready to go ahead with the Haber process, having got it up to a point where they were producing some 6,000 tons of ammonia per year by the plant which they had. They had been working on it for years. I saw the first experimental work, shown in this country, in New York, in 1912, at the International Congress of Pure and Applied Chemistry. It was then considered a very great advance in chemistry. It was two or three years after that before they got any production, and they had been then working on it for a considerable number of years.

The fact that within a year we were able to construct at Muscle Shoals this unit—only about a 10-ton unit, if I remember correctly—at plant No. 1, although it was intended to be increased to a 30-ton unit, and found that we got all of the information which was necessary to reconstruct the plant and build an absolutely successful plant does not indicate to me that plant No. 1 was a failure but shows to me very plainly that it was about as successful a trial experiment as one could hope to make in such an immense undertaking. That was the purpose for which the committee originally advised the building of the plant.

Now, to come to your question as to why the board advised North Chattanooga.

It was very carefully considered, and the first and basic consideration was a consideration which is just as applicable to-day and which is at the basis of all of this publicity and propaganda, namely, that power has very little relation to the question of cheap fertilizer production; therefore it was not considered necessary in any way to append plant No. 1 to any power site. It was deemed advisable, firstly, to put it behind the mountains, where in case of attack it would be relatively free from foreign invasion, and, secondly, it was desired to get it very close to the coal mines and to the possibility of sulphuric-acid production. We looked for supplies of pyrite and supplies of coal. We thought at first it should go down into southwestern Virginia, and several trips were made through that country in an attempt to find a site for it, but we were unable to find sufficient level ground for a plant of this proposed development and the powder plant which the Ordnance Department wanted to go with it in time. The only site that could be found was down farther south. They finally decided upon and recommended North Chattanooga, Tenn., which was behind the mountains, which was well defended, which was right at the end of a railroad which could bring sulphuric acid from Copper Hill, the largest sulphuric-acid plant in the world, and was close to large deposits of coal. That was the basic reason for having the plant go to North Chattanooga. That was the reason why all three of the Secretaries making the inter-departmental committee that was supposed to decide the location of the plant voted unanimously for North Chattanooga as the site. As I happened to be present at that final meeting representing Secretary Lane, who was called out of town and who gave me his written vote to carry over and instructions to give his reasons for it, I am quite sure of my facts.

The CHAIRMAN. Now, why was it decided that it should be placed at Muscle Shoals instead of North Chattanooga? What was the argument for that?

Doctor PARSONS. Why, I think you will have to go back to Mr. Graham's hearings on war expenditures. It was sent to Muscle Shoals by the President's order. That is all we know.

Senator KENDRICK. Is it not likely that it was sent there on account of the power that was expected to be derived from that dam?

Doctor PARSONS. Every board had passed on the fact that power was not necessary.

Senator KENDRICK. Well, but we have heard nothing else since we began this investigation but the fact that the cyanamid plant could not be operated on steam power; that it would take cheaper power to operate.

Doctor PARSONS. We have heard nothing else; that is quite true, Senator.

The CHAIRMAN. I think it ought to be said that we have not heard, or at least I have had the idea from the beginning from our experts, that in the Haber process, so-called, power was just an incident of no particular importance.

Doctor PARSONS. Just about as much importance as it would be in the ordinary factory?

Senator KENDRICK. I know, but the whole contention has been that that process was a failure; that is, that the plant we had at Muscle Shoals was a failure, and that we were going to depend upon the cyanamid plant to get our materials.

The CHAIRMAN. Yes, of course; but if, as a matter of fact, power is not at all necessary in the Haber process, that would be no argument to put it at Muscle Shoals as far as I can see, and I did not suppose that was the argument. I never knew why it went to Muscle Shoals.

Doctor PARSONS. You will find a good deal about that in Mr. Graham's testimony. You will find in the House testimony facts and statements of how those things came about and how everybody was surprised, and how General Crozier wrote across the bottom, "Ordered to Muscle Shoals by the President," and that is all we know about it. We do not know that there had been great demands to have Muscle Shoals developed for three or four years before, and, as I mentioned a moment ago—and I can not dwell on that too strongly, and I hope Senator Kendrick will get this clearly in mind—the relation between power and cheap fertilizer is a mere shibboleth. Those interested in the power, and especially land speculators, have painted a beautiful mirage for the farmer, which will fade utterly on approach.

The CHAIRMAN. Doctor, that is not true, is it, in regard to the cyanamid process?

Doctor PARSONS. The cyanamid process is in a state of obsolescence. The plants in France, in Italy, in Dalmatia, in Silesia, in Norway, in Sweden are closed down. The plant in Canada is not producing cyanamid for fertilizer purposes, but in small quantity for the manufacture of urea, which is used in this celluloid material which goes into automobile windows, and in producing sodium cyanide, from which is made hydrocyanic acid, for killing insects on citrus trees in the West. The plant is running only on a very small output. In the main the cyanamid process is essentially already obsolescent.

Senator KENDRICK. That is all very true, Mr. Chairman, and I am ready to concede that, but the question has been asked here as to why the plant went to Muscle Shoals. Now, my brief trip down there in that country convinces me that it was in view of the fact that at that particular time we were depending upon the cyanamid process, and the further fact that we agree that it did cut an immense figure—that is, that the power did cut a big figure in the production of nitrates in the cyanamid process.

The CHAIRMAN. Yes; Senator, that is true; but that does not apply to the Haber process.

Senator KENDRICK. If I had gone down and looked at it myself with no information whatever as an engineer, I would have put it at Muscle Shoals on that basis. I never dreamed that there was a place in the country—that is, in the eastern part of the country, where it was possible to develop the power that can be developed at Muscle Shoals with water.

The CHAIRMAN. I think we all agree with that, Senator, and we all agree also that it was necessary in the cyanamid process that that be located at a great power site and that is why plant No. 2 was located there, very properly. But I do not see that it has any application whatever to plant No. 1.

Senator NORBECK. May I ask one question, Mr. Chairman, as to this power? I wish, if it is possible to have these figures in the record, to know what per cent of the cost would be power.

Doctor PARSONS. I can give you that, and then I think I can clear up this other point also.

Senator NORBECK. Would you do that and hand it to the clerk?

Doctor PARSONS. It will take me just a moment.

(A short recess was here taken to enable the members to answer roll call in the Senate.)

Senator NORBECK. Senator Heflin, Senator Kendrick has suggested here the question of trying to determine the relative importance of power in the manufacture of fertilizer under the different processes, and I am just calling your attention to that because I know it is something you are vitally interested in.

Doctor PARSONS. First, if you will allow me, before I come to your question, I will take up the point which Senator Kendrick made, and that is with reference to this plant going to Muscle Shoals. You understand that plant No. 1 was decided upon many months before there was any real emergency. Plant No. 1 was decided upon with the idea of filling the needs of the national defense act, to give both a supply of nitrogen for explosives and a supply for fertilizer purposes. Therefore, with that plant, as power was not at all important, there was no question of putting it at a power site. When plant No. 2 afterwards was decided upon some nine months later a very different condition of things had arisen. At that time we were very greatly pressed by the German submarines, and there was a distinct fear that we would be cut off from the Chilean nitrate fields, therefore it was necessary to put in as a measure for war purposes solely plant No. 2.

Senator KENDRICK. I want to substantiate that statement because of a personal experience. The most gloomy time that ever I saw during the war was when the members of the Military Affairs Committee told me that there was a very good chance for us to be cut off from Chilean nitrates.

Doctor PARSONS. Plant No. 2 was put at Muscle Shoals basically because plant No. 1 had been already ordered there by the President. Even at that time there was perfect knowledge that there would be no power available for plant No. 2 at Muscle Shoals until after the war was over, for it was estimated it would take from five to six years to complete the dam. That is why they put in plant No. 2, which was solely a war plant and was never expected to serve for fertilizer production, and fertilizer production was not mentioned at the conference in the Ordnance Department that night, at which I was present. They put it at Muscle Shoals and then built the steam plant and arranged with the Alabama Power Co. for the transmission of power from the Warrior River, 80 miles away, so that plant No. 2 could be quickly operated. So, you see, there is very little connection between fertilizers and this plant in any way. I can not see how they are connected at plant No. 2, because at plant No. 2 they have all the power that is needed from the steam plant, and it has had all the power it needs from the steam plant for its operation since plant No. 2 was finished. They were built at Muscle Shoals probably with the idea of having them built there so Muscle Shoals would ultimately be developed.

But the basic point which I want to bring out strongly in my testimony, which I am anxious you all should get, which can be demonstrated, and which has been acknowledged, I think, by every board which has passed on the matter, is that cheap fertilizer and cheap power are not closely related.

Senator KENDRICK. I am glad to hear you say that, Doctor, because that is the very first intimation or mention of anything of that kind that this committee has had.

Doctor PARSONS. Now, as to these processes. The Haber process requires about 0.25 to 0.3 of a horsepower year per ton of nitrogen. The cyanamid process—

Senator NORBECK. Not per daily ton? That is per year?

Doctor PARSONS. No; per year.

The cyanamid process requires approximately 10 times that amount, or two and one-half horsepower years per ton of nitrogen fixed.

The arc process, which is developed in Norway, requires 10½ horsepower years per ton of nitrogen fixed. It is due to the fact that those immense Norwegian plants (which were the first ones to be built, and which were built for the manufacture of nitric acid to be made into calcium nitrate for fertilizer purposes) require such immense power that there is the public idea to-day that power and cheap fertilizers are connected. But those plants in Norway to-day would, if it were not for the Haber patents, stop using that power in the way they do and use it through another method.

Senator NORBECK. And that would possibly mean the relocation of the plants at other places than near water power?

Doctor PARSONS. Not necessarily. I will later show you where water power may be used with the Haber process. According to one of the engineers connected with the plant, if it was not for the Haber patents their inability to use them (which we can use) in Norway they would probably abandon their present method and would use that power, which is very cheap power (less than \$5 per horsepower year) for electrolyzing water to give them the hydrogen which is necessary for the production of ammonia through the Haber process.

The basic raw materials used in the Haber process are nitrogen and hydrogen. The nitrogen can be obtained cheaply and easily in the uncombined form from air through liquefying plants at a cost of approximately 10 cents per thousand cubic feet, so that it does not come seriously into the cost situation. The hydrogen, on the other hand, is the basic and most expensive constituent of ammonia, and it is the most costly to procure. It can be procured in two ways. One is from coal and water, as it is produced in Germany, as it is produced in Syracuse, and as they will produce it at Billingham, England, where there is a hundred-ton plant being erected. These plants operate by simply passing water over red hot coal to make water gas, then passing that water gas mixed with a little steam at proper temperatures over a mixture of iron oxide and chromium oxide, thus getting a secondary reaction to take place which gives you hydrogen, carbonic-acid gas, and carbonous-acid gas. The carbonic-acid gas can easily be removed from the hydrogen, but the carbonous-acid gas can not be so easily removed. The removal of carbonous-acid gas, or carbon monoxide, which is poison to the catalyst, is the most expensive part of that procedure. Secondly, you can pass an electric current, which, of course, must be produced by power, through water and electrolyze that water into two gases—hydrogen and oxygen. Now, you can afford to use water power to produce hydrogen by that method, where you can get water power for around \$10 per horsepower year or less, but with power much above this price you are forced to make your hydrogen from coal and no one has ever hoped to produce the primary power for this cost price at Muscle Shoals. Colonel Cooper places the price of the secondary power at 1.2 mills per kilowatt hour.

Senator NORBECK. What does that make per kilowatt hour?

Mr. LEVERING. A trifle over a mill.

Senator NORBECK. That would be your answer, a trifle over a mill?

Doctor PARSONS. Yes; \$10 per horsepower year is a trifle over a mill per kilowatt hour.

Senator NORBECK. Assuming that the product is a certain price per ton now—you are familiar with the market—and the best method of manufacturing it by the cyanamid process was used, what would be the difference in the cost of the product between one mill horsepower, say, and ten mills horsepower?

Doctor PARSONS. By the Haber process?

Senator NORBECK. Well, I want to get both processes.

Doctor PARSONS. By the Haber process it would be absolutely impossible to use it, at the latter figure. It would put the cost of hydrogen up so high that it could not be considered, because there the power is a very great factor, if you are going to use that method.

Senator NORBECK. I understood you to say that in Norway they had in mind using power in connection with the Haber process.

Doctor PARSONS. They have in mind using that power for the electrolysis of water, which I have explained, if they could get around the Haber patents.

Senator NORBECK. If we can get around the Haber patents, then our water power at Muscle Shoals or anywhere else would be a cheapening factor in the manufacture of fertilizer under the Haber process? Is that the answer?

Doctor PARSONS. No; it would have to be much cheaper than you have it. As I say, if your water power is a mill per kilowatt hour or \$10 per horsepower year, you can use it. With any power less than that you can afford to make your hydrogen by that method, and use the Haber process. If you have to pay much more than that for your power you would make your hydrogen by coal, because it would be cheaper to do it.

Senator NORBECK. We have two processes before us that we are really talking about, because we have two plants, one built to manufacture under the one and the other under the other. The point I am very anxious to get in terms that I can understand is how much could we cheapen the fertilizer by either process by free power, or from commercial power, say, costing a cent per kilowatt?

Doctor PARSONS. That is a pretty broad and extensive subject.

Senator NORBECK. Is it a dollar a ton or \$20 a ton? Some men think here that fertilizer could be produced and the price reduced one-half by cheap power. If so, we want to know it.

Doctor PARSONS. I understand that Mr. Mayo stated that Mr. Ford is going to make 2,000,000 tons of 2-8-2 fertilizer per year and reduce its price to one-half or even to one-third. You could put all the nitrate that you could manufacture in plant No. 2 into that amount of fertilizer for nothing and it would not reduce the cost one-third.

Senator HEFLIN. That is rather a strange situation. I got the impression from what he said, Senator, that he could pay \$100 a horsepower or \$5 a horsepower, and it would not make any difference if he manufactured fertilizer; one will do it just as cheaply as the other, paying \$100 or \$5.

The CHAIRMAN. Oh, I did not get that idea.

Doctor PARSONS. Not at all, Senator. What I am saying is this. I am talking about the Haber process only.

Senator HEFLIN. The impression made on my mind was that the price of horsepower did not have anything to do with it. Whether he uses high horsepower to produce the fertilizer or low horsepower, he could sell it at the same price?

Doctor PARSONS. The amount of power which is necessary to operate by the Haber process is approximately three-tenths of a horsepower year per ton of nitrogen fixed. That is all that is really required. The question is to get cheap hydrogen, which is the basic raw material used in the Haber process. Now, if you happen to have power that is less than \$10 per horsepower year you can probably obtain that hydrogen cheaper than you can from coal, but you would not wish to pay more than \$10 per horsepower year, because at that price you can make your hydrogen by an entirely different method requiring no power from coal, so that your hydrogen, which is the basic material, can be made with or without power. You can not afford to pay more than that, because you can get it without the horsepower at all.

Senator NORBECK. Will you pardon me if I ask this question over once more at least, to get it clear in my mind.

Suppose the Government furnished free power for the manufacture of fertilizer under the cyanamid process; would it reduce the cost of fertilizer \$1 a ton or \$10 a ton or \$20 a ton?

Doctor PARSONS. Why, that has been brought out in the hearings. I think Major Burns said—

Senator NORBECK. It has been touched upon, but we would like to have your opinion on it.

Doctor PARSONS. My opinion is if you gave the power for nothing and paid a bonus on top of it of pretty nearly the price that you are counting on for your power down there, say \$10 per horsepower year, you can not fix the nitrogen by the cyanamid process in competition with the Haber process without sensible power requirements.

Senator NORBECK. Admit all that. That does not answer my question.

Doctor PARSONS. I am trying to answer it.

Senator NORBECK. I am trying to find out what per cent of the cost per ton is power under the cyanamid process.

Doctor PARSONS. I should have to do some figuring before I could tell you.

Senator NORBECK. Would you be willing to put that in the record?

Doctor PARSONS. Yes, sir. I can not tell you offhand.

(The statement requested was subsequently submitted by Doctor Parsons and is here printed in full as follows:)

"It requires approximately 3,000 kilowatt hours to make 1 ton of ammonium sulphate by the cyanamid process. Therefore, at 1 mill per kilowatt hour the cost for power per ton of ammonium sulphate would be \$3, or at 4 mills \$12. If the power, therefore, cost nothing it would reduce the cost of ammonium sulphate \$3 in the first case or \$12 in the second. As a commercial fertilizer of 2-8-2 grade contains only 10 per cent of ammonium sulphate, the difference between charging 1 mill per kilowatt hour or furnishing the power free would make a difference in cost of the mixed commercial fertilize: of only 30 c nts."

Senator KENDRICK. It is a great deal more than the price that enters into the cost of production under the Haber process.

Doctor PARSONS. I think that condition is shown abroad clearly in the cyanamid plant which has just been scrapped at Odda, Norway. That plant is from one-third to one-half the size of the plant at Muscle Shoals. It is a modern, up-to-date cyanamid plant, the best cyanamid plant I have ever been in with the exception of that at Muscle Shoals. It is a first-class cyanamid plant. Their power was costing them \$7.20 per horsepower year, as I understand.

The CHAIRMAN. That would be less than a mill per kilowatt hour, would it not?

Doctor PARSONS. Yes.

Senator NORBECK. They found they could not make it?

Doctor PARSONS. They sold that plant on the 11th of last February, a plant which cost several million dollars, under bankruptcy proceedings for \$10,000, or 50,000 kroner.

Senator NORBECK. It was not a Government-owned plant?

Doctor PARSONS. It was a privately owned plant. They simply could not continue the production in competition with the Haber process on the other side. They sold most of their ammonia to the big plants at Rjukan, who wanted to make ammonium nitrate. The ammonia from the plant at Odda, which was comparatively near by could not compete with the Germans. The Germans were able to lay down from the Haber plant in Merseburg in 40-ton tank cars, liquid ammonia below the price that these people could make it in Norway, even on the basis of that very low-priced horsepower. They closed and sold the plant in order to pay the power company's bills, and are hoping that they can make arrangements to use that power which is less than 1 mill per kilowatt hour to produce hydrogen electrolytically, and put in a Haber plant in Norway.

The CHAIRMAN. Doctor, as I understand you, your opinion is that our plant No. 2, the cyanamid plant, is of no value whatever except as a war proposition?

Doctor PARSONS. Quite right. Well, I would like to modify that just slightly. I don't wish to say it is of no value whatever, because it is quite possible that the furnaces might be used to a limited extent for the production of calcium carbide and acetylene, for which there is a certain limited market in the South. Of course we have rather large plants up here along the Canadian line for making that material. It is possible, also, that those same furnaces might be utilized for the electrothermal production of phosphoric acid, but that is still a problematical question. There are three plants now built for the production of phosphoric acid electrothermally, and two of them are operating and—the third although recently finished by the American Cyanamid Co. is not operating. They manufacture phosphoric acid not for fertilizer purposes, because they have not manufactured it cheaply enough, but to be used in baking powders and in soft drinks for soda fountains and the like. They are making a pure high grade phosphoric acid which brings a much higher price.

The CHAIRMAN. Let me put my question again in a little modified form.

Is it your judgment plant No. 2 at Muscle Shoals is of no value whatever as a fertilizer proposition?

Doctor PARSONS. Plant No. 2 at Muscle Shoals, in my opinion, is of no value whatsoever as a proposition for the fixation of nitrogen. I am not prepared to state definitely that some of the furnaces there might not be made, with cheap enough power to turn out some phosphoric acid.

The CHAIRMAN. That would be another ingredient of a fertilizer?

Doctor PARSONS. Yes; that would be another ingredient of fertilizer; but that is entirely problematical. I doubt if anybody knows. It never has been done.

The CHAIRMAN. The machinery would not have to be changed to do that would it?

Doctor PARSONS. The electric furnaces which are there could be used in essentially the same form, but it would take a very small part of the plant, you know.

Senator NORBECK. What per cent of the value would be the electric furnace? Would it be 1 per cent, or would it be much less or much more?

Doctor PARSONS. Of course the question of cheap power in the problematical method of procedure is a very important factor, and the furnace is simply built up out of fire brick.

Senator NORBECK. The cost of the furnace is a very tiny part of the cost of the plant, is it?

Doctor PARSONS. Of the whole plant?

Senator NORBECK. Yes.

Doctor PARSONS. Comparatively a small part, still it is rather costly to build good electric furnaces.

Senator NORBECK. Is the furnace worth a million dollars?

Doctor PARSONS. Oh, no.

Senator NORBECK. Is it worth \$100,000?

Doctor PARSONS. No. It is just a matter of a few thousand dollars.

Senator NORBECK. It is a very small percentage of the value of the plant.

Doctor PARSONS. Yes, sir.

Senator NORBECK. And that might be made use of?

Doctor PARSONS. That may be used; yes. Mr. Swann proposed that, and I have no exception to take to his statement except, like many other statements, they are simply what he hopes he can do. The Bureau of Soils has been working at phosphoric acid for five or six years. Phosphoric acid has not been, up to the present time, produced cheap enough by the electric furnace method to be sold and put on the market in competition with commercial fertilizer.

The CHAIRMAN. Now, as I understand you, going again to the Haber process as it now used and operated, for instance, at Syracuse, N. Y., the question of power is so small an item that it is not worthy of consideration, but there might be a modification of that method where power might be used very properly, if it was cheap enough, in securing the necessary hydrogen?

Doctor PARSONS. Yes; but there I want you to understand that that must be a very cheap power. I don't believe it is going to be possible—

The CHAIRMAN. That is, cheaper than we have at Muscle Shoals?

Doctor PARSONS. All except your secondary power; yes. The first 100,000 secondary power might, in my opinion, be utilized well for the operation of a Haber plant erected on the site of plant No. 1, and it is on that account that I made this offer. The offer which I made is based solely on the contingency that the Government comes to the conclusion that it will either accept the Alabama Power Co.'s offer and will have this 100,000 horsepower available as secondary power or that the Government itself builds the dam and has that 100,000 of secondary power available for sale.

In my opinion there is no other water power at Muscle Shoals which can be economically and properly used in the production of fertilizers, either by phosphoric-acid method or by the Haber method or by any method known to-day.

The CHAIRMAN. Your offer is not to be considered, then, if the committee decides to accept the offer of Mr. Ford or of Mr. Engstrom?

Doctor PARSONS. It has no bearing on it whatever.

The CHAIRMAN. I think, Doctor, you had better put your offer in the record. You have not done that yet.

Doctor PARSONS. I would like to take only a moment to read this offer to you, with possibly questions on it, so that you can get a clear understanding of it.

The CHAIRMAN. All right.

Doctor PARSONS. I have tried to make it a straight out business proposition and nothing else, and I am willing to explain anything in connection with it, but I want to say frankly that I do not see that there is any possibility that the basic condition is going to immediately arise by which there is any possibility of your accepting this offer, so therefore I have made no attempt to press it. It is simply a proposition that if you have 100,000 secondary power for sale at a price of 0.75 mill (proposed as a basis of cost estimate by the Ordnance Department and the Nitrogen Fixation Laboratory), I should like to have that 100,000 secondary power at that price and plant No. 1 at the price estimated by the Ordnance Department. If I can get them I can get the necessary funds to put it through and run a successful nitrogen-fixation industry which will produce nitrogen as cheaply as it is produced anywhere in this country.

Senator NORBECK. May I ask him in this particular case what do you mean by secondary horsepower?

Doctor PARSONS. The secondary horsepower is that portion of the power which is not available for 12 months of the year.

Senator NORBECK. Yes; I understand, but secondary power can be that power which is available for 11 months, 9 months, or 6 months. Which is it you want?

Doctor PARSONS. The 10 months' power. That is brought out in my offer.

Let me read my letter to the Secretary. [Reading:]

MARCH 23, 1922.

HON. JOHN W. WEEKS,

Secretary of War, Washington, D. C.

MY DEAR MR. SECRETARY: I am handing you herewith an offer covering certain of the properties at Sheffield, Ala., and the first 100,000 kilowatts of secondary power to be derived from the proposed water-power development at Muscle Shoals, which I trust may receive your favorable consideration and the favorable consideration also of Congress.

You may or may not be aware that for several years I have been in close touch with the fixed-nitrogen situation, both in this country and abroad; first, as chief chemical engineer of the Ordnance Department, transferred thereto from the Bureau of Mines at General Crozier's request to make a study of the European nitrate situation

preliminary to the installation of nitrogen-fixation plants in this country, and, later, throughout the war, as a member of the nitrate commission in frequent consultation with Secretary Baker, Assistant Secretary Crowell, and the officers of the Ordnance Department, especially those of the nitrate division. I have since made three trips to Europe and have kept in constant touch with the advancements in nitrogen fixation and with the individual engineers, chemists, and chief executives of many of the fixed-nitrogen plants abroad as well as in this country. I have the necessary experience and knowledge of new methods to direct the design and installation of a synthetic-ammonia process at plant No. 1 which will operate commercially. The patent situation offers no difficulties.

I have constantly advised that the cyanamid process was becoming obsolescent while the synthetic-ammonia processes—variously designated under the names of Haber process, the Claude process, and the General Chemical process—were rapidly becoming the sole commercial procedure for the fixation of nitrogen for fertilizer and explosive use. The practical obsolescence of the cyanamid plants throughout the world, as detailed in my recent testimony before the Military Affairs Committee on March 13, is in entire accord with my prediction. The remarkable success of the General Chemical Co.'s synthetic-ammonia process in its second installation at Syracuse entirely justifies its first trial installation at plant No. 1 at Muscle Shoals. The fact that a plant to produce 100 tons of fixed nitrogen per day is on the way to completion, using a similar process, at Billingham, England; the fact that an immense cyanamid plant at Odda, Norway, nearly one-half the size of the cyanamid plant at Muscle Shoals, was sold on February 11 for 50,000 kroner, approximately \$10,000 present exchange or \$16,000 at normal exchange; the fact that this Norwegian plant is planning to convert its water power to exactly the same use I suggest in the accompanying offer, using a synthetic-ammonia process; and the fact that installations of similar synthetic processes are under way in France, Italy, and Japan, is proof of the correctness of the stand I have always taken.

In order that the accompanying offer may not exclude anyone who may differ from me as to the possibility of operating commercially for cyanamid at plant No. 2, provisions are made so that this plant may be operated by others if the Government so elects and can find lessees therefor.

This offer is made with the intent of developing at Muscle Shoals an industry for the fixation of nitrogen which has possibilities of a greater output of fixed nitrogen than can be produced at plant No. 2. It contemplates the production of calcium carbide and of acetylene therefrom for use in autogenous welding. These products will be made especially with a view to the utilization of a part of the oxygen gas produced, otherwise as a waste product, in the electrolytic production of hydrogen. In view of the extended discussion in the public press of philanthropic fertilizer production, I wish to state frankly it is intended to operate these plants for business purposes, with the expectation of a fair business profit.

If the offer is accepted and the water power is allocated to the company which I will form, plant No. 1 will be converted into a plant for the fixation of nitrogen by the Haber process or a modification thereof. This process is turning out to-day in Germany 300,000 tons per annum of fixed nitrogen, equivalent to nearly 1,500,000 tons of ammonium sulphate, which is sold in Germany on a basis of between \$25 and \$30 per ton, equal to about one-half of the price for ammonium sulphate in America. The conditions in Germany are, of course, unusual, but rapid advancements are being made in the Haber process, and there is every reason to believe that if plant No. 1 is operated that it will have at least a stabilizing effect upon the fertilizer market and, since the supply will be greatly increased, will tend to decrease the market price of nitrogenous fertilizer.

The company will also undertake to operate certain of the carbide furnaces for the production of phosphoric acid and potash if it is found that it can be done profitably by electrothermic methods.

In closing I think I should add, to forestall unnecessary comment, that while I have assurance of financial support which will enable the company to meet its obligations as they may mature, this offer is made without the knowledge or connivance and without expectation of connection with any of the parties who have so far been mentioned before the Military Affairs Committee as interested in the Muscle Shoals situation. Those to whom I refer are acting from no standpoint of assistance or antagonism to any offer now before Congress, but simply with the hope of developing an important profitable industry in Alabama and Tennessee if the water power becomes available either through the acceptance of the offer of the Alabama Power Co. or through the Government itself completing Dam No. 2 and offering the power therefrom for sale.

Sincerely yours,

CHARLES L. PARSONS.

MARCH 23, 1922.

Hon. JOHN W. WEEKS,
Secretary of War, Washington, D. C.

SIR: I beg to submit to you, and through you to the constituted authorities for proper action, the following offer, which will become binding upon approval by Congress, if approval is obtained within one year from date:

1. I agree to form a company, to be known as the Southern Nitrate Co., which will organize a corporation to be known as the Southern Nitrate Corporation. Securities of this corporation, after being properly underwritten, will be offered at public subscription. Until the public has had an opportunity of purchasing these securities the company will be controlled by the undersigned. The company, or its successor, will enter into such contracts as may be deemed necessary by the Government for the company to effectuate the following proposal:

(a) The company will purchase the first 100,000 kilowatts of secondary horsepower, developed from the dam or dams to be constructed at Muscle Shoals, at a price of 0.75 mill per kilowatt hour, delivered at the switchboard, for power available for 10 months during any calendar year and a proportionate per month price for such portion of the said 100,000 horsepower as may not be available for the full period.

(b) The company will purchase for the sum of \$600,000 all of the property constituting plant No. 1 (as officially known and designated), including lands, steam and power plants, buildings, material, machinery, fixtures, equipment, apparatus, appurtenances, tools, supplies, rights of way and transmission lines, and the right, license, and privilege to use any and all of the patents, processes, methods, and designs which the Government may legally use in plant No. 1, except such patents and designs acquired from the General Chemical Co., which may not legally be transferred to others; provided, that the Government will first remove, without cost to purchaser from plant No. 1, such apparatus connected with the process of the General Chemical Co. for the fixation of nitrogen as was designed by the engineers or employees of the General Chemical Co. and which may not be legally or rightfully used under the Government's structural relations with that company.

(c) As a condition of the above purchases, the company requires—

(1) The option to lease the carbide plant, constituting a portion of plant No. 2, with land, transmission lines, rights of way, and other necessities appropriate to its operation now on the premises, including the buildings, material, machinery, fixtures, equipment, appurtenances, housing facilities, tools, and supplies, together with the liquid air plant and its lands, buildings, and appurtenances, for the sum of \$50,000 per annum.

(2) An option to purchase all of the property constituting the Waco quarry, including rights of way, buildings, material, quarry tracks, machinery, railroad tracks, appurtenances, tools, and supplies for \$200,000 or to lease in lieu of purchase for \$20,000 per annum.

2. If the above offer is accepted by the Government, the company will agree to operate plant No. 1 as an air nitrogen fixation plant and to utilize such portion of the power as is appropriate and can be profitably employed for the electrolysis of water for the production of hydrogen—the basic and most costly raw material of the synthetic ammonia process—any oxygen to be utilized as rapidly as is commercially feasible. The company agrees to operate the carbide plant either for the manufacture of calcium carbide and/or, so far as commercially profitable, for the production of phosphoric acid and potash by electrothermal methods. The company will maintain a research laboratory to develop, if possible, cheaper and more economical methods of procedure for the fixation of nitrogen and for the production of electric furnace products. The company will also agree to keep such portion of plant No. 2 as it may lease in good condition and available to the Government at once in any emergency.

3. The company will agree, in case the Government leases the cyanamid, ammonia oxidation, or the ammonia nitrate plant connected with nitrate plant No. 2, to furnish to any lessee the Government may nominate the calcium carbide it may require for the production of cyanamid or fertilizer products therefrom at a profit of 6 per cent. It also will agree to furnish at cost to such lessee for the purpose of producing cyanamid such power and such pure nitrogen gas as may be necessary to efficient operation.

Trusting that the above offer may meet your approval and the approval of Congress, I am,

Sincerely yours,

CHARLES L. PARSONS.

Senator NORBECK. Your offer includes those residences as well as other property on the ground?

Doctor PARSONS. Yes, sir.

Senator NORBECK. There are 85 of those residences on the ground.

Doctor PARSONS. \$600,000 is the price given by General Williams.

Senator KENDRICK. That does not include the steam plant.

The CHAIRMAN. Oh, yes.

Senator KENDRICK. The big steam plant.

The CHAIRMAN. Oh, no; the little one.

Doctor PARSONS. The one at plant No. 1.

The CHAIRMAN. It includes everything at plant No. 1?

Doctor PARSONS. At No. 1; yes.

The CHAIRMAN. And nothing else?

Doctor PARSONS. Yes; and nothing else.

I don't see that that offer requires any action on the part of this committee unless you should be in position to accept the Alabama Power Co.'s offer or complete the work yourselves. At the same time I thought it proper to explain with reference to it, and I have tried to put everything clearly before you, so that there would be no question.

The CHAIRMAN. There is one thing that arises in my mind. You get 100,000 secondary power, but there is just a little difference of opinion among the experts as to whether some of what is considered primary power might not technically be secondary power. For instance, they say we get 87,300 horsepower that they call primary power at Dam No. 2, but, as a matter of fact, could not some of that be technically called secondary power, because it is only 97 per cent of the time that there would be 87,300 horsepower available.

Major BURNS. You would have 87,300 horsepower available 99½ per cent of the time.

Doctor PARSONS. That is primary power. In most years you would have it more than that.

The CHAIRMAN. Yes; most years more than that. But to be real technical, now, that is not really primary power, is it?

Doctor PARSONS. It is not always an easy matter to separate exactly between primary and secondary power where you have a fluctuating flow, but contracts have been drawn between water power companies covering that question, and could be drawn so that it is understood by all parties and would be administered equitably.

The CHAIRMAN. What would be your understanding, Doctor, as to the amount of primary power?

Doctor PARSONS. Down there?

The CHAIRMAN. Yes.

Doctor PARSONS. Exactly as given you by Major Burns. He is better prepared to speak than I am.

The CHAIRMAN. You would count 87,300 horsepower as primary power?

Doctor PARSONS. Yes, sir.

The CHAIRMAN. Even though it is available only 99½ per cent of the time?

Doctor PARSONS. Yes, sir.

The CHAIRMAN. What about these patents? Are we going to get into trouble, and would we be in trouble about the patents on the Haber process?

Doctor PARSONS. No, sir, I think not. I can not see but what the patent situation, so far as the Haber process is concerned, is practically free. The Haber patents were all taken over by the Alien Property Custodian and belong to the Chemical Foundation and are available to any American company on the same terms with any other American company. That, I think, is definitely determined, and it is generally known. The specific patent of the General Chemical Co. to operate under 100 atmospheres could not be used without reference to the General Chemical Co., but it makes very little difference whether you operate at 99 or 101 atmospheres.

The CHAIRMAN. Well, in the construction of plant No. 1 where all of those concerns had new developments and found out what their mistakes were, did that result in any patents being issued for the improvements that were brought about by the joint action of the Government and the company?

Doctor PARSONS. I know of no patents that would stand in the way of the operation of that plant. However, I am one of those that believe very strongly that the United States Government and the people of the United States do not wish, and can not afford to treat any of their contracts, when they are issued in good faith, as "scraps of paper," contracts that are morally binding, even though there may be certain legal technicalities. Therefore, I believe that any arrangement we made with the General Chemical Co. about the use of their patent should be strictly held to, and that is why I put in my offer that any apparatus built by them should be removed from the premises and not considered a part of the purchase. We have not asked for the privilege of the use of any of their patent rights.

The CHAIRMAN. Well, you did not understand me; probably I did not make myself clear; but, as I understand it, in the construction of this plant there was some kind of a contract between the Government and those who were constructing it about the improvements that should be made in the meantime by the cooperation of the Government experts and their experts. Now, as I understand it—and I may be wrong about it—that cooperation did result in several improvements.

Doctor PARSONS. Yes.

The CHAIRMAN. Were those improvements patented?

Doctor PARSONS. Not so far as I am aware. They were almost solely improvements in mechanical strength, in making their pressure cylinder heads stronger, so that they would not bulge; in fixing up various places where there were leaks; but more especially the improvement has been made in the catalyst. That is the substance which is essential for the combination of nitrogen and hydrogen to form ammonia. Now, the catalyst which the General Electric Co. uses to-day is entirely different from the catalyst which was used in plant No. 1 at Muscle Shoals. That catalyst did not function because they could not make it on a large scale as they did in the laboratory. They now have a secret catalyst. The Nitrogen Fixation Laboratory also has developed a catalyst in the last year, which is superior, in my opinion, to any other catalyst in the world.

The CHAIRMAN. That is a Government laboratory?

Doctor PARSONS. The Government laboratory, and that would be available to any plant which might be added in plant No. 1. That was discovered by Government employees.

Senator NORBECK. The information I got from one of the engineers was that the failure of the Haber process at Muscle Shoals was due to the fact that they attempted to carry 1,500 pounds of pressure in steel pipes at the same time that they carried a temperature of 1,500 centigrade.

Doctor PARSONS. No; that was around 500°, Senator.

Senator NORBECK. Oh, 1,500 Fahrenheit?

Doctor PARSONS. No; it is 1,500 pounds pressure per square inch and about 500° centigrade.

Senator NORBECK. And they were not able to get pipes that would carry that pressure, with that heat?

Doctor PARSONS. That was one of the difficulties that arose.

Senator NORBECK. Can that particular thing be removed?

Doctor PARSONS. Oh, yes. It has been in all of the plants operating in the world, because they are all working under similar or more difficult conditions.

Senator NORBECK. By the manufacture of pipe that will stand pressure at high heat?

Doctor PARSONS. No.

Senator NORBECK. No such pipe was available at the time of this construction?

Doctor PARSONS. Yes; but they have had to find out these things by trial.

Senator NORBECK. That is practically the same experience that the German people had in building their plant?

Doctor PARSONS. Exactly, and that was the experience at Muscle Shoals in plant No. 1 which had to be closed down at the time of the armistice.

Senator NORBECK. It is your idea that if our people could have kept on for another year, they would have operated that Haber plant successfully at Muscle Shoals?

Doctor PARSONS. That is not only my idea, but that is the idea of everybody that had any connection with the plant.

Senator NORBECK. And in your opinion that would have resulted in a much cheaper output than would have been produced at the other plant?

Doctor PARSONS. Unquestionably.

Senator HEFLIN. What do you think it would cost to put the Haber plant in operating condition at plant No. 1?

Doctor PARSONS. I think, with the material already there at plant No. 1, to bring it up to a 30-ton-per-day capacity—which is the capacity originally estimated—it would cost in the neighborhood of \$2,000,000. I am lower in that figure than are some of the Ordnance people. They may be nearer right than I am, but I have a pretty good basis for my calculations, because I know something about costs in other plants.

Senator HEFLIN. You think, then, that with the expenditure of \$2,000,000 it could be made a perfectly good plant?

Doctor PARSONS. It could be made a perfectly good plant to that extent; yes, sir.

The CHAIRMAN. Then, what would its capacity be?

Doctor PARSONS. Thirty tons of ammonia per day. I am merely talking about the plant itself. There may be other accessories that will have to be put in which will cost more, as was the condition when the original plants were put in down there. Of course, the so-called cost of plant No. 1 was originally estimated at about \$7,000,000,

and it really cost \$13,000,000, but the \$13,000,000 included many things not estimated for in the first estimate, like the ammonium nitrate plant, the oxidation plant, the plant for the concentration of nitric acid, and other things.

Senator NORBECK. And those 85 residences.

Doctor PARSONS. Yes, sir; the residences and the water works and railroad tracks. I am not prepared to say that I should not like to have more than \$2,000,000 available if I were going to undertake the work, but I believe the plan can be carried out and the plant put in operation for that amount.

The CHAIRMAN. Were you there during the construction of plant No. 1?

Doctor PARSONS. Yes, sir. Yes and no. I was there during the whole latter part of the construction of plant No. 1.

The CHAIRMAN. Were you located there?

Doctor PARSONS. Oh, no, I was not located there. I beg your pardon.

The CHAIRMAN. What portion of your time did you spend there? Were you actually engaged in the construction?

Doctor PARSONS. I was not, in any sense at all.

The CHAIRMAN. What was your purpose in going down there?

Doctor PARSONS. I went there as a member of the Nitrates Commission.

Senator NORBECK. If that plant is remodeled at a cost of approximately a couple of million dollars, as you suggest, you are satisfied that, in all probability, it will operate successfully?

Doctor PARSONS. Yes.

Senator NORBECK. In that event, how much cheaper will they produce than will the cyanamide plant which is there?

Doctor PARSONS. I should have to have a number of basic facts to go on to answer that question.

Senator NORBECK. Would you be willing to look that up?

Doctor PARSONS. I can answer your question here, if you will get down to the points, so that it will be correctly answered when I have answered it.

Senator NORBECK. Yes.

Doctor PARSONS. Do you assume that you will use the secondary power to produce your hydrogen, or do you calculate that you are going to use your steam power to produce your hydrogen?

Senator NORBECK. Let us assume that the horsepower cost three-fourths of a mill on the cyanamide process. How much cheaper, if any, do you think you could produce under the Haber process, with the present steam plant, after you have remodeled it, as you suggest?

Doctor PARSONS. I think you could produce ammonia for from 75 to 80 per cent of the price that you could hope to produce it with the cyanamide process.

Senator NORBECK. Even with that very cheap power?

Doctor PARSONS. Yes; even with that very cheap power, from 75 to 80 per cent, and perhaps less. The Ordnance Department and the Nitrogen Fixation Laboratory have estimated that they can produce ammonium sulphate at plant No. 2 on the basis of about \$65 per ton—that is, under commercial conditions—\$65 per ton of ammonium sulphate. Now, I do not think they can; in fact I feel absolutely certain that they can not.

Senator NORBECK. You think it would cost how much?

Doctor PARSONS. At least \$75 and perhaps \$80.

Senator NORBECK. And you think, with the Haber process and with the secondary power, you might produce it at how much?

Doctor PARSONS. Around \$50 a ton. That is, if you operate it by a commercial concern.

Senator NORBECK. May I ask you this question, Doctor? Out of this \$50 or \$60 a ton what part of the expense would be power?

Doctor PARSONS. Again, you must take into consideration whether you are going to use power to produce your hydrogen or coal to produce your hydrogen?

Senator NORBECK. I mean after you have remodeled it at an expense of a couple million dollars, as you said awhile ago.

Doctor PARSONS. If you are going to produce power to produce hydrogen—

Senator NORBECK. Is that what you have implied when you say you would remodel your plant by spending a couple million dollars on it?

Doctor PARSONS. That is the method I should use down there, yes. I am afraid I will have to put that in the record, to be accurate.

Do you know what it is, Major [addressing Major Burns]?

Major BURNS. According to that scheme you would use about 4,000 kilowatts per ton of ammonium sulphate. On the basis of a mill per kilowatt hour, your power cost would be \$4 per ton of ammonium sulphate. On the basis of 4-mill power it would be \$16 per ton.

Doctor PARSONS. I am talking about mill power only.

Major BURNS. Assuming it at \$50 a ton, your power charge would be \$4 and your percentage would be 8 per cent, or 4 divided by 50. That is in round figures.

Doctor PARSONS. You are considering making the hydrogen electrolytically.

Major BURNS. That is what I understood you to say.

Doctor PARSONS. I do not have those figures in my mind. I have had them all calculated out, and I can give them to you exactly.

Senator NORBECK. We are trying to find out how much it will help toward the cheapening of fertilizer.

Doctor PARSONS. The only power at Muscle Shoals that will do any good is that secondary power.

The CHAIRMAN. You would have to do that with the Haber process.

Doctor PARSONS. You would have to do it with the Haber process. In my opinion you can not use secondary power or any other power, even if your power cost you nothing, to run the cyanamid plant and make fertilizer at any cheaper rate than it is to-day. I think you ought to examine quite carefully the various records bearing upon that matter. I think you ought to get the so-called Exhibit B that was introduced in the House hearings, put in by the Ordnance Department, in which they made their estimate of the operation of the cyanamid plant, showing, at the request of Mr. Fields, what the outcome would be in operating that plant for six years.

They estimated that if we should operate that plant for six years, we would lose \$2,919,000, and in order to get that loss they have taken the ammonium sulphate at \$65 a ton. That price for ammonium sulphate is not "cheap fertilizer." Ammonium sulphate in 1921 sold for an average of less than \$50 a ton. It sold for \$40 a ton, and there was a lot of it that was sold in the low thirties. If you take \$50 a ton as the price of ammonium sulphate in plant No. 2, according to the estimate of the Ordnance Department—and, in my opinion, those estimates are low—you would lose in those six years over \$22,000,000 by operating the plant. That is on the basis of secondary power.

Senator NORBECK. And you would not be furnishing cheap fertilizer.

Doctor PARSONS. That is on the basis of \$50 a ton for ammonium sulphate.

Senator NORBECK. That is not a cheap fertilizer?

Doctor PARSONS. It is more than the average price for the last year.

The CHAIRMAN. Now, to get down to a practical solution of that difficulty, it would be your judgment, as I understand it, that plant No. 2 is useful and should be considered and kept as a war proposition, and that the other plant, under the method you have described, should be operated by secondary power. Is that about right?

Doctor PARSONS. That is right; yes, sir.

The CHAIRMAN. If the Government, for instance, retains it?

Doctor PARSONS. But basic to all of that, I want to go very strongly on record by saying that no matter what you would do at that plant, through that power, you are not going to get "cheap fertilizer" for anybody.

Senator HEFLIN. Mr. Ford says he can make cheap fertilizer if we give him that power under the arrangement that he has suggested to the Government.

Doctor PARSONS. It is important, I think, that you should all read very carefully both the House records and the Senate records. Mr. Mayo is unquestionably a most excellent engineer and understands water power and engineering propositions, but he has shown throughout his testimony that they have had nobody that was familiar with fertilizer production advising them at all. His testimony is decidedly varied as given before the House committee and this committee. It has been distinctly changed. In the House committee he stated several times that they would not operate plant No. 2 at all, unless they could operate it at a profit. That is shown to be Ford's statement and the belief also of practically everyone who has studied the situation among the higher officials. For example, Secretary Weeks shows very clearly in his testimony that he does not consider that this offer carries any real assurance in any way that any fertilizer or nitrate will be made.

General Williams says:

"If the Ford offer means, in the case of the No. 2 plant, that such plant will be operated at its approximate capacity for the fixation of nitrogen," etc.

General Beach says:

"Direct benefits accruing to the United States are (b) production in the interest of public welfare of large amounts of fertilizer at a cost not exceeding the reasonable cost of production, providing that the production of nitrates adapted to fertilizer purposes is found to be practicable."

The Secretary of Agriculture in his statement to you was no less noncommittal. The authorized statement given out by Director Tolman favors the Ford offer only "if its terms are sufficiently definite and binding to make sure that the plant will be operated continuously for the manufacture of fertilizer."

Mr. Ford, according to Secretary Weeks, states definitely that plant No. 2 will not be operated unless it can be operated at a profit, and Mr. Mayo definitely confirms this statement in his testimony before the House committee.

Now, as to the question of price, I specially had copied from the record the following, if I may put it in to show where that question of the "one-half price" arose, and to bring out another point which Mr. Mayo, I think, did not bring out in his testimony here, namely, that before the House committee he said that the offer meant they would make 2,000,000 tons of fertilizer. Here he simply spoke of 110,000 tons of ammonium nitrate, and there is a very great difference between the two.

Senator HEFLIN. He testified here that it was Mr. Ford's intention to manufacture fertilizers on a large scale.

Doctor PARSONS. The difficulty in the whole situation is the question of Mr. Ford's intention, but the thing that you want is Mr. Ford's guaranty. I am sorry that Mr. Ford has not himself come here and put himself on record.

Senator HEFLIN. He has modified his proposal somewhat, you know, and states that he agrees to make commercial fertilizers.

Doctor PARSONS. As to the commercial fertilizers, I will bring that out. May I read you this paragraph?

The CHAIRMAN. Yes.

Doctor PARSONS. It is as follows:

"Mr. GARRETT. You stated in answer to a question by some gentleman here this morning that you thought he could make fertilizer 50 per cent cheaper than it is to-day.

"Mr. MAYO. We think so; yes, sir.

"Mr. GARRETT. On what do you base that statement?

"Mr. MAYO. Well, we base that on a number of processes, any one of which we may adopt."

And all through his testimony it has been "any number of processes." They apparently have not any expert advice on the nitrogen situation whatsoever.

Senator. HEFLIN. He claims they have a secret process.

Doctor. PARSONS. Yes; he talks about that, and he also says that they have a process of making fertilizer as an adjunct to electric steel and aluminum. That process has been well known for fifteen or twenty years, and if he did not have any process three months ago, I do not think, as he has no nitrogen experts with him, that in three months he has developed anything very wonderful or has brought it out in a way that would give you any basis for accepting it.

Senator. HEFLIN. But, of course, you do not know whether he has or not.

Doctor PARSONS. No; nobody knows anything about it at all; but we do know that the lime slag iron obtained from iron ore which contains phosphate takes the phosphorus out of the iron ore, and this so-called Thomas slag has been used for fertilizer purposes in Europe and in America for a long time. We also know in connection with the manufacture of aluminum, that there has been a process originally devised by Serpek in France, and worked in this country by the Aluminum Co. of America, and which has been abandoned by both after the expenditure of hundreds and hundreds of thousands of dollars, it having been found to be entirely impractical. In my opinion it will always be impractical, on account of the very high heat that has to be used, and various other conditions.

I will go ahead with this testimony now, if I may:

"Mr. GARRETT. You mean that you have in mind processes for the manufacture of fertilizer that have not yet been developed by any of the other companies?

"Mr. MAYO. Yes sir; or partly developed by some of them.

"Mr. GARRETT. What I want to get at is this: Regardless of that, because that is something we do not know about now, but we do know that fertilizer is being made, and how it is being made, and how it is being distributed now.

"Mr. MAYO. Yes, sir.

"Mr. GARRETT. And what I want to get in the record is how much cheaper can Mr. Ford, in your opinion, make fertilizer at this plant if the Government accepts his offer, at the rate of about 2,000,000 tons per year than it is being made generally throughout the country?"

Mr. Mayo at those other hearings testified that 2,000,000 tons of fertilizer was the equivalent of 110,000 tons of ammonium nitrate, simply because the 2,000,000 tons does contain the same amount of nitrogen as the 110,000 tons, forgetting that if you made all of those things by the electrothermal method you would be using more power than Muscle Shoals would supply.

"Mr. MAYO. Of course, we are green at the fertilizer business, and I could not exactly say, but Mr. Washburn in his statement said he thought it could be made there at about one-half the price."

There is the original basic thought upon which all of this one-half price has been based. Mr. Washburn, in his original talk before the House committee, before the war, when he was trying to get Muscle Shoals developed, thought that he could make fertilizer down there for one-half price, and Mr. Mayo simply adopted that statement, and, in my opinion, he has nothing else whatever to go on, for, as I have said before, if you take 2,000,000 tons of fertilizer, and put in it the total amount of nitrogen that is present for nothing, it would not reduce it 33½ per cent.

"Mr. GARRETT. Do you think you would be safe in saying to the committee, as the spokesman of Mr. Ford, that it would be made 33½ per cent cheaper than it is being made and distributed to the farmer now?"

"Mr. MAYO. Yes, sir."

Now, if you could get him to guarantee that 2,000,000 tons of fertilizer a year and a 33½ per cent reduction in price, I am for the Ford offer.

Senator KEYES. In your opinion could that plant No. 2, under this proposal or any other proposal made to this committee, be operated so as to materially reduce the price of fertilizer to the farmers of this country?

Doctor PARSONS. No, sir; I do not.

Senator HEFLIN. Then, you do not think there is any hope for fertilizer users in this country; that it must remain in the hands of the fertilizer trust?

Doctor PARSONS. I do not think there is any fertilizer trust, Senator.

Senator HEFLIN. Don't you?

Doctor PARSONS. I have seen in the last few years the strictest competition between them. I think if you will look into their profits that the stock has been down to almost nothing in all cases, and they have been paying no dividends. As to there being any "trust," I think it is just as much a shibboleth as the question of this "cheap fertilizer." I do not own any fertilizer stock, nor am I interested, directly or indirectly, in any fertilizer company, but I believe that is absolutely true. Now, the more fixed nitrogen you can produce and the more you develop methods for production, the more you decrease the price of fixed nitrogen to the farmer in his fertilizer. I am thoroughly desirous of seeing that accomplished, and I believe it is going to be accomplished, but it is not going to be accomplished through Muscle Shoals or any other power proposition.

Senator HEFLIN. Why, then, do you suppose these commercial fertilizer concerns are fighting the Ford offer, unless they are afraid that he will reduce the price of fertilizer?

Doctor PARSONS. If they think that a man is going to have an immense business given to him on a gold platter with a bonus, they naturally hesitate to have the supply of the country increased by 25 per cent under those conditions, to compete with them immediately, because it would probably be a very serious thing. At least, that is the way it seems to me. Now, when you give that immense power to a person simply on the basis of cheap fertilizer, you are giving one of the biggest subsidies ever given in American history to any one man. I do not care whether it is Mr. Ford or anyone else. Mr. Ford, of course, is a dreamer of dreams, one of which has come true, and Mr. Mayo said that this cheap fertilizer was one of his dreams. In that connection Mr. Mayo has said:

"It is Mr. Ford's dream in regard to this fertilizer product to make the price of it such that anybody can use it in any quantity they wish to; that the expense would not prevent them from using all they should use."

That is a beautiful dream and I hope it will come true, but I maintain it is not coming true through Muscle Shoals.

Senator HEFLIN. You know, some of them claim that they will use 500,000 horsepower in that river at those three dams. What do you think of that?

Doctor PARSONS. Five hundred thousand horsepower?

Senator HEFLIN. Yes.

Senator KEYES. For what purpose?

Senator HEFLIN. For any purpose.

Doctor PARSONS. When they get those dams going—and do not misunderstand me; I am not against the building of those dams to get the power for industrial use, I am for it; but I do not want to see it developed under a false premise. You need those industries in Alabama, you need those industries in Tennessee, and you need those industries in my own home State of Georgia. You need that power for the development of our industries. There is only one great fault, you must remember, and that is that the people down there have the idea that this will bring in thousands of people, as they thought would be the case at Niagara Falls. The actual facts are that when they developed Niagara Falls, taking into consideration the textile industry at Lawrence, they thought they were going to get a city of 3,000,000 inhabitants, and they did not get more than 15,000. Down there, you will not get any more, because it will not require that many people to run it. Electrochemical industries do not mean

people. I want to see the dam completed and the power used all through the South, the same as around New York and other places.

Senator HEFLIN. You do not want to see Mr. Ford's offer accepted, do you?

Doctor PARSONS. I do not believe any such asset as that immense power should be given as a bonus to any American citizen. You should either sell it properly or you should develop it yourselves.

Senator HEFLIN. Well, if he should be able to manufacture cheap fertilizer, it would be a great service to millions of farmers, would it not, if the Government let him have it?

Doctor PARSONS. I think the getting of cheap fertilizer would be a great service to the American farmers; yes, sir; but it is not coming that way.

Senator KENDRICK. I would like to ask you a question right there, Doctor PARSONS. Is it your opinion, based on statements you have made, that the Government owning and controlling power and leasing such of it as there may be found a market for, particularly the primary power, and proceeding in its own way to keep one of those plants operating for the production of nitrogen, would be just as apt, even more apt, to reduce the cost involved in the production of nitrates as any private individual or corporation?

Doctor PARSONS. No, Senator; I am not in favor of Government operation of any commercial organization of this kind. If you go into the production of nitrates by the Government it means that you will have to take up the whole fertilizer business, and it means—

Senator KENDRICK. I want to interrupt you there to say that the primary purpose of the whole scheme has been, or that is, it was in its initiation, to provide nitrates for the use of the Government in war time.

Doctor PARSONS. Quite right.

Senator KENDRICK. Now, in order to have an effective and efficient plant for the production of nitrates when war comes, this plant or some other plant must be kept in operation.

Doctor PARSONS. I agree with you very heartily.

Senator KENDRICK. So it would not be entirely a commercial proposition.

Doctor PARSONS. What I personally believe in is that plant No. 2 should be kept in a stand-by condition at a cost of something like \$100,000 a year. It can be ready to operate at a moment's notice, until such time as we have other reserves, so that there will be no need for keeping it. I am of the opinion that the fixation of nitrogen will be developed most rapidly and most efficiently by private competition, and I believe that private competition is in sight. I do not believe that anyone has a monopoly of the fixation of nitrogen in this country, and that it is quite possible, and in fact practically certain, that there will be strong competition in the development of synthetic ammonia processes. The future fixation of nitrogen is going to be through the synthetic processes, although, of course, no one is prepared to state that some wonderful discovery may not be made to-morrow. I do not wish to intimate that we have improved as much as we will ultimately improve it, or to be through, but the use of the synthetic processes is the present outlook. Now, personally, I believe you would get furthest by carrying out exactly the plan I have put in my offer there, that plant No. 1 should be sold, we will say, to the highest bidder, and that the secondary power to operate that plant be in some way furnished.

Senator HEFLIN. So it is possible, then, you say, for the discovery any day of a process that will produce the stuff cheaper than it is produced to-day. Now, Mr. Ford says that he has a secret process by which he will be able to make it much more cheaply than it is made to-day.

Doctor PARSONS. There was a lecture given by Mr. Ashton at the Cosmos Club a few days ago in which he stated that the first man who set free the energy which we know to be present in the atom might, by that very act, set free the energy of all of the atoms and thereby blow the earth into a nebula. I think there is as much probability in one as in the other. I am willing to say that both of them are possible.

Senator HEFLIN. You think it is possible for somebody to discover something to-morrow that will be a much cheaper process than that which you have to-day, yet you think it is impossible for Mr. Ford to get hold of one of those processes.

Doctor PARSONS. I did not say that I thought it was impossible. I said it was just as probable he had developed this wonderful secret process in two months as the other of those two things which I mentioned. I am not denying the possibility of anything. Senator.

The CHAIRMAN. Now, Doctor PARSONS, I want to get back to where I started out with you when somebody else took you away from me. At that time I had not gotten out what I wanted to get out. You were talking about operating plant No. 1 on

secondary power. Will the secondary power that will be made, say, for 10 months in the year, be more than enough to operate plant No. 1 under your plan?

Doctor PARSONS. That depends entirely on the extent to which plant No. 1 is enlarged. It would be much more—

The CHAIRMAN. I am speaking of it as it stands now.

Doctor PARSONS. It would be much more than enough to operate it as it stands. The actual fact is that with 100,000 secondary power available 10 months of the year, it will give just about the output that No. 2 would give, provided there was the necessary installation at No. 1 to utilize that power for the electrolysis of water.

The CHAIRMAN. Then, it would mean this, that there would be secondary power enough developed at Dam No. 2 to operate the Haber process planned under your plan, with an annual capacity of 40,000 tons of nitrogen?

Doctor PARSONS. You have it absolutely right, Senator. It would be slightly in excess of that.

The CHAIRMAN. That would mean as much as a war proposition as nitrate plant No. 2 could do running to its full capacity, regardless of expense?

Doctor PARSONS. It would mean very much more as a war proposition, simply because you would have an operating plant, a modern commercial plant, and you would have to keep that up to date all the time.

The CHAIRMAN. To do that, how much would you have to increase the capacity of plant No. 1?

Doctor PARSONS. Five times.

The CHAIRMAN. Five times; and how much money would it cost?

Doctor PARSONS. Government built or privately built?

The CHAIRMAN. Well, both ways. Give it to us both ways.

Doctor PARSONS. Well, I should want around \$15,000,000 to \$20,000,000.

Senator NORBECK. For which way?

Doctor PARSONS. Am I going to do it?

Senator NORBECK. Give it to us the private way and the ordinary Government way, so that we can have the comparison. It would be \$30,000,000 Government built, then, would it?

Doctor PARSONS. I do not think I had better make that comparison, Senator. I think that, efficiently done, \$15,000,000 to \$20,000,000 would cover the situation. That is the best way for me to put it.

Senator NORBECK. The chairman and I do not agree on the degree of Government efficiency.

The CHAIRMAN. I want to have it in the most efficient way.

Doctor PARSONS. I think \$20,000,000 would be sufficient.

The CHAIRMAN. Well, you are speaking now of letting it by contract to some private individual, and if you mean that is the efficient way, that is the way I want you to make your estimate.

Doctor PARSONS. No; I would not let it by contract.

The CHAIRMAN. Well, the cheapest way that you could do it and have it good.

Doctor PARSONS. Well, say \$15,000,000.

The CHAIRMAN. All right.

Doctor PARSONS. I would like to have the privilege of placing that figure in the record.

The CHAIRMAN. All right, if you care to. I would like to know the figure.

Doctor PARSONS. But I think that is essentially correct.

The CHAIRMAN. When we reach that point—

Doctor PARSONS. Major Burns said he would put it at \$20,000,000.

The CHAIRMAN. How many years would it take to have that done? It would not take more than a year or two, would it?

Doctor PARSONS. Oh, yes, sir. Nobody ought to go at a matter of that kind at once. It would not be a proper procedure. You ought to build your first 10-ton unit and operate it for six months and then increase to your 30 and operate that for a year and a half, and then go ahead and put in your full construction. Remember, you can not do anything with this until you get your secondary power.

The CHAIRMAN. I am asking you to outline it. It would take three or four years before you would be consuming your secondary power?

Doctor PARSONS. Yes, sir.

The CHAIRMAN. To its maximum, at that one dam. Now, in the meantime, you would have a lot of secondary power to sell if you could find a market for it, under your plan?

Doctor PARSONS. There is very little market for secondary power there.

The CHAIRMAN. That is true, unless it is something that it is peculiarly situated, so that the people need the power.

Now, Doctor, I wish you would—

Mr. Chairman, there is just one question I would like to ask at subject.

Go ahead, Senator.

ask a question in connection with your statement that the plants should be kept in stand-by condition until the emergency arises as if they were kept in operation?

plant in that way, Senator Kendrick, materials which do not readily deteriorate; copper and copper wire, copper leads, which are made of fire brick.

the air or that goes to pieces.

long time, especially that operating. It is quite possible

more difficult to keep in shape,

because it is quite largely enameled iron, brick and mortar. The ammonium

has been superseded, and I do not think will

the cyanamid plant is concerned, the portion of the plant could with very slight expense be kept in

number of years.

state something in your testimony about \$100,000 being

or less, I think, is the actual experience of the Ordnance

year or two.

or, let us go back again to where I was. You said something provided for, and I suppose you were referring to the bill that I have

s. Yes, sir.

AN. It was not my idea, Doctor, in providing that the salaries should

,500 annually, that we should employ chemists, or anything of that kind.

idea, if that method were adopted, that the board ought to consist of men of

who are especially educated in scientific lines?

or PARSONS. I think that on a board of three men, as you have it there, there should be at least one of them who is thoroughly technically educated along these lines, and that the others should be business men of vision and of successful experience. I do not believe you can get any such men, either the technical men or the business men, who would give up their time to a proposition of that kind for less than three or four times the salary per individual that you have provided for there. I know that any industrial corporation in a proposition of this kind would pick the best men that they could find in the country, and in order to get them, would pay those salaries, and I know that the best man is the cheapest, irrespective of what you pay him.

The CHAIRMAN. You may be entirely right about that, Doctor, and I do not want to criticize your position at all, because I think your position is the one that probably would be sustained by most people; but my idea was that on the board who would operate this proposition you would not necessarily have chemists or engineers. In fact, if I were selecting those men, I do not believe that I would select any one of them because of the fact that he was a chemist or an engineer, but I would select, rather, broad-minded business men, and they would employ such chemists and such engineers as they needed. For instance, if I were selecting them and I could get a man like Mr. Ford, I think I would pick him as one of the men to handle this great concern, although he is neither an engineer nor a chemist, and I believe that I would be competent myself to handle that thing, although I am only getting \$7,500 a year, and I can not save nearly as much out of that salary as I could if I were handling that job.

Doctor PARSONS. I know, for I worked for the United States Government eight years of my life. You are doing it the same as I did, solely for the personal satisfaction of accomplishment.

The CHAIRMAN. Yes, sir; yes, sir.

Doctor PARSONS. Nothing else.

The CHAIRMAN. Now, could you not get those men and give them this life job?

Doctor PARSONS. No; that is a commercial business.

Senator NORBECK. The marble halls are missing; is that it?

Doctor PARSONS. Government service has both its advantages and disadvantages. It seems to me sometimes as if the men who were doing the best work in some of the departments are the ones who are blamed and received the most criticism.

preliminary to the installation of nitrogen-fixation plants in this country, and, later, throughout the war, as a member of the nitrate commission in frequent consultation with Secretary Baker, Assistant Secretary Crowell, and the officers of the Ordnance Department, especially those of the nitrate division. I have since made three trips to Europe and have kept in constant touch with the advancements in nitrogen fixation and with the individual engineers, chemists, and chief executives of many of the fixed-nitrogen plants abroad as well as in this country. I have the necessary experience and knowledge of new methods to direct the design and installation of a synthetic-ammonia process at plant No. 1 which will operate commercially. The patent situation offers no difficulties.

I have constantly advised that the cyanamid process was becoming obsolete while the synthetic-ammonia processes—variously designated under the names of Haber process, the Claude process, and the General Chemical process—were rapidly becoming the sole commercial procedure for the fixation of nitrogen for fertilizer and explosive use. The practical obsolescence of the cyanamid plants throughout the world, as detailed in my recent testimony before the Military Affairs Committee on March 13, is in entire accord with my prediction. The remarkable success of the General Chemical Co.'s synthetic-ammonia process in its second installation at Syracuse entirely justifies its first trial installation at plant No. 1 at Muscle Shoals. The fact that a plant to produce 100 tons of fixed nitrogen per day is on the way to completion, using a similar process, at Billingham, England; the fact that an immense cyanamid plant at Odda, Norway, nearly one-half the size of the cyanamid plant at Muscle Shoals, was sold on February 11 for 50,000 kroner, approximately \$10,000 present exchange or \$16,000 at normal exchange; the fact that this Norwegian plant is planning to convert its water power to exactly the same use I suggest in the accompanying offer, using a synthetic-ammonia process; and the fact that installations of similar synthetic processes are under way in France, Italy, and Japan, is proof of the correctness of the stand I have always taken.

In order that the accompanying offer may not exclude anyone who may differ from me as to the possibility of operating commercially for cyanamid at plant No. 2, provisions are made so that this plant may be operated by others if the Government so elects and can find lessees therefor.

This offer is made with the intent of developing at Muscle Shoals an industry for the fixation of nitrogen which has possibilities of a greater output of fixed nitrogen than can be produced at plant No. 2. It contemplates the production of calcium carbide and of acetylene therefrom for use in autogenous welding. These products will be made especially with a view to the utilization of a part of the oxygen gas produced, otherwise as a waste product, in the electrolytic production of hydrogen. In view of the extended discussion in the public press of philanthropic fertilizer production, I wish to state frankly it is intended to operate these plants for business purposes, with the expectation of a fair business profit.

If the offer is accepted and the water power is allocated to the company which I will form, plant No. 1 will be converted into a plant for the fixation of nitrogen by the Haber process or a modification thereof. This process is turning out to-day in Germany 300,000 tons per annum of fixed nitrogen, equivalent to nearly 1,500,000 tons of ammonium sulphate, which is sold in Germany on a basis of between \$25 and \$30 per ton, equal to about one-half of the price for ammonium sulphate in America. The conditions in Germany are, of course, unusual, but rapid advancements are being made in the Haber process, and there is every reason to believe that if plant No. 1 is operated that it will have at least a stabilizing effect upon the fertilizer market and, since the supply will be greatly increased, will tend to decrease the market price of nitrogenous fertilizer.

The company will also undertake to operate certain of the carbide furnaces for the production of phosphoric acid and potash if it is found that it can be done profitably by electrothermic methods.

In closing I think I should add, to forestall unnecessary comment, that while I have assurance of financial support which will enable the company to meet its obligations as they may mature, this offer is made without the knowledge or connivance and without expectation of connection with any of the parties who have so far been mentioned before the Military Affairs Committee as interested in the Muscle Shoals situation. Those to whom I refer are acting from no standpoint of assistance or antagonism to any offer now before Congress, but simply with the hope of developing an important profitable industry in Alabama and Tennessee if the water power becomes available either through the acceptance of the offer of the Alabama Power Co. or through the Government itself completing Dam No. 2 and offering the power therefrom for sale.

Sincerely yours,

CHARLES L. PARSONS.

MARCH 23, 1922.

HON. JOHN W. WEEKS,
Secretary of War, Washington, D. C.

SIR: I beg to submit to you, and through you to the constituted authorities for proper action, the following offer, which will become binding upon approval by Congress, if approval is obtained within one year from date:

1. I agree to form a company, to be known as the Southern Nitrate Co., which will organize a corporation to be known as the Southern Nitrate Corporation. Securities of this corporation, after being properly underwritten, will be offered at public subscription. Until the public has had an opportunity of purchasing these securities the company will be controlled by the undersigned. The company, or its successor, will enter into such contracts as may be deemed necessary by the Government for the company to effectuate the following proposal:

(a) The company will purchase the first 100,000 kilowatts of secondary horsepower, developed from the dam or dams to be constructed at Muscle Shoals, at a price of 0.75 mill per kilowatt hour, delivered at the switchboard, for power available for 10 months during any calendar year and a proportionate per month price for such portion of the said 100,000 horsepower as may not be available for the full period.

(b) The company will purchase for the sum of \$600,000 all of the property constituting plant No. 1 (as officially known and designated), including lands, steam and power plants, buildings, material, machinery, fixtures, equipment, apparatus, appurtenances, tools, supplies, rights of way and transmission lines, and the right, license, and privilege to use any and all of the patents, processes, methods, and designs which the Government may legally use in plant No. 1, except such patents and designs acquired from the General Chemical Co., which may not legally be transferred to others; provided, that the Government will first remove, without cost to purchaser from plant No. 1, such apparatus connected with the process of the General Chemical Co. for the fixation of nitrogen as was designed by the engineers or employees of the General Chemical Co. and which may not be legally or rightfully used under the Government's contractual relations with that company.

(c) As a condition of the above purchases, the company requires—

(1) The option to lease the carbide plant, constituting a portion of plant No. 2, with land, transmission lines, rights of way, and other necessities appropriate to its operation now on the premises, including the buildings, material, machinery, fixtures, equipment, appurtenances, housing facilities, tools, and supplies, together with the liquid air plant and its lands, buildings, and appurtenances, for the sum of \$50,000 per annum.

(2) An option to purchase all of the property constituting the Waco quarry, including rights of way, buildings, material, quarry tracks, machinery, railroad tracks, appurtenances, tools, and supplies for \$200,000 or to lease in lieu of purchase for \$20,000 per annum.

2. If the above offer is accepted by the Government, the company will agree to operate plant No. 1 as an air nitrogen fixation plant and to utilize such portion of the power as is appropriate and can be profitably employed for the electrolysis of water for the production of hydrogen—the basic and most costly raw material of the synthetic ammonia process—any oxygen to be utilized as rapidly as is commercially feasible. The company agrees to operate the carbide plant either for the manufacture of calcium carbide and/or, so far as commercially profitable, for the production of phosphoric acid and potash by electrothermal methods. The company will maintain a research laboratory to develop, if possible, cheaper and more economical methods of procedure for the fixation of nitrogen and for the production of electric furnace products. The company will also agree to keep such portion of plant No. 2 as it may lease in good condition and available to the Government at once in any emergency.

3. The company will agree, in case the Government leases the cyanamid, ammonia oxidation, or the ammonia nitrate plant connected with nitrate plant No. 2, to furnish to any lessee the Government may nominate the calcium carbide it may require for the production of cyanamid or fertilizer products therefrom at a profit of 6 per cent. It also will agree to furnish at cost to such lessee for the purpose of producing cyanamid such power and such pure nitrogen gas as may be necessary to efficient operation.

Trusting that the above offer may meet your approval and the approval of Congress, I am,

Sincerely yours,

CHARLES L. PARSONS.

Senator NORBECK. Your offer includes those residences as well as other property on the ground?

Doctor PARSONS. Yes, sir.

Senator NORBECK. There are 85 of those residences on the ground.

Doctor PARSONS. \$600,000 is the price given by General Williams.

Senator KENDRICK. That does not include the steam plant.

The CHAIRMAN. Oh, yes.

Senator KENDRICK. The big steam plant.

The CHAIRMAN. Oh, no; the little one.

Doctor PARSONS. The one at plant No. 1.

The CHAIRMAN. It includes everything at plant No. 1?

Doctor PARSONS. At No. 1; yes.

The CHAIRMAN. And nothing else?

Doctor PARSONS. Yes; and nothing else.

I don't see that that offer requires any action on the part of this committee unless you should be in position to accept the Alabama Power Co.'s offer or complete the work yourselves. At the same time I thought it proper to explain with reference to it, and I have tried to put everything clearly before you, so that there would be no question.

The CHAIRMAN. There is one thing that arises in my mind. You get 100,000 secondary power, but there is just a little difference of opinion among the experts as to whether some of what is considered primary power might not technically be secondary power. For instance, they say we get 87,300 horsepower that they call primary power at Dam No. 2, but, as a matter of fact, could not some of that be technically called secondary power, because it is only 97 per cent of the time that there would be 87,300 horsepower available.

Major BURNS. You would have 87,300 horsepower available 99½ per cent of the time.

Doctor PARSONS. That is primary power. In most years you would have it more than that.

The CHAIRMAN. Yes; most years more than that. But to be real technical, now, that is not really primary power, is it?

Doctor PARSONS. It is not always an easy matter to separate exactly between primary and secondary power where you have a fluctuating flow, but contracts have been drawn between water power companies covering that question, and could be drawn so that it is understood by all parties and would be administered equitably.

The CHAIRMAN. What would be your understanding, Doctor, as to the amount of primary power?

Doctor PARSONS. Down there?

The CHAIRMAN. Yes.

Doctor PARSONS. Exactly as given you by Major Burns. He is better prepared to speak than I am.

The CHAIRMAN. You would count 87,300 horsepower as primary power?

Doctor PARSONS. Yes, sir.

The CHAIRMAN. Even though it is available only 99½ per cent of the time?

Doctor PARSONS. Yes, sir.

The CHAIRMAN. What about these patents? Are we going to get into trouble, and would we be in trouble about the patents on the Haber process?

Doctor PARSONS. No, sir, I think not. I can not see but what the patent situation, so far as the Haber process is concerned, is practically free. The Haber patents were all taken over by the Alien Property Custodian and belong to the Chemical Foundation and are available to any American company on the same terms with any other American company. That, I think, is definitely determined, and it is generally known. The specific patent of the General Chemical Co. to operate under 100 atmospheres could not be used without reference to the General Chemical Co., but it makes very little difference whether you operate at 99 or 101 atmospheres.

The CHAIRMAN. Well, in the construction of plant No. 1 where all of those concerns had new developments and found out what their mistakes were, did that result in any patents being issued for the improvements that were brought about by the joint action of the Government and the company?

Doctor PARSONS. I know of no patents that would stand in the way of the operation of that plant. However, I am one of those that believe very strongly that the United States Government and the people of the United States do not wish, and can not afford to treat any of their contracts, when they are issued in good faith, as "scrapes of paper," contracts that are morally binding, even though there may be certain legal technicalities. Therefore, I believe that any arrangement we made with the General Chemical Co. about the use of their patent should be strictly held to, and that is why I put in my offer that any apparatus built by them should be removed from the premises and not considered a part of the purchase. We have not asked for the privilege of the use of any of their patent rights.

The CHAIRMAN. Well, you did not understand me; probably I did not make myself clear; but, as I understand it, in the construction of this plant there was some kind of a contract between the Government and those who were constructing it about the improvements that should be made in the meantime by the cooperation of the Government experts and their experts. Now, as I understand it—and I may be wrong about it—that cooperation did result in several improvements.

Doctor PARSONS. Yes.

The CHAIRMAN. Were those improvements patented?

Doctor PARSONS. Not so far as I am aware. They were almost solely improvements in mechanical strength, in making their pressure cylinder heads stronger, so that they would not bulge; in fixing up various places where there were leaks; but more especially the improvement has been made in the catalyst. That is the substance which is essential for the combination of nitrogen and hydrogen to form ammonia. Now, the catalyst which the General Electric Co. uses to-day is entirely different from the catalyst which was used in plant No. 1 at Muscle Shoals. That catalyst did not function because they could not make it on a large scale as they did in the laboratory. They now have a secret catalyst. The Nitrogen Fixation Laboratory also has developed a catalyst in the last year, which is superior, in my opinion, to any other catalyst in the world.

The CHAIRMAN. That is a Government laboratory?

Doctor PARSONS. The Government laboratory, and that would be available to any plant which might be added in plant No. 1. That was discovered by Government employees.

Senator NORBECK. The information I got from one of the engineers was that the failure of the Haber process at Muscle Shoals was due to the fact that they attempted to carry 1,500 pounds of pressure in steel pipes at the same time that they carried a temperature of 1,500 centigrade.

Doctor PARSONS. No; that was around 500°, Senator.

Senator NORBECK. Oh, 1,500 Fahrenheit?

Doctor PARSONS. No; it is 1,500 pounds pressure per square inch and about 500° centigrade.

Senator NORBECK. And they were not able to get pipes that would carry that pressure, with that heat?

Doctor PARSONS. That was one of the difficulties that arose.

Senator NORBECK. Can that particular thing be removed?

Doctor PARSONS. Oh, yes. It has been in all of the plants operating in the world, because they are all working under similar or more difficult conditions.

Senator NORBECK. By the manufacture of pipe that will stand pressure at high heat?

Doctor PARSONS. No.

Senator NORBECK. No such pipe was available at the time of this construction?

Doctor PARSONS. Yes; but they have had to find out these things by trial.

Senator NORBECK. That is practically the same experience that the German people had in building their plant?

Doctor PARSONS. Exactly, and that was the experience at Muscle Shoals in plant No. 1 which had to be closed down at the time of the armistice.

Senator NORBECK. It is your idea that if our people could have kept on for another year, they would have operated that Haber plant successfully at Muscle Shoals?

Doctor PARSONS. That is not only my idea, but that is the idea of everybody that had any connection with the plant.

Senator NORBECK. And in your opinion that would have resulted in a much cheaper output than would have been produced at the other plant?

Doctor PARSONS. Unquestionably.

Senator HEFLIN. What do you think it would cost to put the Haber plant in operating condition at plant No. 1?

Doctor PARSONS. I think, with the material already there at plant No. 1, to bring it up to a 30-ton-per-day capacity—which is the capacity originally estimated—it would cost in the neighborhood of \$2,000,000. I am lower in that figure than are some of the Ordnance people. They may be nearer right than I am, but I have a pretty good basis for my calculations, because I know something about costs in other plants.

Senator HEFLIN. You think, then, that with the expenditure of \$2,000,000 it could be made a perfectly good plant?

Doctor PARSONS. It could be made a perfectly good plant to that extent; yes, sir.

The CHAIRMAN. Then, what would its capacity be?

Doctor PARSONS. Thirty tons of ammonia per day. I am merely talking about the plant itself. There may be other accessories that will have to be put in which will cost more, as was the condition when the original plants were put in down there. Of course, the so-called cost of plant No. 1 was originally estimated at about \$7,000,000,

and it really cost \$13,000,000, but the \$13,000,000 included many things not estimated for in the first estimate, like the ammonium nitrate plant, the oxidation plant, the plant for the concentration of nitric acid, and other things.

Senator NORBECK. And those 85 residences.

Doctor PARSONS. Yes, sir; the residences and the water works and railroad tracks. I am not prepared to say that I should not like to have more than \$2,000,000 available if I were going to undertake the work, but I believe the plan can be carried out and the plant put in operation for that amount.

The CHAIRMAN. Were you there during the construction of plant No. 1?

Doctor PARSONS. Yes, sir. Yes and no. I was there during the whole latter part of the construction of plant No. 1.

The CHAIRMAN. Were you located there?

Doctor PARSONS. Oh, no, I was not located there. I beg your pardon.

The CHAIRMAN. What portion of your time did you spend there? Were you actually engaged in the construction?

Doctor PARSONS. I was not, in any sense at all.

The CHAIRMAN. What was your purpose in going down there?

Doctor PARSONS. I went there as a member of the Nitrates Commission.

Senator NORBECK. If that plant is remodeled at a cost of approximately a couple of million dollars, as you suggest, you are satisfied that, in all probability, it will operate successfully?

Doctor PARSONS. Yes.

Senator NORBECK. In that event, how much cheaper will they produce than will the cyanamide plant which is there?

Doctor PARSONS. I should have to have a number of basic facts to go on to answer that question.

Senator NORBECK. Would you be willing to look that up?

Doctor PARSONS. I can answer your question here, if you will get down to the points, so that it will be correctly answered when I have answered it.

Senator NORBECK. Yes.

Doctor PARSONS. Do you assume that you will use the secondary power to produce your hydrogen, or do you calculate that you are going to use your steam power to produce your hydrogen?

Senator NORBECK. Let us assume that the horsepower cost three-fourths of a mill on the cyanamide process. How much cheaper, if any, do you think you could produce under the Haber process, with the present steam plant, after you have remodeled it, as you suggest?

Doctor PARSONS. I think you could produce ammonia for from 75 to 80 per cent of the price that you could hope to produce it with the cyanamide process.

Senator NORBECK. Even with that very cheap power?

Doctor PARSONS. Yes; even with that very cheap power, from 75 to 80 per cent, and perhaps less. The Ordnance Department and the Nitrogen Fixation Laboratory have estimated that they can produce ammonium sulphate at plant No. 2 on the basis of about \$65 per ton—that is, under commercial conditions—\$65 per ton of ammonium sulphate. Now, I do not think they can; in fact I feel absolutely certain that they can not.

Senator NORBECK. You think it would cost how much?

Doctor PARSONS. At least \$75 and perhaps \$80.

Senator NORBECK. And you think, with the Haber process and with the secondary power, you might produce it at how much?

Doctor PARSONS. Around \$50 a ton. That is, if you operate it by a commercial concern.

Senator NORBECK. May I ask you this question, Doctor? Out of this \$50 or \$60 a ton what part of the expense would be power?

Doctor PARSONS. Again, you must take into consideration whether you are going to use power to produce your hydrogen or coal to produce your hydrogen?

Senator NORBECK. I mean after you have remodeled it at an expense of a couple million dollars, as you said awhile ago.

Doctor PARSONS. If you are going to produce power to produce hydrogen—

Senator NORBECK. Is that what you have implied when you say you would remodel your plant by spending a couple million dollars on it?

Doctor PARSONS. That is the method I should use down there, yes. I am afraid I will have to put that in the record, to be accurate.

Do you know what it is, Major [addressing Major Burns]?

Major BURNS. According to that scheme you would use about 4,000 kilowatts per ton of ammonium sulphate. On the basis of a mill per kilowatt hour, your power cost would be \$4 per ton of ammonium sulphate. On the basis of 4-mill power it would be \$16 per ton.

Doctor PARSONS. I am talking about mill power only.

Major BURNS. Assuming it at \$50 a ton, your power charge would be \$4 and your percentage would be 8 per cent, or 4 divided by 50. That is in round figures.

Doctor PARSONS. You are considering making the hydrogen electrolytically.

Major BURNS. That is what I understood you to say.

Doctor PARSONS. I do not have those figures in my mind. I have had them all calculated out, and I can give them to you exactly.

Senator NORBECK. We are trying to find out how much it will help toward the cheapening of fertilizer.

Doctor PARSONS. The only power at Muscle Shoals that will do any good is that secondary power.

The CHAIRMAN. You would have to do that with the Haber process.

Doctor PARSONS. You would have to do it with the Haber process. In my opinion you can not use secondary power or any other power, even if your power cost you nothing, to run the cyanamid plant and make fertilizer at any cheaper rate than it is to-day. I think you ought to examine quite carefully the various records bearing upon that matter. I think you ought to get the so-called Exhibit B that was introduced in the House hearings, put in by the Ordnance Department, in which they made their estimate of the operation of the cyanamid plant, showing, at the request of Mr. Fields, what the outcome would be in operating that plant for six years.

They estimated that if we should operate that plant for six years, we would lose \$2,919,000, and in order to get that loss they have taken the ammonium sulphate at \$65 a ton. That price for ammonium sulphate is not "cheap fertilizer." Ammonium sulphate in 1921 sold for an average of less than \$50 a ton. It sold for \$40 a ton, and there was a lot of it that was sold in the low thirties. If you take \$50 a ton as the price of ammonium sulphate in plant No. 2, according to the estimate of the Ordnance Department—and, in my opinion, those estimates are low—you would lose in those six years over \$22,000,000 by operating the plant. That is on the basis of secondary power.

Senator NORBECK. And you would not be furnishing cheap fertilizer.

Doctor PARSONS. That is on the basis of \$50 a ton for ammonium sulphate.

Senator NORBECK. That is not a cheap fertilizer?

Doctor PARSONS. It is more than the average price for the last year.

The CHAIRMAN. Now, to get down to a practical solution of that difficulty, it would be your judgment, as I understand it, that plant No. 2 is useful and should be considered and kept as a war proposition, and that the other plant, under the method you have described, should be operated by secondary power. Is that about right?

Doctor PARSONS. That is right; yes, sir.

The CHAIRMAN. If the Government, for instance, retains it?

Doctor PARSONS. But basic to all of that, I want to go very strongly on record by saying that no matter what you would do at that plant, through that power, you are not going to get "cheap fertilizer" for anybody.

Senator HEFLIN. Mr. Ford says he can make cheap fertilizer if we give him that power under the arrangement that he has suggested to the Government.

Doctor PARSONS. It is important, I think, that you should all read very carefully both the House records and the Senate records. Mr. Mayo is unquestionably a most excellent engineer and understands water power and engineering propositions, but he has shown throughout his testimony that they have had nobody that was familiar with fertilizer production advising them at all. His testimony is decidedly varied as given before the House committee and this committee. It has been distinctly changed. In the House committee he stated several times that they would not operate plant No. 2 at all, unless they could operate it at a profit. That is shown to be Ford's statement and the belief also of practically everyone who has studied the situation among the higher officials. For example, Secretary Weeks shows very clearly in his testimony that he does not consider that this offer carries any real assurance in any way that any fertilizer or nitrate will be made.

General Williams says:

"If the Ford offer means, in the case of the No. 2 plant, that such plant will be operated at its approximate capacity for the fixation of nitrogen," etc.

General Beach says:

"Direct benefits accruing to the United States are (b) production in the interest of public welfare of large amounts of fertilizer at a cost not exceeding the reasonable cost of production, providing that the production of nitrates adapted to fertilizer purposes is found to be practicable."

The Secretary of Agriculture in his statement to you was no less noncommittal. The authorized statement given out by Director Tolman favors the Ford offer only "if its terms are sufficiently definite and binding to make sure that the plant will be operated continuously for the manufacture of fertilizer."

Mr. Ford, according to Secretary Weeks, states definitely that plant No. 2 will not be operated unless it can be operated at a profit, and Mr. Mayo definitely confirms this statement in his testimony before the House committee.

Now, as to the question of price, I specially had copied from the record the following, if I may put it in to show where that question of the "one-half price" arose, and to bring out another point which Mr. Mayo, I think, did not bring out in his testimony here, namely, that before the House committee he said that the offer meant they would make 2,000,000 tons of fertilizer. Here he simply spoke of 110,000 tons of ammonium nitrate, and there is a very great difference between the two.

Senator HEFLIN. He testified here that it was Mr. Ford's intention to manufacture fertilizers on a large scale.

Doctor PARSONS. The difficulty in the whole situation is the question of Mr. Ford's intention, but the thing that you want is Mr. Ford's guaranty. I am sorry that Mr. Ford has not himself come here and put himself on record.

Senator HEFLIN. He has modified his proposal somewhat, you know, and states that he agrees to make commercial fertilizers.

Doctor PARSONS. As to the commercial fertilizers, I will bring that out. May I read you this paragraph?

The CHAIRMAN. Yes.

Doctor PARSONS. It is as follows:

"Mr. GARRETT. You stated in answer to a question by some gentleman here this morning that you thought he could make fertilizer 50 per cent cheaper than it is to-day.

"Mr. MAYO. We think so; yes, sir.

"Mr. GARRETT. On what do you base that statement?

"Mr. MAYO. Well, we base that on a number of processes, any one of which we may adopt."

And all through his testimony it has been "any number of processes." They apparently have not any expert advice on the nitrogen situation whatsoever.

Senator HEFLIN. He claims they have a secret process.

Doctor PARSONS. Yes; he talks about that, and he also says that they have a process of making fertilizer as an adjunct to electric steel and aluminum. That process has been well known for fifteen or twenty years, and if he did not have any process three months ago, I do not think, as he has no nitrogen experts with him, that in three months he has developed anything very wonderful or has brought it out in a way that would give you any basis for accepting it.

Senator HEFLIN. But, of course, you do not know whether he has or not.

Doctor PARSONS. No; nobody knows anything about it at all; but we do know that the lime slag iron obtained from iron ore which contains phosphate takes the phosphorus out of the iron ore, and this so-called Thomas slag has been used for fertilizer purposes in Europe and in America for a long time. We also know in connection with the manufacture of aluminum, that there has been a process originally devised by Serpek in France, and worked in this country by the Aluminum Co. of America, and which has been abandoned by both after the expenditure of hundreds and hundreds of thousands of dollars, it having been found to be entirely impractical. In my opinion it will always be impractical, on account of the very high heat that has to be used, and various other conditions.

I will go ahead with this testimony now, if I may:

"Mr. GARRETT. You mean that you have in mind processes for the manufacture of fertilizer that have not yet been developed by any of the other companies?

"Mr. MAYO. Yes sir; or partly developed by some of them.

"Mr. GARRETT. What I want to get at is this: Regardless of that, because that is something we do not know about now, but we do know that fertilizer is being made, and how it is being made, and how it is being distributed now.

"Mr. MAYO. Yes, sir.

"Mr. GARRETT. And what I want to get in the record is how much cheaper can Mr. Ford, in your opinion, make fertilizer at this plant if the Government accepts his offer, at the rate of about 2,000,000 tons per year than it is being made generally throughout the country?"

Mr. Mayo at those other hearings testified that 2,000,000 tons of fertilizer was the equivalent of 110,000 tons of ammonium nitrate, simply because the 2,000,000 tons does contain the same amount of nitrogen as the 110,000 tons, forgetting that if you made all of those things by the electrothermal method you would be using more power than Muscle Shoals would supply.

"Mr. MAYO. Of course, we are green at the fertilizer business, and I could not exactly say, but Mr. Washburn in his statement said he thought it could be made there at about one-half the price."

There is the original basic thought upon which all of this one-half price has been based. Mr. Washburn, in his original talk before the House committee, before the war, when he was trying to get Muscle Shoals developed, thought that he could make fertilizer down there for one-half price, and Mr. Mayo simply adopted that statement, and, in my opinion, he has nothing else whatever to go on, for, as I have said before, if you take 2,000,000 tons of fertilizer, and put in it the total amount of nitrogen that is present for nothing, it would not reduce it 33½ per cent.

"Mr. GARRETT. Do you think you would be safe in saying to the committee, as the spokesman of Mr. Ford, that it would be made 33½ per cent cheaper than it is being made and distributed to the farmer now?"

"Mr. MAYO. Yes, sir."

Now, if you could get him to guarantee that 2,000,000 tons of fertilizer a year and a 33½ per cent reduction in price, I am for the Ford offer.

Senator KEYES. In your opinion could that plant No. 2, under this proposal or any other proposal made to this committee, be operated so as to materially reduce the price of fertilizer to the farmers of this country?

Doctor PARSONS. No, sir; I do not.

Senator HEFLIN. Then, you do not think there is any hope for fertilizer users in this country; that it must remain in the hands of the fertilizer trust?

Doctor PARSONS. I do not think there is any fertilizer trust, Senator.

Senator HEFLIN. Don't you?

Doctor PARSONS. I have seen in the last few years the strictest competition between them. I think if you will look into their profits that the stock has been down to almost nothing in all cases, and they have been paying no dividends. As to there being any "trust," I think it is just as much a shibboleth as the question of this "cheap fertilizer." I do not own any fertilizer stock, nor am I interested, directly or indirectly, in any fertilizer company, but I believe that is absolutely true. Now, the more fixed nitrogen you can produce and the more you develop methods for production, the more you decrease the price of fixed nitrogen to the farmer in his fertilizer. I am thoroughly desirous of seeing that accomplished, and I believe it is going to be accomplished, but it is not going to be accomplished through Muscle Shoals or any other power proposition.

Senator HEFLIN. Why, then, do you suppose these commercial fertilizer concerns are fighting the Ford offer, unless they are afraid that he will reduce the price of fertilizer?

Doctor PARSONS. If they think that a man is going to have an immense business given to him on a gold platter with a bonus, they naturally hesitate to have the supply of the country increased by 25 per cent under those conditions, to compete with them immediately, because it would probably be a very serious thing. At least, that is the way it seems to me. Now, when you give that immense power to a person simply on the basis of cheap fertilizer, you are giving one of the biggest subsidies ever given in American history to any one man. I do not care whether it is Mr. Ford or anyone else. Mr. Ford, of course, is a dreamer of dreams, one of which has come true, and Mr. Mayo said that this cheap fertilizer was one of his dreams. In that connection Mr. Mayo has said:

"It is Mr. Ford's dream in regard to this fertilizer product to make the price of it such that anybody can use it in any quantity they wish to; that the expense would not prevent them from using all they should use."

That is a beautiful dream and I hope it will come true, but I maintain it is not coming true through Muscle Shoals.

Senator HEFLIN. You know, some of them claim that they will use 500,000 horsepower in that river at those three dams. What do you think of that?

Doctor PARSONS. Five hundred thousand horsepower?

Senator HEFLIN. Yes.

Senator KEYES. For what purpose?

Senator HEFLIN. For any purpose.

Doctor PARSONS. When they get those dams going—and do not misunderstand me; I am not against the building of those dams to get the power for industrial use, I am for it; but I do not want to see it developed under a false premise. You need those industries in Alabama, you need those industries in Tennessee, and you need those industries in my own home State of Georgia. You need that power for the development of our industries. There is only one great fault, you must remember, and that is that the people down there have the idea that this will bring in thousands of people, as they thought would be the case at Niagara Falls. The actual facts are that when they developed Niagara Falls, taking into consideration the textile industry at Lawrence, they thought they were going to get a city of 3,000,000 inhabitants, and they did not get more than 15,000. Down there, you will not get any more, because it will not require that many people to run it. Electrochemical industries do not mean

people. I want to see the dam completed and the power used all through the South, the same as around New York and other places.

Senator HEFLIN. You do not want to see Mr. Ford's offer accepted, do you?

Doctor PARSONS. I do not believe any such asset as that immense power should be given as a bonus to any American citizen. You should either sell it properly or you should develop it yourselves.

Senator HEFLIN. Well, if he should be able to manufacture cheap fertilizer, it would be a great service to millions of farmers, would it not, if the Government let him have it?

Doctor PARSONS. I think the getting of cheap fertilizer would be a great service to the American farmers; yes, sir; but it is not coming that way.

Senator KENDRICK. I would like to ask you a question right there, Doctor PARSONS. Is it your opinion, based on statements you have made, that the Government owning and controlling power and leasing such of it as there may be found a market for, particularly the primary power, and proceeding in its own way to keep one of those plants operating for the production of nitrogen, would be just as apt, even more apt, to reduce the cost involved in the production of nitrates as any private individual or corporation?

Doctor PARSONS. No, Senator; I am not in favor of Government operation of any commercial organization of this kind. If you go into the production of nitrates by the Government it means that you will have to take up the whole fertilizer business, and it means—

Senator KENDRICK. I want to interrupt you there to say that the primary purpose of the whole scheme has been, or that is, it was in its initiation, to provide nitrates for the use of the Government in war time.

Doctor PARSONS. Quite right.

Senator KENDRICK. Now, in order to have an effective and efficient plant for the production of nitrates when war comes, this plant or some other plant must be kept in operation.

Doctor PARSONS. I agree with you very heartily.

Senator KENDRICK. So it would not be entirely a commercial proposition.

Doctor PARSONS. What I personally believe in is that plant No. 2 should be kept in a stand-by condition at a cost of something like \$100,000 a year. It can be ready to operate at a moment's notice, until such time as we have other reserves, so that there will be no need for keeping it. I am of the opinion that the fixation of nitrogen will be developed most rapidly and most efficiently by private competition, and I believe that private competition is in sight. I do not believe that anyone has a monopoly of the fixation of nitrogen in this country, and that it is quite possible, and in fact practically certain, that there will be strong competition in the development of synthetic ammonia processes. The future fixation of nitrogen is going to be through the synthetic processes, although, of course, no one is prepared to state that some wonderful discovery may not be made to-morrow. I do not wish to intimate that we have improved as much as we will ultimately improve it, or to be through, but the use of the synthetic processes is the present outlook. Now, personally, I believe you would get furthest by carrying out exactly the plan I have put in my offer there, that plant No. 1 should be sold, we will say, to the highest bidder, and that the secondary power to operate that plant be in some way furnished.

Senator HEFLIN. So it is possible, then, you say, for the discovery any day of a process that will produce the stuff cheaper than it is produced to-day. Now, Mr. Ford says that he has a secret process by which he will be able to make it much more cheaply than it is made to-day.

Doctor PARSONS. There was a lecture given by Mr. Ashton at the Cosmos Club a few days ago in which he stated that the first man who set free the energy which we know to be present in the atom might, by that very act, set free the energy of all of the atoms and thereby blow the earth into a nebula. I think there is as much probability in one as in the other. I am willing to say that both of them are possible.

Senator HEFLIN. You think it is possible for somebody to discover something to-morrow that will be a much cheaper process than that which you have to-day, yet you think it is impossible for Mr. Ford to get hold of one of those processes.

Doctor PARSONS. I did not say that I thought it was impossible. I said it was just as probable he had developed this wonderful secret process in two months as the other of those two things which I mentioned. I am not denying the possibility of anything. Senator.

The CHAIRMAN. Now, Doctor PARSONS, I want to get back to where I started out with you when somebody else took you away from me. At that time I had not gotten out what I wanted to get out. You were talking about operating plant No. 1 on

secondary power. Will the secondary power that will be made, say, for 10 months in the year, be more than enough to operate plant No. 1 under your plan?

Doctor PARSONS. That depends entirely on the extent to which plant No. 1 is enlarged. It would be much more—

The CHAIRMAN. I am speaking of it as it stands now.

Doctor PARSONS. It would be much more than enough to operate it as it stands. The actual fact is that with 100,000 secondary power available 10 months of the year, it will give just about the output that No. 2 would give, provided there was the necessary installation at No. 1 to utilize that power for the electrolysis of water.

The CHAIRMAN. Then, it would mean this, that there would be secondary power enough developed at Dam No. 2 to operate the Haber process planned under your plan, with an annual capacity of 40,000 tons of nitrogen?

Doctor PARSONS. You have it absolutely right, Senator. It would be slightly in excess of that.

The CHAIRMAN. That would mean as much as a war proposition as nitrate plant No. 2 could do running to its full capacity, regardless of expense?

Doctor PARSONS. It would mean very much more as a war proposition, simply because you would have an operating plant, a modern commercial plant, and you would have to keep that up to date all the time.

The CHAIRMAN. To do that, how much would you have to increase the capacity of plant No. 1?

Doctor PARSONS. Five times.

The CHAIRMAN. Five times; and how much money would it cost?

Doctor PARSONS. Government built or privately built?

The CHAIRMAN. Well, both ways. Give it to us both ways.

Doctor PARSONS. Well, I should want around \$15,000,000 to \$20,000,000.

Senator NORBECK. For which way?

Doctor PARSONS. Am I going to do it?

Senator NORBECK. Give it to us the private way and the ordinary Government way, so that we can have the comparison. It would be \$30,000,000 Government built, then, would it?

Doctor PARSONS. I do not think I had better make that comparison, Senator. I think that, efficiently done, \$15,000,000 to \$20,000,000 would cover the situation. That is the best way for me to put it.

Senator NORBECK. The chairman and I do not agree on the degree of Government efficiency.

The CHAIRMAN. I want to have it in the most efficient way.

Doctor PARSONS. I think \$20,000,000 would be sufficient.

The CHAIRMAN. Well, you are speaking now of letting it by contract to some private individual, and if you mean that is the efficient way, that is the way I want you to make your estimate.

Doctor PARSONS. No; I would not let it by contract.

The CHAIRMAN. Well, the cheapest way that you could do it and have it good.

Doctor PARSONS. Well, say \$15,000,000.

The CHAIRMAN. All right.

Doctor PARSONS. I would like to have the privilege of placing that figure in the record.

The CHAIRMAN. All right, if you care to. I would like to know the figure.

Doctor PARSONS. But I think that is essentially correct.

The CHAIRMAN. When we reach that point—

Doctor PARSONS. Major Burns said he would put it at \$20,000,000.

The CHAIRMAN. How many years would it take to have that done? It would not take more than a year or two, would it?

Doctor PARSONS. Oh, yes, sir. Nobody ought to go at a matter of that kind at once. It would not be a proper procedure. You ought to build your first 10-ton unit and operate it for six months and then increase to your 30 and operate that for a year and a half, and then go ahead and put in your full construction. Remember, you can not do anything with this until you get your secondary power.

The CHAIRMAN. I am asking you to outline it. It would take three or four years before you would be consuming your secondary power?

Doctor PARSONS. Yes, sir.

The CHAIRMAN. To its maximum, at that one dam. Now, in the meantime, you would have a lot of secondary power to sell if you could find a market for it, under your plan?

Doctor PARSONS. There is very little market for secondary power there.

The CHAIRMAN. That is true, unless it is something that it is peculiarly situated, so that the people need the power.

preliminary to the installation of nitrogen-fixation plants in this country, and, later, throughout the war, as a member of the nitrate commission in frequent consultation with Secretary Baker, Assistant Secretary Crowell, and the officers of the Ordnance Department, especially those of the nitrate division. I have since made three trips to Europe and have kept in constant touch with the advancements in nitrogen fixation and with the individual engineers, chemists, and chief executives of many of the fixed-nitrogen plants abroad as well as in this country. I have the necessary experience and knowledge of new methods to direct the design and installation of a synthetic-ammonia process at plant No. 1 which will operate commercially. The patent situation offers no difficulties.

I have constantly advised that the cyanamid process was becoming obsolescent while the synthetic-ammonia processes—variously designated under the names of Haber process, the Claude process, and the General Chemical process—were rapidly becoming the sole commercial procedure for the fixation of nitrogen for fertilizer and explosive use. The practical obsolescence of the cyanamid plants throughout the world, as detailed in my recent testimony before the Military Affairs Committee on March 13, is in entire accord with my prediction. The remarkable success of the General Chemical Co.'s synthetic-ammonia process in its second installation at Syracuse entirely justifies its first trial installation at plant No. 1 at Muscle Shoals. The fact that a plant to produce 100 tons of fixed nitrogen per day is on the way to completion, using a similar process, at Billingham, England; the fact that an immense cyanamid plant at Odda, Norway, nearly one-half the size of the cyanamid plant at Muscle Shoals, was sold on February 11 for 50,000 kroner, approximately \$10,000 present exchange or \$16,000 at normal exchange; the fact that this Norwegian plant is planning to convert its water power to exactly the same use I suggest in the accompanying offer, using a synthetic-ammonia process; and the fact that installations of similar synthetic processes are under way in France, Italy, and Japan, is proof of the correctness of the stand I have always taken.

In order that the accompanying offer may not exclude anyone who may differ from me as to the possibility of operating commercially for cyanamid at plant No. 2, provisions are made so that this plant may be operated by others if the Government so elects and can find lessees therefor.

This offer is made with the intent of developing at Muscle Shoals an industry for the fixation of nitrogen which has possibilities of a greater output of fixed nitrogen than can be produced at plant No. 2. It contemplates the production of calcium carbide and of acetylene therefrom for use in autogenous welding. These products will be made especially with a view to the utilization of a part of the oxygen gas produced, otherwise as a waste product, in the electrolytic production of hydrogen. In view of the extended discussion in the public press of philanthropic fertilizer production, I wish to state frankly it is intended to operate these plants for business purposes, with the expectation of a fair business profit.

If the offer is accepted and the water power is allocated to the company which I will form, plant No. 1 will be converted into a plant for the fixation of nitrogen by the Haber process or a modification thereof. This process is turning out to-day in Germany 300,000 tons per annum of fixed nitrogen, equivalent to nearly 1,500,000 tons of ammonium sulphate, which is sold in Germany on a basis of between \$25 and \$30 per ton, equal to about one-half of the price for ammonium sulphate in America. The conditions in Germany are, of course, unusual, but rapid advancements are being made in the Haber process, and there is every reason to believe that if plant No. 1 is operated that it will have at least a stabilizing effect upon the fertilizer market and, since the supply will be greatly increased, will tend to decrease the market price of nitrogenous fertilizer.

The company will also undertake to operate certain of the carbide furnaces for the production of phosphoric acid and potash if it is found that it can be done profitably by electrothermic methods.

In closing I think I should add, to forestall unnecessary comment, that while I have assurance of financial support which will enable the company to meet its obligations as they may mature, this offer is made without the knowledge or connivance and without expectation of connection with any of the parties who have so far been mentioned before the Military Affairs Committee as interested in the Muscle Shoals situation. Those to whom I refer are acting from no standpoint of assistance or antagonism to any offer now before Congress, but simply with the hope of developing an important profitable industry in Alabama and Tennessee if the water power becomes available either through the acceptance of the offer of the Alabama Power Co. or through the Government itself completing Dam No. 2 and offering the power therefrom for sale.

Sincerely yours,

CHARLES L. PARSONS.

CHAIRMAN. Now, Doctor, I wish you would—

KENDRICK. Mr. Chairman, there is just one question I would like to ask doctor leaves that subject.

MAN. All right; go ahead, Senator.

KENDRICK. I want to ask a question in connection with your statement that plant No. 2 should be kept in stand-by condition until the emergency passed. Is it your opinion that the plants should be maintained with efficiency standing idle as if they were kept in operation?

Yes, sir; this is a peculiar plant in that way, Senator Kendrick. It is made up quite largely of materials which do not readily deteriorate; stone and cement and mortar and copper wire, copper leads, furnaces, the chief parts of which are made of fire brick. A material that normally oxidizes in the air or that goes to pieces. It is in a stand-by condition for a very long time, especially that I should have any thought of operating. It is quite possible that the plant would be a little more difficult to keep in shape, but it would shape easily, because it is quite largely enameled iron. The plant is largely brick and mortar. The ammonium plant, already been superseded, and I do not think will be as the cyanamid plant is concerned, the portion of the plant could with very slight expense be kept in operation a number of years.

Nothing in your testimony about \$100,000 being

expended, I think, is the actual experience of the Ordnance Department, year or two.

CHAIRMAN. Doctor, let us go back again to where I was. You said something about salaries provided for, and I suppose you were referring to the bill that I have introduced.

Doctor PARSONS. Yes, sir.

The CHAIRMAN. It was not my idea, Doctor, in providing that the salaries should be fixed at \$7,500 annually, that we should employ chemists, or anything of that kind. Is it your idea, if that method were adopted, that the board ought to consist of men of that kind who are especially educated in scientific lines?

Doctor PARSONS. I think that on a board of three men, as you have it there, there should be at least one of them who is thoroughly technically educated along these lines, and that the others should be business men of vision and of successful experience. I do not believe you can get any such men, either the technical men or the business men, who would give up their time to a proposition of that kind for less than three or four times the salary per individual that you have provided for there. I know that any industrial corporation in a proposition of this kind would pick the best men that they could find in the country, and in order to get them, would pay those salaries, and I know that the best man is the cheapest, irrespective of what you pay him.

The CHAIRMAN. You may be entirely right about that, Doctor, and I do not want to criticize your position at all, because I think your position is the one that probably would be sustained by most people; but my idea was that on the board who would operate this proposition you would not necessarily have chemists or engineers. In fact, if I were selecting those men, I do not believe that I would select any one of them because of the fact that he was a chemist or an engineer, but I would select, rather, broad-minded business men, and they would employ such chemists and such engineers as they needed. For instance, if I were selecting them and I could get a man like Mr. Ford, I think I would pick him as one of the men to handle this great concern, although he is neither an engineer nor a chemist, and I believe that I would be competent myself to handle that thing, although I am only getting \$7,500 a year, and I can not save nearly as much out of that salary as I could if I were handling that job.

Doctor PARSONS. I know, for I worked for the United States Government eight years of my life. You are doing it the same as I did, solely for the personal satisfaction of accomplishment.

The CHAIRMAN. Yes, sir; yes, sir.

Doctor PARSONS. Nothing else.

The CHAIRMAN. Now, could you not get those men and give them this life job?

Doctor PARSONS. No; that is a commercial business.

Senator NORBECK. The marble halls are missing; is that it?

Doctor PARSONS. Government service has both its advantages and disadvantages. It seems to me sometimes as if the men who were doing the best work in some of the departments are the ones who are blamed and received the most criticism.

Senator NORBECK. Your offer includes those residences as well as other property on the ground?

Doctor PARSONS. Yes, sir.

Senator NORBECK. There are 85 of those residences on the ground.

Doctor PARSONS. \$600,000 is the price given by General Williams.

Senator KENDRICK. That does not include the steam plant.

The CHAIRMAN. Oh, yes.

Senator KENDRICK. The big steam plant.

The CHAIRMAN. Oh, no; the little one.

Doctor PARSONS. The one at plant No. 1.

The CHAIRMAN. It includes everything at plant No. 1?

Doctor PARSONS. At No. 1; yes.

The CHAIRMAN. And nothing else?

Doctor PARSONS. Yes; and nothing else.

I don't see that that offer requires any action on the part of this committee unless you should be in position to accept the Alabama Power Co.'s offer or complete the work yourselves. At the same time I thought it proper to explain with reference to it, and I have tried to put everything clearly before you, so that there would be no question.

The CHAIRMAN. There is one thing that arises in my mind. You get 100,000 secondary power, but there is just a little difference of opinion among the experts as to whether some of what is considered primary power might not technically be secondary power. For instance, they say we get 87,300 horsepower that they call primary power at Dam No. 2, but, as a matter of fact, could not some of that be technically called secondary power, because it is only 97 per cent of the time that there would be 87,300 horsepower available.

Major BURNS. You would have 87,300 horsepower available 99½ per cent of the time.

Doctor PARSONS. That is primary power. In most years you would have it more than that.

The CHAIRMAN. Yes; most years more than that. But to be real technical, now, that is not really primary power, is it?

Doctor PARSONS. It is not always an easy matter to separate exactly between primary and secondary power where you have a fluctuating flow, but contracts have been drawn between water power companies covering that question, and could be drawn so that it is understood by all parties and would be administered equitably.

The CHAIRMAN. What would be your understanding, Doctor, as to the amount of primary power?

Doctor PARSONS. Down there?

The CHAIRMAN. Yes.

Doctor PARSONS. Exactly as given you by Major Burns. He is better prepared to speak than I am.

The CHAIRMAN. You would count 87,300 horsepower as primary power?

Doctor PARSONS. Yes, sir.

The CHAIRMAN. Even though it is available only 99½ per cent of the time?

Doctor PARSONS. Yes, sir.

The CHAIRMAN. What about these patents? Are we going to get into trouble, and would we be in trouble about the patents on the Haber process?

Doctor PARSONS. No, sir, I think not. I can not see but what the patent situation, so far as the Haber process is concerned, is practically free. The Haber patents were all taken over by the Alien Property Custodian and belong to the Chemical Foundation and are available to any American company on the same terms with any other American company. That, I think, is definitely determined, and it is generally known. The specific patent of the General Chemical Co. to operate under 100 atmospheres could not be used without reference to the General Chemical Co., but it makes very little difference whether you operate at 99 or 101 atmospheres.

The CHAIRMAN. Well, in the construction of plant No. 1 where all of those concerns had new developments and found out what their mistakes were, did that result in any patents being issued for the improvements that were brought about by the joint action of the Government and the company?

Doctor PARSONS. I know of no patents that would stand in the way of the operation of that plant. However, I am one of those that believe very strongly that the United States Government and the people of the United States do not wish, and can not afford to treat any of their contracts, when they are issued in good faith, as "scrap of paper," contracts that are morally binding, even though there may be certain legal technicalities. Therefore, I believe that any arrangement we made with the General Chemical Co. about the use of their patent should be strictly held to, and that is why I put in my offer that any apparatus built by them should be removed from the premises and not considered a part of the purchase. We have not asked for the privilege of the use of any of their patent rights.

The CHAIRMAN. Well, you did not understand me; probably I did not make myself clear; but, as I understand it, in the construction of this plant there was some kind of a contract between the Government and those who were constructing it about the improvements that should be made in the meantime by the cooperation of the Government experts and their experts. Now, as I understand it—and I may be wrong about it—that cooperation did result in several improvements.

Doctor PARSONS. Yes.

The CHAIRMAN. Were those improvements patented?

Doctor PARSONS. Not so far as I am aware. They were almost solely improvements in mechanical strength, in making their pressure cylinder heads stronger, so that they would not bulge; in fixing up various places where there were leaks; but more especially the improvement has been made in the catalyst. That is the substance which is essential for the combination of nitrogen and hydrogen to form ammonia. Now, the catalyst which the General Electric Co. uses to-day is entirely different from the catalyst which was used in plant No. 1 at Muscle Shoals. That catalyst did not function because they could not make it on a large scale as they did in the laboratory. They now have a secret catalyst. The Nitrogen Fixation Laboratory also has developed a catalyst in the last year, which is superior, in my opinion, to any other catalyst in the world.

The CHAIRMAN. That is a Government laboratory?

Doctor PARSONS. The Government laboratory, and that would be available to any plant which might be added in plant No. 1. That was discovered by Government employees.

Senator NORBECK. The information I got from one of the engineers was that the failure of the Haber process at Muscle Shoals was due to the fact that they attempted to carry 1,500 pounds of pressure in steel pipes at the same time that they carried a temperature of 1,500 centigrade.

Doctor PARSONS. No; that was around 500°, Senator.

Senator NORBECK. Oh, 1,500 Fahrenheit?

Doctor PARSONS. No; it is 1,500 pounds pressure per square inch and about 500° centigrade.

Senator NORBECK. And they were not able to get pipes that would carry that pressure, with that heat?

Doctor PARSONS. That was one of the difficulties that arose.

Senator NORBECK. Can that particular thing be removed?

Doctor PARSONS. Oh, yes. It has been in all of the plants operating in the world, because they are all working under similar or more difficult conditions.

Senator NORBECK. By the manufacture of pipe that will stand pressure at high heat?

Doctor PARSONS. No.

Senator NORBECK. No such pipe was available at the time of this construction?

Doctor PARSONS. Yes; but they have had to find out these things by trial.

Senator NORBECK. That is practically the same experience that the German people had in building their plant?

Doctor PARSONS. Exactly, and that was the experience at Muscle Shoals in plant No. 1 which had to be closed down at the time of the armistice.

Senator NORBECK. It is your idea that if our people could have kept on for another year, they would have operated that Haber plant successfully at Muscle Shoals?

Doctor PARSONS. That is not only my idea, but that is the idea of everybody that had any connection with the plant.

Senator NORBECK. And in your opinion that would have resulted in a much cheaper output than would have been produced at the other plant?

Doctor PARSONS. Unquestionably.

Senator HEFLIN. What do you think it would cost to put the Haber plant in operating condition at plant No. 1?

Doctor PARSONS. I think, with the material already there at plant No. 1, to bring it up to a 30-ton-per-day capacity—which is the capacity originally estimated—it would cost in the neighborhood of \$2,000,000. I am lower in that figure than are some of the Ordnance people. They may be nearer right than I am, but I have a pretty good basis for my calculations, because I know something about costs in other plants.

Senator HEFLIN. You think, then, that with the expenditure of \$2,000,000 it could be made a perfectly good plant?

Doctor PARSONS. It could be made a perfectly good plant to that extent; yes, sir.

The CHAIRMAN. Then, what would its capacity be?

Doctor PARSONS. Thirty tons of ammonia per day. I am merely talking about the plant itself. There may be other accessories that will have to be put in which will cost more, as was the condition when the original plants were put in down there. Of course, the so-called cost of plant No. 1 was originally estimated at about \$7,000,000,

and it really cost \$13,000,000, but the \$13,000,000 included many things not estimated for in the first estimate, like the ammonium nitrate plant, the oxidation plant, the plant for the concentration of nitric acid, and other things.

Senator NORBECK. And those 85 residences.

Doctor PARSONS. Yes, sir; the residences and the water works and railroad tracks. I am not prepared to say that I should not like to have more than \$2,000,000 available if I were going to undertake the work, but I believe the plan can be carried out and the plant put in operation for that amount.

The CHAIRMAN. Were you there during the construction of plant No. 1?

Doctor PARSONS. Yes, sir. Yes and no. I was there during the whole latter part of the construction of plant No. 1.

The CHAIRMAN. Were you located there?

Doctor PARSONS. Oh, no, I was not located there. I beg your pardon.

The CHAIRMAN. What portion of your time did you spend there? Were you actually engaged in the construction?

Doctor PARSONS. I was not, in any sense at all.

The CHAIRMAN. What was your purpose in going down there?

Doctor PARSONS. I went there as a member of the Nitrates Commission.

Senator NORBECK. If that plant is remodeled at a cost of approximately a couple of million dollars, as you suggest, you are satisfied that, in all probability, it will operate successfully?

Doctor PARSONS. Yes.

Senator NORBECK. In that event, how much cheaper will they produce than will the cyanamide plant which is there?

Doctor PARSONS. I should have to have a number of basic facts to go on to answer that question.

Senator NORBECK. Would you be willing to look that up?

Doctor PARSONS. I can answer your question here, if you will get down to the points, so that it will be correctly answered when I have answered it.

Senator NORBECK. Yes.

Doctor PARSONS. Do you assume that you will use the secondary power to produce your hydrogen, or do you calculate that you are going to use your steam power to produce your hydrogen?

Senator NORBECK. Let us assume that the horsepower cost three-fourths of a mill on the cyanamide process. How much cheaper, if any, do you think you could produce under the Haber process, with the present steam plant, after you have remodeled it, as you suggest?

Doctor PARSONS. I think you could produce ammonia for from 75 to 80 per cent of the price that you could hope to produce it with the cyanamide process.

Senator NORBECK. Even with that very cheap power?

Doctor PARSONS. Yes; even with that very cheap power, from 75 to 80 per cent, and perhaps less. The Ordnance Department and the Nitrogen Fixation Laboratory have estimated that they can produce ammonium sulphate at plant No. 2 on the basis of about \$65 per ton—that is, under commercial conditions—\$65 per ton of ammonium sulphate. Now, I do not think they can; in fact I feel absolutely certain that they can not.

Senator NORBECK. You think it would cost how much?

Doctor PARSONS. At least \$75 and perhaps \$80.

Senator NORBECK. And you think, with the Haber process and with the secondary power, you might produce it at how much?

Doctor PARSONS. Around \$50 a ton. That is, if you operate it by a commercial concern.

Senator NORBECK. May I ask you this question, Doctor? Out of this \$50 or \$60 a ton what part of the expense would be power?

Doctor PARSONS. Again, you must take into consideration whether you are going to use power to produce your hydrogen or coal to produce your hydrogen?

Senator NORBECK. I mean after you have remodeled it at an expense of a couple million dollars, as you said awhile ago.

Doctor PARSONS. If you are going to produce power to produce hydrogen—

Senator NORBECK. Is that what you have implied when you say you would remodel your plant by spending a couple million dollars on it?

Doctor PARSONS. That is the method I should use down there, yes. I am afraid I will have to put that in the record, to be accurate.

Do you know what it is, Major [addressing Major Burns]?

Major BURNS. According to that scheme you would use about 4,000 kilowatts per ton of ammonium sulphate. On the basis of a mill per kilowatt hour, your power cost would be \$4 per ton of ammonium sulphate. On the basis of 4-mill power it would be \$16 per ton.

Doctor PARSONS. I am talking about mill power only.

Major BURNS. Assuming it at \$50 a ton, your power charge would be \$4 and your percentage would be 8 per cent, or 4 divided by 50. That is in round figures.

Doctor PARSONS. You are considering making the hydrogen electrolytically.

Major BURNS. That is what I understood you to say.

Doctor PARSONS. I do not have those figures in my mind. I have had them all calculated out, and I can give them to you exactly.

Senator NORBECK. We are trying to find out how much it will help toward the cheapening of fertilizer.

Doctor PARSONS. The only power at Muscle Shoals that will do any good is that secondary power.

The CHAIRMAN. You would have to do that with the Haber process.

Doctor PARSONS. You would have to do it with the Haber process. In my opinion you can not use secondary power or any other power, even if your power cost you nothing, to run the cyanamid plant and make fertilizer at any cheaper rate than it is to-day. I think you ought to examine quite carefully the various records bearing upon that matter. I think you ought to get the so-called Exhibit B that was introduced in the House hearings, put in by the Ordnance Department, in which they made their estimate of the operation of the cyanamid plant, showing, at the request of Mr. Fields, what the outcome would be in operating that plant for six years.

They estimated that if we should operate that plant for six years, we would lose \$2,919,000, and in order to get that loss they have taken the ammonium sulphate at \$65 a ton. That price for ammonium sulphate is not "cheap fertilizer." Ammonium sulphate in 1921 sold for an average of less than \$50 a ton. It sold for \$40 a ton, and there was a lot of it that was sold in the low thirties. If you take \$50 a ton as the price of ammonium sulphate in plant No. 2, according to the estimate of the Ordnance Department—and, in my opinion, those estimates are low—you would lose in those six years over \$22,000,000 by operating the plant. That is on the basis of secondary power.

Senator NORBECK. And you would not be furnishing cheap fertilizer.

Doctor PARSONS. That is on the basis of \$50 a ton for ammonium sulphate.

Senator NORBECK. That is not a cheap fertilizer?

Doctor PARSONS. It is more than the average price for the last year.

The CHAIRMAN. Now, to get down to a practical solution of that difficulty, it would be your judgment, as I understand it, that plant No. 2 is useful and should be considered and kept as a war proposition, and that the other plant, under the method you have described, should be operated by secondary power. Is that about right?

Doctor PARSONS. That is right; yes, sir.

The CHAIRMAN. If the Government, for instance, retains it?

Doctor PARSONS. But basic to all of that, I want to go very strongly on record by saying that no matter what you would do at that plant, through that power, you are not going to get "cheap fertilizer" for anybody.

Senator HEFLIN. Mr. Ford says he can make cheap fertilizer if we give him that power under the arrangement that he has suggested to the Government.

Doctor PARSONS. It is important, I think, that you should all read very carefully both the House records and the Senate records. Mr. Mayo is unquestionably a most excellent engineer and understands water power and engineering propositions, but he has shown throughout his testimony that they have had nobody that was familiar with fertilizer production advising them at all. His testimony is decidedly varied as given before the House committee and this committee. It has been distinctly changed. In the House committee he stated several times that they would not operate plant No. 2 at all, unless they could operate it at a profit. That is shown to be Ford's statement and the belief also of practically everyone who has studied the situation among the higher officials. For example, Secretary Weeks shows very clearly in his testimony that he does not consider that this offer carries any real assurance in any way that any fertilizer or nitrate will be made.

General Williams says:

"If the Ford offer means, in the case of the No. 2 plant, that such plant will be operated at its approximate capacity for the fixation of nitrogen," etc.

General Beach says:

"Direct benefits accruing to the United States are (b) production in the interest of public welfare of large amounts of fertilizer at a cost not exceeding the reasonable cost of production, providing that the production of nitrates adapted to fertilizer purposes is found to be practicable."

The Secretary of Agriculture in his statement to you was no less noncommittal. The authorized statement given out by Director Tolman favors the Ford offer only "if its terms are sufficiently definite and binding to make sure that the plant will be operated continuously for the manufacture of fertilizer."

Mr. Ford, according to Secretary Weeks, states definitely that plant No. 2 will not be operated unless it can be operated at a profit, and Mr. Mayo definitely confirms this statement in his testimony before the House committee.

Now, as to the question of price, I specially had copied from the record the following, if I may put it in to show where that question of the "one-half price" arose, and to bring out another point which Mr. Mayo, I think, did not bring out in his testimony here, namely, that before the House committee he said that the offer meant they would make 2,000,000 tons of fertilizer. Here he simply spoke of 110,000 tons of ammonium nitrate, and there is a very great difference between the two.

Senator HEFLIN. He testified here that it was Mr. Ford's intention to manufacture fertilizers on a large scale.

Doctor PARSONS. The difficulty in the whole situation is the question of Mr. Ford's intention, but the thing that you want is Mr. Ford's guaranty. I am sorry that Mr. Ford has not himself come here and put himself on record.

Senator HEFLIN. He has modified his proposal somewhat, you know, and states that he agrees to make commercial fertilizers.

Doctor PARSONS. As to the commercial fertilizers, I will bring that out. May I read you this paragraph?

The CHAIRMAN. Yes.

Doctor PARSONS. It is as follows:

"Mr. GARRETT. You stated in answer to a question by some gentleman here this morning that you thought he could make fertilizer 50 per cent cheaper than it is to-day.

"Mr. MAYO. We think so; yes, sir.

"Mr. GARRETT. On what do you base that statement?

"Mr. MAYO. Well, we base that on a number of processes, any one of which we may adopt."

And all through his testimony it has been "any number of processes." They apparently have not any expert advice on the nitrogen situation whatsoever.

Senator. HEFLIN. He claims they have a secret process.

Doctor PARSONS. Yes; he talks about that, and he also says that they have a process of making fertilizer as an adjunct to electric steel and aluminum. That process has been well known for fifteen or twenty years, and if he did not have any process three months ago, I do not think, as he has no nitrogen experts with him, that in three months he has developed anything very wonderful or has brought it out in a way that would give you any basis for accepting it.

Senator. HEFLIN. But, of course, you do not know whether he has or not.

Doctor PARSONS. No; nobody knows anything about it at all; but we do know that the lime slag iron obtained from iron ore which contains phosphate takes the phosphorus out of the iron ore, and this so-called Thomas slag has been used for fertilizer purposes in Europe and in America for a long time. We also know in connection with the manufacture of aluminum, that there has been a process originally devised by Serpek in France, and worked in this country by the Aluminum Co. of America, and which has been abandoned by both after the expenditure of hundreds and hundreds of thousands of dollars, it having been found to be entirely impractical. In my opinion it will always be impractical, on account of the very high heat that has to be used, and various other conditions.

I will go ahead with this testimony now, if I may:

"Mr. GARRETT. You mean that you have in mind processes for the manufacture of fertilizer that have not yet been developed by any of the other companies?

"Mr. MAYO. Yes sir; or partly developed by some of them.

"Mr. GARRETT. What I want to get at is this: Regardless of that, because that is something we do not know about now, but we do know that fertilizer is being made, and how it is being made, and how it is being distributed now.

"Mr. MAYO. Yes, sir.

"Mr. GARRETT. And what I want to get in the record is how much cheaper can Mr. Ford, in your opinion, make fertilizer at this plant if the Government accepts his offer, at the rate of about 2,000,000 tons per year than it is being made generally throughout the country?"

Mr. Mayo at those other hearings testified that 2,000,000 tons of fertilizer was the equivalent of 110,000 tons of ammonium nitrate, simply because the 2,000,000 tons does contain the same amount of nitrogen as the 110,000 tons, forgetting that if you made all of those things by the electrothermal method you would be using more power than Muscle Shoals would supply.

"Mr. MAYO. Of course, we are green at the fertilizer business, and I could not exactly say, but Mr. Washburn in his statement said he thought it could be made there at about one-half the price."

There is the original basic thought upon which all of this one-half price has been based. Mr. Washburn, in his original talk before the House committee, before the war, when he was trying to get Muscle Shoals developed, thought that he could make fertilizer down there for one-half price, and Mr. Mayo simply adopted that statement, and, in my opinion, he has nothing else whatever to go on, for, as I have said before, if you take 2,000,000 tons of fertilizer, and put in it the total amount of nitrogen that is present for nothing, it would not reduce it 33½ per cent.

"Mr. GARRETT. Do you think you would be safe in saying to the committee, as the spokesman of Mr. Ford, that it would be made 33½ per cent cheaper than it is being made and distributed to the farmer now?"

"Mr. MAYO. Yes, sir."

Now, if you could get him to guarantee that 2,000,000 tons of fertilizer a year and a 33½ per cent reduction in price, I am for the Ford offer.

Senator KEYES. In your opinion could that plant No. 2, under this proposal or any other proposal made to this committee, be operated so as to materially reduce the price of fertilizer to the farmers of this country?

Doctor PARSONS. No, sir; I do not.

Senator HEFLIN. Then, you do not think there is any hope for fertilizer users in this country; that it must remain in the hands of the fertilizer trust?

Doctor PARSONS. I do not think there is any fertilizer trust, Senator.

Senator HEFLIN. Don't you?

Doctor PARSONS. I have seen in the last few years the strictest competition between them. I think if you will look into their profits that the stock has been down to almost nothing in all cases, and they have been paying no dividends. As to there being any "trust," I think it is just as much a shibboleth as the question of this "cheap fertilizer." I do not own any fertilizer stock, nor am I interested, directly or indirectly, in any fertilizer company, but I believe that is absolutely true. Now, the more fixed nitrogen you can produce and the more you develop methods for production, the more you decrease the price of fixed nitrogen to the farmer in his fertilizer. I am thoroughly desirous of seeing that accomplished, and I believe it is going to be accomplished, but it is not going to be accomplished through Muscle Shoals or any other power proposition.

Senator HEFLIN. Why, then, do you suppose these commercial fertilizer concerns are fighting the Ford offer, unless they are afraid that he will reduce the price of fertilizer?

Doctor PARSONS. If they think that a man is going to have an immense business given to him on a gold platter with a bonus, they naturally hesitate to have the supply of the country increased by 25 per cent under those conditions, to compete with them immediately, because it would probably be a very serious thing. At least, that is the way it seems to me. Now, when you give that immense power to a person simply on the basis of cheap fertilizer, you are giving one of the biggest subsidies ever given in American history to any one man. I do not care whether it is Mr. Ford or anyone else. Mr. Ford, of course, is a dreamer of dreams, one of which has come true, and Mr. Mayo said that this cheap fertilizer was one of his dreams. In that connection Mr. Mayo has said:

"It is Mr. Ford's dream in regard to this fertilizer product to make the price of it such that anybody can use it in any quantity they wish to; that the expense would not prevent them from using all they should use."

That is a beautiful dream and I hope it will come true, but I maintain it is not coming true through Muscle Shoals.

Senator HEFLIN. You know, some of them claim that they will use 500,000 horsepower in that river at those three dams. What do you think of that?

Doctor PARSONS. Five hundred thousand horsepower?

Senator HEFLIN. Yes.

Senator KEYES. For what purpose?

Senator HEFLIN. For any purpose.

Doctor PARSONS. When they get those dams going—and do not misunderstand me; I am not against the building of those dams to get the power for industrial use, I am for it; but I do not want to see it developed under a false premise. You need those industries in Alabama, you need those industries in Tennessee, and you need those industries in my own home State of Georgia. You need that power for the development of our industries. There is only one great fault, you must remember, and that is that the people down there have the idea that this will bring in thousands of people, as they thought would be the case at Niagara Falls. The actual facts are that when they developed Niagara Falls, taking into consideration the textile industry at Lawrence, they thought they were going to get a city of 3,000,000 inhabitants, and they did not get more than 15,000. Down there, you will not get any more, because it will not require that many people to run it. Electrochemical industries do not mean

people. I want to see the dam completed and the power used all through the South, the same as around New York and other places.

Senator HEFLIN. You do not want to see Mr. Ford's offer accepted, do you?

Doctor PARSONS. I do not believe any such asset as that immense power should be given as a bonus to any American citizen. You should either sell it properly or you should develop it yourselves.

Senator HEFLIN. Well, if he should be able to manufacture cheap fertilizer, it would be a great service to millions of farmers, would it not, if the Government let him have it?

Doctor PARSONS. I think the getting of cheap fertilizer would be a great service to the American farmers; yes, sir; but it is not coming that way.

Senator KENDRICK. I would like to ask you a question right there, Doctor Parsons. Is it your opinion, based on statements you have made, that the Government owning and controlling power and leasing such of it as there may be found a market for, particularly the primary power, and proceeding in its own way to keep one of those plants operating for the production of nitrogen, would be just as apt, even more apt, to reduce the cost involved in the production of nitrates as any private individual or corporation?

Doctor PARSONS. No, Senator; I am not in favor of Government operation of any commercial organization of this kind. If you go into the production of nitrates by the Government it means that you will have to take up the whole fertilizer business, and it means—

Senator KENDRICK. I want to interrupt you there to say that the primary purpose of the whole scheme has been, or that is, it was in its initiation, to provide nitrates for the use of the Government in war time.

Doctor PARSONS. Quite right.

Senator KENDRICK. Now, in order to have an effective and efficient plant for the production of nitrates when war comes, this plant or some other plant must be kept in operation.

Doctor PARSONS. I agree with you very heartily.

Senator KENDRICK. So it would not be entirely a commercial proposition.

Doctor PARSONS. What I personally believe in is that plant No. 2 should be kept in a stand-by condition at a cost of something like \$100,000 a year. It can be ready to operate at a moment's notice, until such time as we have other reserves, so that there will be no need for keeping it. I am of the opinion that the fixation of nitrogen will be developed most rapidly and most efficiently by private competition, and I believe that private competition is in sight. I do not believe that anyone has a monopoly of the fixation of nitrogen in this country, and that it is quite possible, and in fact practically certain, that there will be strong competition in the development of synthetic ammonia processes. The future fixation of nitrogen is going to be through the synthetic processes, although, of course, no one is prepared to state that some wonderful discovery may not be made to-morrow. I do not wish to intimate that we have improved as much as we will ultimately improve it, or to be through, but the use of the synthetic processes is the present outlook. Now, personally, I believe you would get furthest by carrying out exactly the plan I have put in my offer there, that plant No. 1 should be sold, we will say, to the highest bidder, and that the secondary power to operate that plant be in some way furnished.

Senator HEFLIN. So it is possible, then, you say, for the discovery any day of a process that will produce the stuff cheaper than it is produced to-day. Now, Mr. Ford says that he has a secret process by which he will be able to make it much more cheaply than it is made to-day.

Doctor PARSONS. There was a lecture given by Mr. Ashton at the Cosmos Club a few days ago in which he stated that the first man who set free the energy which we know to be present in the atom might, by that very act, set free the energy of all of the atoms and thereby blow the earth into a nebula. I think there is as much probability in one as in the other. I am willing to say that both of them are possible.

Senator HEFLIN. You think it is possible for somebody to discover something to-morrow that will be a much cheaper process than that which you have to-day, yet you think it is impossible for Mr. Ford to get hold of one of those processes.

Doctor PARSONS. I did not say that I thought it was impossible. I said it was just as probable he had developed this wonderful secret process in two months as the other of those two things which I mentioned. I am not denying the possibility of anything.

The CHAIRMAN. Now, Doctor Parsons, I want to get back to where I started out with you when somebody else took you away from me. At that time I had not gotten out what I wanted to get out. You were talking about operating plant No. 1 on

secondary power. Will the secondary power that will be made, say, for 10 months in the year, be more than enough to operate plant No. 1 under your plan?

Doctor PARSONS. That depends entirely on the extent to which plant No. 1 is enlarged. It would be much more—

The CHAIRMAN. I am speaking of it as it stands now.

Doctor PARSONS. It would be much more than enough to operate it as it stands. The actual fact is that with 100,000 secondary power available 10 months of the year, it will give just about the output that No. 2 would give, provided there was the necessary installation at No. 1 to utilize that power for the electrolysis of water.

The CHAIRMAN. Then, it would mean this, that there would be secondary power enough developed at Dam No. 2 to operate the Haber process planned under your plan, with an annual capacity of 40,000 tons of nitrogen?

Doctor PARSONS. You have it absolutely right, Senator. It would be slightly in excess of that.

The CHAIRMAN. That would mean as much as a war proposition as nitrate plant No. 2 could do running to its full capacity, regardless of expense?

Doctor PARSONS. It would mean very much more as a war proposition, simply because you would have an operating plant, a modern commercial plant, and you would have to keep that up to date all the time.

The CHAIRMAN. To do that, how much would you have to increase the capacity of plant No. 1?

Doctor PARSONS. Five times.

The CHAIRMAN. Five times; and how much money would it cost?

Doctor PARSONS. Government built or privately built?

The CHAIRMAN. Well, both ways. Give it to us both ways.

Doctor PARSONS. Well, I should want around \$15,000,000 to \$20,000,000.

Senator NORBECK. For which way?

Doctor PARSONS. Am I going to do it?

Senator NORBECK. Give it to us the private way and the ordinary Government way, so that we can have the comparison. It would be \$30,000,000 Government built, then, would it?

Doctor PARSONS. I do not think I had better make that comparison, Senator. I think that, efficiently done, \$15,000,000 to \$20,000,000 would cover the situation. That is the best way for me to put it.

Senator NORBECK. The chairman and I do not agree on the degree of Government efficiency.

The CHAIRMAN. I want to have it in the most efficient way.

Doctor PARSONS. I think \$20,000,000 would be sufficient.

The CHAIRMAN. Well, you are speaking now of letting it by contract to some private individual, and if you mean that is the efficient way, that is the way I want you to make your estimate.

Doctor PARSONS. No; I would not let it by contract.

The CHAIRMAN. Well, the cheapest way that you could do it and have it good.

Doctor PARSONS. Well, say \$15,000,000.

The CHAIRMAN. All right.

Doctor PARSONS. I would like to have the privilege of placing that figure in the record.

The CHAIRMAN. All right, if you care to. I would like to know the figure.

Doctor PARSONS. But I think that is essentially correct.

The CHAIRMAN. When we reach that point—

Doctor PARSONS. Major Burns said he would put it at \$20,000,000.

The CHAIRMAN. How many years would it take to have that done? It would not take more than a year or two, would it?

Doctor PARSONS. Oh, yes, sir. Nobody ought to go at a matter of that kind at once. It would not be a proper procedure. You ought to build your first 10-ton unit and operate it for six months and then increase to your 30 and operate that for a year and a half, and then go ahead and put in your full construction. Remember, you can not do anything with this until you get your secondary power.

The CHAIRMAN. I am asking you to outline it. It would take three or four years before you would be consuming your secondary power?

Doctor PARSONS. Yes, sir.

The CHAIRMAN. To its maximum, at that one dam. Now, in the meantime, you would have a lot of secondary power to sell if you could find a market for it, under your plan?

Doctor PARSONS. There is very little market for secondary power there.

The CHAIRMAN. That is true, unless it is something that it is peculiarly situated, so that the people need the power.

Doctor PARSONS. That is why I put in the lease. I hoped I might use it for the phosphoric acid and carbide.

The CHAIRMAN. During that time you would be able to sell 87,300 horsepower.

Doctor PARSONS. Oh, if you owned the primary power and there was a market for it.

The CHAIRMAN. Yes.

Doctor PARSONS. But that does not come in a minute.

The CHAIRMAN. Oh, no; I understand that.

Dr. PARSONS. Even then you might not get all of your market for all of your primary at once in the best way.

If you will allow me to add one other thing on the question of operation, you can not hope to do this efficiently and get the right people to handle it for any such salaries as you have put in your bill.

The CHAIRMAN. I am going to take up that feature of it with you later, but right now I am speaking of something else. I want to get your ideas in the record and not mine.

Doctor PARSONS. Yes, sir.

The CHAIRMAN. When that time comes, at the end of three or four years, with plant No. 1 operating to its capacity, we can scrap plant No. 2, even as a war proposition?

Doctor PARSONS. Quite right.

The CHAIRMAN. What would be its value?

Doctor PARSONS. But you have a very valuable steam plant in plant No. 2.

The CHAIRMAN. And we would probably retain that to operate.

Doctor PARSONS. I should also want in plant No. 2, if it could be obtained, the Claude nitrogen plant. It is not in the other plant.

The CHAIRMAN. Then, we would also sell the Waco quarry, would we not, and all that machinery?

Doctor PARSONS. Yes, sir.

The CHAIRMAN. In the meantime, if we carried out the plan that everybody seems to want to carry out, we would have built Dam No. 3, and then we would have a whole lot more primary power—40,000—and a whole lot more secondary. What would you do with that?

Doctor PARSONS. Sell it.

Senator KEYES. Sell it to Mr. Ford?

Dr. PARSONS. Sell it to the highest bidder. If the Government is to do it it should sell it to the citizens around there—sell it to the man who would give the most money for it, and put it on short-time contracts, so that they will not have it indefinitely.

The CHAIRMAN. I am trying to get at a picture that will be true when the thing is completed and running and that Dam No. 2 is a part of the improvement that everybody contemplates eventually putting in, and we do not want to stop there.

Doctor PARSONS. If you would like to know what I think should be done—

The CHAIRMAN. That is what I want.

Doctor PARSONS. I have no hesitancy in giving it to you.

The CHAIRMAN. That is what I would like to have.

Doctor PARSONS. I think plant No. 2 should be kept in stand-by condition, until the possible emergency is past, as you suggested. I think plant No. 1 should be developed by private parties to whom the secondary horsepower is sold. I think when that is accomplished the Waco quarries should be sold to the highest bidder. I think the Warrior River extension of the Alabama Power Co. should be settled with the Alabama Power Co. under the contracts which have been made as a separate entity, so that the Government may carry out what I believe to be both its legal and moral obligations. That leaves you, then, simply the dams. Now, if you can get an offer that is good enough for the development of those dams under proper safeguards to the people, I believe in having those developed and operated by private parties, and they should go to the highest bidder. If you can not, I think the Government should go ahead and build them and sell the power itself, because I think that that immense natural resource of the South should be developed and used in some way.

The CHAIRMAN. Have you investigated the reservoir proposition? That is what I was leading up to.

Doctor PARSONS. I have not investigated it personally. It is not in my line of endeavor. I do not wish to give testimony on anything I do not think that I am perfectly qualified to speak on. I have, of course, followed all of the testimony which was given and have been very much interested in it, and I do not doubt that there is a very large water power, and that a distinct reserve of water can be developed on the Tennessee and its tributaries, but the details are for others, like Colonel Cooper, to speak of.

The CHAIRMAN. That would mean that the secondary power would be decreased and the primary power increased at whatever dams you might have them.

Doctor PARSONS. They would both be increased, but they would be increased by a greater proportion to the primary power.

The CHAIRMAN. Now, Doctor, I wish you would—

Senator KENDRICK. Mr. Chairman, there is just one question I would like to ask before the doctor leaves that subject.

The CHAIRMAN. All right; go ahead, Senator.

Senator KENDRICK. I want to ask a question in connection with your statement that you thought this plant No. 2 should be kept in stand-by condition until the emergency had completely passed. Is it your opinion that the plants should be maintained with the same degree of efficiency standing idle as if they were kept in operation?

Doctor PARSONS. Yes, sir; this is a peculiar plant in that way, Senator Kendrick. It is a plant which is made up quite largely of materials which do not readily deteriorate; that is, it is brick and stone and cement and mortar and copper wire, copper leads, and it has these electric furnaces, the chief parts of which are made of fire brick. There is very little machinery that normally oxidizes in the air or that goes to pieces. This plant can be kept in stand-by condition for a very long time, especially that portion of it which you would have any thought of operating. It is quite possible that the ammonium nitrate plant would be a little more difficult to keep in shape, but even that could be kept in shape easily, because it is quite largely enameled iron-ware. The ammonium oxidation plant is largely brick and mortar. The ammonium oxidation plant has, in my opinion, already been superseded, and I do not think will be used long in any case, but so far as the cyanamid plant is concerned, the portion of it which will be operated for fertilizers could with very slight expense be kept in very excellent condition for a great number of years.

Senator KEYES. Did you not state something in your testimony about \$100,000 being the sum necessary?

Doctor PARSONS. \$100,000 or less, I think, is the actual experience of the Ordnance Department in the last year or two.

The CHAIRMAN. Doctor, let us go back again to where I was. You said something about the salaries provided for, and I suppose you were referring to the bill that I have introduced.

Doctor PARSONS. Yes, sir.

The CHAIRMAN. It was not my idea, Doctor, in providing that the salaries should be fixed at \$7,500 annually, that we should employ chemists, or anything of that kind. Is it your idea, if that method were adopted, that the board ought to consist of men of that kind who are especially educated in scientific lines?

Doctor PARSONS. I think that on a board of three men, as you have it there, there should be at least one of them who is thoroughly technically educated along these lines, and that the others should be business men of vision and of successful experience. I do not believe you can get any such men, either the technical men or the business men, who would give up their time to a proposition of that kind for less than three or four times the salary per individual that you have provided for there. I know that any industrial corporation in a proposition of this kind would pick the best men that they could find in the country, and in order to get them, would pay those salaries, and I know that the best man is the cheapest, irrespective of what you pay him.

The CHAIRMAN. You may be entirely right about that, Doctor, and I do not want to criticize your position at all, because I think your position is the one that probably would be sustained by most people; but my idea was that on the board who would operate this proposition you would not necessarily have chemists or engineers. In fact, if I were selecting those men, I do not believe that I would select any one of them because of the fact that he was a chemist or an engineer, but I would select, rather, broad-minded business men, and they would employ such chemists and such engineers as they needed. For instance, if I were selecting them and I could get a man like Mr. Ford, I think I would pick him as one of the men to handle this great concern, although he is neither an engineer nor a chemist, and I believe that I would be competent myself to handle that thing, although I am only getting \$7,500 a year, and I can not save nearly as much out of that salary as I could if I were handling that job.

Doctor PARSONS. I know, for I worked for the United States Government eight years of my life. You are doing it the same as I did, solely for the personal satisfaction of accomplishment.

The CHAIRMAN. Yes, sir; yes, sir.

Doctor PARSONS. Nothing else.

The CHAIRMAN. Now, could you not get those men and give them this life job?

Doctor PARSONS. No; that is a commercial business.

Senator NORBECK. The marble halls are missing; is that it?

Doctor PARSONS. Government service has both its advantages and disadvantages. It seems to me sometimes as if the men who were doing the best work in some of the departments are the ones who are blamed and received the most criticism.

The CHAIRMAN. Yes; and lots of times it is the fellow who is getting the lowest salary who gets the blame.

Doctor PARSONS. Yes; take an investigation such as Colonel Joyce has had to go through with. There never was a more honorable, hard-working and straightforward man than he. It would have killed me to have gone through that, but he seems to have gotten through all right. I suppose these Army officers get used to being "bawled out" all the time.

The CHAIRMAN. They do not get bawled out half as much as Senators and Congressmen.

Senator NORBECK. But we can bawl back.

Doctor PARSONS. But the satisfaction of accomplishment is the only emolument that you can get from the Government service.

The CHAIRMAN. After all, speaking of the thing in a broad way, especially in a position that is going to last for life, the man who would take one of these positions for the dollars and cents that could be obtained as a rule would not, in my judgment, be as good as the man who would take it because he wants to accomplish something for his fellow men or for his country.

Doctor PARSONS. Well, I put in eight years of that kind of service. I was happy while I did it, but I had a family and I had to go out and make a living for them.

The CHAIRMAN. Well, Doctor, a man having this position down there would have a house to live in if he wanted to live down there, and he could support a family and do it well on \$7,500 a year.

Doctor PARSONS. But that same man, the kind of man you ought to have, could lay up a competency for each one of his children, to start them out with afterwards. If you could find three bachelors or three married men with no children, it might be all right.

The CHAIRMAN. Another thing I have noticed in the various bills we have passed providing for salaries for things similar to this, there has grown up in Congress, especially in the Senate, a feeling—I have heard many Senators say so—that we should not vote for any salary for a member of a commission similar to this greater than the salary that the Members of Congress themselves were getting.

Doctor PARSONS. It is very difficult to get men of that kind appointed who are the best men for Government positions. Although you may put in all of the safeguards against politics that you choose, it is very difficult to actually accomplish the fact. I want to say this one thing, that if this plant is run by the Government you should follow the same methods as are followed by commercial organizations. Get the best man because he is the best man; get him because you have to have him to succeed; because he is the best man, and pay him what he is worth.

The CHAIRMAN. Is not that provided for in this measure?

Doctor PARSONS. Not a bit of it. You have tried to provide for it; the whole thought is through there, Senator Norris. I have no criticism to make; I have sympathy with your difficulties, but I do not believe—

The CHAIRMAN. The Government has difficulty in getting it out of politics; it is not its fault, I concede that, and I think that is the reason why so many people believe it will be a failure, because it is compared with government operations that have been a failure where politics had not been kept out. I would like to have suggestions from any source to improve it, with that in view, to keep it out of politics, if the thing can be done. Now, nobody charges that there is any politics in the Supreme Court of the United States.

Doctor PARSONS. No.

The CHAIRMAN. I have never heard of such a charge having been made by anyone.

Doctor PARSONS. I do not think anybody makes that charge.

The CHAIRMAN. There have been other charges made against them, but I have never heard that charge made.

Doctor PARSONS. No.

The CHAIRMAN. And I have been desirous in this bill to surround this board in the same way that the Supreme Court is surrounded, by safeguards to keep it out of politics, and I think this board is even more safeguarded.

Doctor PARSONS. But the Supreme Court is the highest honor that can come to an American citizen outside of the Presidency of the United States.

The CHAIRMAN. It is a very high honor to be a member of this commission, according to my idea.

Doctor PARSONS. I doubt if it would be so regarded. There are plenty of commercial openings. There are plenty of commercial opportunities of a similar nature that are available, and most men find that they can do their best work in matters of that kind outside of the Government rather than in the Government.

The CHAIRMAN. What do you think the salary should be, for the members of this board? Of course, if that item is not correct, that is something that I would be very glad to have remedied?

Doctor PARSONS. I do not believe you want a board of that kind, that is going to give up its time to it. I think you should have especially a president, and general manager and a board of directors. The board of directors would give just the same amount of time that ordinarily business men would give as directors. None of them give their full time to it. I think your president and general manager should be the best men possible to get, and they should be on a regular commercial basis. Their salaries should certainly be as high as \$25,000.

The CHAIRMAN. For the members of the board?

Doctor PARSONS. No.

The CHAIRMAN. For the president and general manager

Doctor PARSONS. For the man who was the real controlling man. I am one of those who believe that if you can get the right man you do not need two other men to tell him how to run it. You simply need the other men to safeguard the situation, to see how it is run and look over it from time to time, like your board of directors.

Senator NORBECK. Would it not be better to have the board of directors select that man, and they would select the right man out of their experience?

Doctor PARSONS. Yes.

Senator NORBECK. I think so.

Doctor PARSONS. You are quite correct. That is what the board of directors should do, and they should be very careful in picking out the man who is to put it through.

The CHAIRMAN. Under this bill would they not have the right to select the general manager?

Doctor PARSONS. Why, they can select any officials they need, with the salary limited to \$12,000.

The CHAIRMAN. Yes.

Doctor PARSONS. But a board of that kind should not be required to give up all of their time to it. They are not the men to direct it, but they will simply guard the direction of it by the man whom they appoint.

The CHAIRMAN. But in order to have this dream, as you might call it, come true, of utilizing completely the waterpower of the Tennessee River, the thought I had in mind was that these three men should supervise it and see just what should be done there and what could be done there and then select the necessary men who had the experience, to build it.

Doctor PARSONS. You are asking me a different question from what I had in mind. I do not know whether I care to pass upon it. I was talking about the nitrogen fixation situation.

The CHAIRMAN. That is only one of the questions I have in mind here.

Doctor PARSONS. So far as the nitrogen fixation situation is concerned, I think you ought to have a board which will have chiefly authority to hire and fire.

The CHAIRMAN. This board already has that authority.

Doctor PARSONS. And simply to sustain or not sustain the man who does have the direction of it.

The CHAIRMAN. My own idea was that this board should select some one man to take care of the nitrate proposition, some man to take care of the engineering and look after the water proposition, etc., and another man of commercial experience to look after the profitable sale of the products; so I am of the opinion that these three men would be busy all the time, and if they are not busy all the time, if they do that work, I would want to keep them out of any other business, so that they may have their minds on this. As you know, Doctor, a man who may be working automatically here in this room, who has his mind on something else a hundred miles away, is not doing good work here.

Doctor PARSONS. That is perfectly true.

The CHAIRMAN. If he is mixed up in a lot of private lines of business, he necessarily gives those lines of business his attention, and he thinks about them no matter where he is, as he ought to, and he would not be giving his best efforts to this corporation at Muscle Shoals. That is the reason I want to prevent his having any other business, so that he could get his mind and heart and soul into the work. Perhaps it is a serious mistake not to pay him more money.

Now, I want to ask you another question, Doctor. We have had something said here, and I think it was stated by Mr. Mayo, in regard to a process that you have not mentioned, the Casale process. Do you know anything about that?

Doctor PARSONS. Yes, sir.

The CHAIRMAN. Have you investigated that in any way?

Doctor PARSONS. As much as one can without being told all about it by Casale. Did Mr. Mayo mention the Casale process?

The CHAIRMAN. Well, somebody did.

Doctor PARSONS. Or was it Mr. Worthington?

The CHAIRMAN. Yes, sir; it was Mr. Worthington. What is the Casale process?

Doctor PARSONS. You understand that what I say is on record and goes most everywhere, and I have to speak rather carefully about things of that kind.

There have been in practically all civilized countries a number of small inventors who have tried to make certain modifications for the fixation of nitrogen by the synthetic ammonia process. Casale is a chemist in the employ of the Idros Co. at Terni, Italy, who has simply been trying to find a different catalyst for the fixation of nitrogen and hydrogen, exactly the same as the Haber process. He has been trying to get a modification, and he has taken out one or two patents for a minor apparatus. The chief owner of the process, Mr. Lepreste, has been on this side trying to raise the necessary capital. He has had a chemist over there with him for the last two or three years. One or two friends of mine have gone over and investigated the property. I have talked with Lepreste and the chemists who have visited the property, and all I can say is that it is just like many other similar trials in various parts of the world, and nobody who has looked into it has put in any money, so far as I know. I certainly would not want to put a cent in it myself.

We have in this country a small operation of this kind by a nitrogen fixation company up at Providence which is able to fix nitrogen and hydrogen. In fact, anyone with a reasonable degree of intelligence at the present time, if you can give them pure nitrogen and pure hydrogen, will not have any great difficulty in rigging up a little plant that will fix a hundred pounds a day. I think Casale at present has not made more than a hundred kilos a day, while they have made two or three hundred at this plant up at Providence.

So far as this process is concerned, you can absolutely forget it. He has used the same thing Claude has used, electrolytic hydrogen, which is a waste product from a chlorine plant at Terni. Now, if you can get hydrogen for nothing as a waste product, of course your cost is going to be low, and when he gave these costs to these chemists, etc., he was getting his hydrogen for nothing. If you can give me hydrogen for nothing I will be a multimillionaire in a short time without any Government help. We have in this country, scattered throughout the country, several chlorine plants. At Niagara Falls there is enough hydrogen to make something like 10 tons of ammonia per day. It is a by-product that until recently has been going to waste. In the production of hydrochloric acid one plant at Wyandotte, Mich., at the present time, when fully operating, makes enough hydrogen to make 5 or 6 tons of ammonia per day. Of course, they have that waste from the chlorine production. It is not possible to use it. If you want to go further and get more production you can not sell your chief products—chlorine and caustic soda. As long as anybody has the by-product to throw away, as they have in several places—such as at Terni, Italy, and as at one or two places in Switzerland—they can make ammonia on a small scale. But that is just a bagatelle.

The CHAIRMAN. Is it not possible to develop this process so that they can manufacture it on a large scale?

Doctor PARSONS. This process has no essential difference. All of these processes that I have spoken of are modifications of the Haber process. So is the Casale process. The Claude process, another, is much better. Claude is one of the best engineers in the world. He has developed pressure apparatus that no one else has been able to develop. The General Chemical Co.'s method is far superior. As far as Casale is concerned I do not think any commercial company at the present time is seriously considering putting in his process on a large scale. It is the Haber process eventually; it is nothing in the world but the Haber process modified with certain apparatus which Casale has been working on.

Senator HEFLIN. You know, it frequently happens that when a man discovers a new process those who have the old processes fight him.

Doctor PARSONS. But this is not a new process.

Senator HEFLIN. Unless they can get hold of the new process themselves.

Doctor PARSONS. But this is not a new process.

Senator HEFLIN. They do not like to have him bring in a new process, because they would have to do it with their old process or put his into use.

Doctor PARSONS. This is not a new process. I think I am in touch with pretty nearly all of the developments that have been or are being made in the world to-day in fixing nitrogen. I have made several trips to Europe, and they have offered to take me through that plant any time I came to Terni, but I have not yet been to see it.

Senator HEFLIN: You know, when the Wright brothers started to make an airplane heavier than air fly with a couple of men in it they were laughed at. But I saw them when they broke the world's record out here at Fort Meyer and were in the air for an hour and 20 minutes.

Doctor PARSONS. That was a different situation there. Merely a change in the propeller of an airplane.

Senator HEFLIN. Is it not a fact, Doctor, that in this realm nobody knows what will be accomplished or what can be accomplished?

Doctor PARSONS. I have said that I would not deny anything in the way of possibilities.

Senator HEFLIN. You know, in the old days, when they treated diphtheria by giving medicine and putting poultices on the throat of the child or whoever was afflicted with the disease, they could not cure the disease, the patient would choke to death; but finally a man invented a serum, and he said that if they would permit him to inject that serum into the blood that he would cure the disease. All of the old doctors said he was crazy and they did not want to use it, but the father and mother of the child consented when he told them that he could not save the child under his old process, and he used his serum and he saved the child. Now, millions of children are being saved by that serum. I think we have the same situation in regard to fixing nitrogen, that all of the processes that we have now will be improved, and fertilizers will be made much more cheaply. If such is not the case, then the farmers are in a helpless situation.

Doctor PARSONS. I believe so, and I hope they will be improved, and I am thoroughly in favor of carrying on researches in nitrogen fixation, but while doing it I think it should be done intelligently, and I do not think every fly-by-night scheme should be accepted immediately as having successful prospects.

Senator HEFLIN. If Mr. Ford is willing to invest his money in the project at Muscle Shoals and contracts with the Government that he is willing to do it, and this is only his offer stating what he is willing to do, the contract has not yet been written, and when it is we can put a clause in there bringing him specifically to produce commercial fertilizers at Muscle Shoals. He does not say that that is all he will do there. Perhaps he will use some of that power for other purposes, but if he is willing to spend his money and go into the matter of making fertilizer at Muscle Shoals, does it not show that he thinks he has a process by which he can compete with those who make commercial fertilizers?

Doctor PARSONS. I do not think it shows anything of the kind. I think it shows he wants the water power there, and he is using cheap fertilizer as the means of getting it.

You will be giving him a tremendous advantage, and there are many people or corporations in the United States, equally financially responsible, with Mr. Ford, who, if they had the opportunity, would jump at it as quickly as a trout to the fly in spring streams.

Senator HEFLIN. But the fact that he is willing to go there and undertake this and bind himself to do this would indicate that he has got a secret process, as I understand he claims to have, by which he can make fertilizer for half the price that it is being made at to-day, for the benefit of the farmer.

Doctor PARSONS. I have never yet seen anything that would indicate that he is willing to bind himself to make 2,000,000 tons of fertilizer per year, as Mr. Mayo states there, and if he is prepared to make 2,000,000 tons of mixed fertilizer per year and reduce the price one-half, using Muscle Shoals for that purpose, I have no objection to giving it to Ford, because I think there is no other man in America who will do it, but I do not think you can get that contract out of Ford or anybody else.

Senator HEFLIN. Well, if he is willing to sign the contract after we accept his offer, and if he is prepared to contract to do what he says in his offer he will do, then the Government will not be to blame for his failure to accept it; but here is the proposition as I see it now: We are going to accept the Ford offer or nothing. That project is going to lie there, in my judgment, and I think there are a good many power companies and fertilizer companies who would be glad to see the Government let it stand there undeveloped for a period, and then later on to buy it just for a song. I think that is the situation.

Senator KEYES. Ford is not paying anything for it, is he?

Senator HEFLIN. Well, probably not as much as we would actually get for it, but what he has offered there, it seems to me, is the best offer in sight. I would like to see the best business transaction possible for the Government, so far as that is concerned, but the way it occurs to me is that we are up against a proposition here, laid down by a man of wonderful genius, a man who has made a marvelous success in the world himself, and he says that there are great possibilities at Muscle Shoals, that he can take the water power there and can harness that water power and produce fertilizers

very cheaply; that he proposes to build an industrial city there, that he will spend a great deal of money in doing it, and if he does that, that would benefit many thousands of people, and if he can produce the fertilizers at half the cost, as he thinks he can, it would be a great blessing to thousands of American farmers.

Doctor PARSONS. I do not deny that if you can get a fertilizer for half price, it would be a great blessing, but I do not believe there is any committee in Congress or Congress itself that would consider the Ford offer from any other man than Ford for five minutes.

Senator HEFLIN. You do not believe they would consider it?

Doctor PARSONS. No; not from any other man but Ford, and I can not conceive how they would even consider it from Ford.

Senator HEFLIN. But do you not think that his offer is the best offer we have now?

Doctor PARSONS. No, sir.

Senator HEFLIN. You do not think it is as good an offer as yours?

Doctor PARSONS. My offer has nothing to do with the Muscle Shoals, especially.

Senator HEFLIN. Yes.

Doctor PARSONS. I can not compare them. I think the Alabama Power Co.'s offer, although I have no interest in the Alabama Power Co., is far superior to Ford's offer.

Senator HEFLIN. You do?

Doctor PARSONS. Yes, sir. They offer to build the dam and give you 100,000 horsepower for nothing. I will give you some figures on that which I think ought to be before you. The Alabama Power Co.'s offer is to build the dam without the expenditure of a cent, as I understand it, on the part of the Government, and to give you 100,000 horsepower of secondary power for nothing. If the secondary horsepower is sold by you for three-quarters of a mill per kilowatt hour, which is the price that everybody has used to base their estimates on in their operation there, you would get \$657,000 cash per year. If you take that \$657,000 cash per year, to be paid one-half semiannually, and put it out at compound interest for 94 years, as Mr. Ford proposed to do with the \$40,000 which he is to pay in as an amortization sinking fund, that \$657,000 at the end of 94 years would amount to \$676,572,030, while the other amount which Mr. Ford is to pay in would amount to only approximately \$40,000,000. If you take that at 5 per cent interest, at the end of 94 years, and these payments are absolutely parallel, because they are cash payments, at a definite time, it would amount to over \$1,200,000,000.

Now, I do not want you to think for a moment that I am assuming that the United States Government is going to take its money and put it out at compound interest at 4 per cent for 94 years, whether it comes from Mr. Ford or from the sale of power with the Alabama Power Co., but I say these figures are absolutely comparable, and you should take them into consideration.

The CHAIRMAN. It is about 1 o'clock now. Have you anything further to state, Doctor?

Doctor PARSONS. No, sir; unless you wish to ask some further questions.

The CHAIRMAN. There is no witness for this afternoon, so we will adjourn until to-morrow morning at 10.30 o'clock.

(Whereupon, at 1 o'clock p. m., the committee adjourned until to-morrow, Tuesday, May 9, 1922, at 10.30 o'clock a. m.)

MUSCLE SHOALS.

TUESDAY, MAY 9, 1922.

UNITED STATES SENATE,
COMMITTEE ON AGRICULTURE AND FORESTRY,
Washington, D. C.

The committee met, pursuant to adjournment, at 10.30 o'clock a. m. in the hearing room of the Committee on Commerce, United States Capitol, Senator George W. Norris presiding.

Present: Senators Norris (chairman), McKinley, Capper, Keyes, Ladd, Norbeck, Harrel, Kendrick, Harrison, Heflin, and Caraway.

The CHAIRMAN. The committee will come to order, and we will hear Mr. McClellan.

STATEMENT OF MR. WILLIAM McCLELLAN, PRESIDENT OF McCLELLAN & JUNKERSFELD (INC.), ENGINEERS AND CONSTRUCTORS, NEW YORK CITY; ALSO PRESIDENT AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS, AND MEMBER EXECUTIVE BOARD OF THE AMERICAN ENGINEERING COUNCIL.

Mr. McCLELLAN. I am William McClellan, president of McClellan & Junkersfeld (Inc.), an engineering and construction organization in New York City; president of the American Institute of Electrical Engineers, and member of the executive board of the American Engineering Council, which, perhaps, it is well to say, is the executive body of the Federated American Engineering Societies, including all of the great engineering societies of the country.

The CHAIRMAN. How old are you, Mr. McClellan?

Mr. McCLELLAN. I am 49.

The CHAIRMAN. For the record, I wish you would tell us where you were educated and what business you have been engaged in since you have been out of school up to the present time.

Mr. McCLELLAN. I was educated at the University of Pennsylvania, with the degrees of Bachelor of Science, Doctor of Philosophy, and Electric Engineer. I was engineer in charge of construction for the Philadelphia Rapid Transit Co. Later I was one of the managing engineers of Westinghouse, Church, Kerr & Co. Later on I was chief engineer, and also chief of the division of light, heat, and power of the Upstate Public Service Commission of New York, and since 1907 I have been in the general business of consulting engineer, first as McClellan & Campion, and later in construction engineering work with Colonel Junkersfeld, under the name of McClellan & Junkersfeld, doing all sorts of engineering construction work. For a time I served the University of Pennsylvania as dean of the Wharton School of Finance and Commerce.

The CHAIRMAN. And what particular work are you doing now, Mr. McClellan?

Mr. McCLELLAN. Just at present the largest piece of work we have, in addition to a lot of report work, is the building of a large steam power house on the Mississippi River for the Union Electric Light & Power Co. of St. Louis. We are also very much interested in several railroad electrification projects and work of that sort. Our business is large construction work.

The CHAIRMAN. Have you made a study of the Muscle Shoals proposition?

Mr. McCLELLAN. No, sir; I have not made a technical study of the Muscle Shoals proposition, and I have not come here this morning to talk of any of the technical features, but if I may go on—

The CHAIRMAN. Yes; we will be very glad to have you go on in your own way now and give us all the information you have.

Mr. McCLELLAN. Yes. As president of the Institute of Electrical Engineers and member of the American Engineering Council, the question of Muscle Shoals has been a subject of active discussion many times. I have also had other opportunities for talking it over with prominent engineers and business men of the country, not

only when it was active as a war project but also since the problem has come up as to what to do with it, now that the immediate war needs are past.

I suppose it will be understood that the busiest, most active, and in many respects the most competent engineers of the country would not take up a study of Muscle Shoals unless they were called upon to do it for some special reason more or less in connection with their own business. I find that to be true. I myself know very little of Muscle Shoals except from the reports that I have seen of it in the newspapers and reports of these hearings and other discussions.

The CHAIRMAN. Have you studied the various bids that have been made in regard to it?

Mr. McCLELLAN. I have merely read them, but I have not studied them in detail and I come here this morning not so much to discuss those bids as to suggest to the committee what my general observation and experience would lead me to believe was probably the best thing that you could do under the circumstances. I believe that your committees—this committee and the House committee—have probably had before you a huge amount of information on this project, much of which is ex parte, not by any means dishonest because it is ex parte, but it is ex parte. It is looked at from the general standpoint of someone who wants to do something, and that purpose may be the most honest purpose in the world. I am not challenging that at all. Nevertheless, I think that the Government of the United States has not had it looked at yet solely from its own interest, unless you put the work of the Army Engineers in that class; but I must go on to say that even then this project is not a technical engineering project. In my opinion it is a business and commercial project at first.

Now, I grant you that the United States Army has in its engineering branches probably as able engineers as you will find in the civil ranks, but this being largely a business and commercial proposition, it can only be decided, I think, by men who have had wide business experience. For that reason, it seems to me, that we must approach it from a little different angle.

My proposition is, first of all, that this committee, either your own alone or in connection with the House committee, should invite a group, say, of five engineers, carefully selected not only because of technical experience they have had, but because of business experience they have had, to review this proposition, and recommend to this committee or these committees the ultimate disposition which should be made of Muscle Shoals.

Now, this is not a new proposition that the Government faces, except as a Government matter. The large corporations of the country have very frequently bought properties, they have merged those properties, costing millions of dollars, and the boards of directors and their officers have been faced with the necessity of making a decision as to whether some of those properties should be rehabilitated and made more efficient, or whether they should be scrapped; and it is not an uncommon thing for a private corporation to decide to scrap a valuable plant, to use it no longer, in the interest of economy.

In the same way here I concede that there are a half a dozen different solutions which might be proper in this case. In fact a great many of them have been proposed. It is conceivable that the Government should take the position that it be paid for what has been done there, in whole or in part, and thereafter have no further relation to it. It is conceivable that the Government should go on and spend money up to a certain point on some definitely decided upon plan as to where it should stop. It is conceivable that the Government should finish it completely and rent it. There are lots of dispositions that could be made of it.

It seems to me it is not only a technical matter, but it is largely a business matter, and so I make that recommendation very strongly to this committee.

Now, I am not asking the Government to appoint a salaried commission to work out the Muscle Shoals project at all. I am proposing that the Government invite a group of engineers in this country to make a general proposal as to what should be done, not to do any technical designing or anything of that sort, but take the matter that is already in existence, review it and suggest to the Government the best business basis on which this project could be worked out. After that time, have the problem put up to the Army engineers, the Government engineers, or a private group of engineers, or what not, to work out the actual design and detail of it.

I will personally engage now, if this committee should issue such an invitation, either as president of the American Institute, or as member of the American Engineering Council, to offer to this committee a group of men who would serve without pay for their time. I mean merely to review the evidence and to suggest to this committee the very best disposition which could be made of Muscle Shoals. That group of men, as I have said before, would have to be men of technical attainment and also of business experience, men who are rushed in their profession and who are so busy

at other things to start in to study this project with no purpose whatever, except, perhaps, to be informed in regard to it. They are men who, of course, if asked to do it for private interests, would only do it for pay. They are men, however, that I am quite sure, on the invitation of the United States Government, would be very glad to do this preliminary thrashing out and make recommendations.

Of course, if that plan is accepted the problem is not solved. The question then comes up as to what is to be done in the meantime, and that presents some very serious problems. I can only speak of that generally, because I have not visited Muscle Shoals, and therefore I am not in a position to speak of it in detail; nor have I studied in great detail the costs of the various plans. But I do know that a large amount of money has been spent there. I do know that it is possible that it could deteriorate, and the first thing that would occur to me is to follow the usual plan of commercial corporations, that when work is interrupted for any reason, they spend whatever money is necessary to protect that work and to keep it from deteriorating.

A further proposition has been made—I have seen it in the papers, I think—that the Government go ahead and spend some millions of dollars to make it rentable. That is the expression that has been used, to sort of, so to speak, finish a certain portion of the project, so that those interested in using it would find it, to use the analogy of a house, put in good order.

My only answer to that is that I think it is a very reasonable proposition in many ways, and to use again the analogy of a house which is to be rented, we all know that if one owns a house down here in the Avenue, and he wants to rent it, it had better be put in a presentable condition. That is true. Perhaps it ought to be renovated as a dwelling; perhaps the front ought to be torn out and the building turned into a store, or perhaps it is not worth spending money on it.

Therefore, I still contend that before we spend money to make a thing rentable unless it is absolutely necessary to keep it from deteriorating, we had far better find out whether the thing is rentable, whether after we have spent the money it really is a project which would be taken up.

Now, let me say that so far as my own fundamental position is concerned, I believe the Government of the United States can very well afford to make streams like this navigable, if competent authority decides that it is advisable. It can very well afford to spend the money on many streams which have power on them in making them flow more uniformly by putting pondage at the heads of the waters, and things of that sort. I am not at all opposed to that. I think there is a great deal of work of that sort that can be done. I have always been opposed to the Government going into the commercial side of the matter, but that is another question that is not under discussion here. So that primarily I am not disposed to stand in the way of spending from seven to ten million dollars to complete any dam or anything of that sort to make it more rentable. I am only raising the question that unless it is absolutely necessary to do that at once, unless there is something about the proposition which makes it rather peremptory, then I think we could very well afford to first find out what is going to be done with the thing afterwards before that money is spent. Secondly, in regard to nitrate plants, that is another question that comes up pending the final decision of what is to be done with Muscle Shoals.

Frankly, I do not think the Government ought to, under any circumstances, alienate these nitrate plants until it has some better project for nitrate plants. In other words, those plants should be held. If necessary, they should be completed, and if this committee of engineers and business men that I am talking about were to agree with that is the best place in the country to have nitrate plants, that that is the advisable place for the Government to have its nitrate plants that it can call on for protection in time of war, then I think those should be completed. But, in my opinion, I do not think they should be alienated. I do not think we ought to let go of them until we are assured that we have no other use for them, and that we are going to have nitrate plants somewhere else.

The CHAIRMAN. Now, Mr. McClellan—

Mr. McCLELLAN. That, in brief, is my general position.

The CHAIRMAN. First, I want to ask you a few questions about the immediate thing, whether we ought to spend any money and go on with the work of the dam or not. The Government has two nitrate plants there, as you know.

Mr. McCLELLAN. Yes.

The CHAIRMAN. Both of them completed.

Mr. McCLELLAN. Yes.

The CHAIRMAN. One of them, however, the small one, nitrate plant No. 1, will have to be remodeled.

Mr. McCLELLAN. Yes.

The CHAIRMAN. That is a small plant as compared to the other one?

Mr. McCLELLAN. Yes.

The CHAIRMAN. And there is no reason why the Government should commence to rehabilitate that plant to-morrow or next year or any other time; it is in good shape.

Mr. McCLELLAN. My proposition is we should not let go of anything—that we ought to hold tight to it.

The CHAIRMAN. Plant No. 2 is complete in every way and the Government could commence to make nitrates there to-morrow, because it has steam power sufficient to run it.

Mr. McCLELLAN. Yes.

The CHAIRMAN. It is very expensive, however, to run it, particularly by steam, but it is not the object of the Government to build a dam that we have spent \$17,000,000 on to operate plant No. 2. The expenditure of that amount of money, of \$17,000,000, was for the necessary preliminary work and surveys and the actual putting in of the dam. One-third or one-fourth of it, probably, is in.

Mr. McCLELLAN. Yes.

The CHAIRMAN. In connection with it, we have a railway bridge clear across the river, and have cofferdams. There is one cofferdam around there preparatory to building another part of the dam that covers 13 acres. None of that work is permanent work.

Mr. McCLELLAN. No.

The CHAIRMAN. Now, the danger is, as our engineers tell us, and I think it is apparent to any ordinary observer, that that work is liable to be all lost unless we utilize it before it deteriorates to such an extent that it can not be used. Now, the question immediately before us, and it is one that you have been discussing somewhat, is whether we ought to go ahead with the dam and appropriate \$7,500,000, that being the amount estimated it would take to carry on the work for another year, or whether we ought to wait, as you suggest, until this committee that we might select would determine whether that should be done. In the meantime, before that committee gets around and makes its report, perhaps all of this work would go out and several millions of dollars would be lost absolutely, and if we decide afterwards to build the dam it would all have to be put in again.

Is it your judgment, as an engineer, that we ought to stop right where we are before we go any further with it?

Mr. McCLELLAN. No, sir; that might very well come under the head of protecting money already spent, but if I were assured of the competency of my advice—and I have no reason to doubt it, sir, and do not think for a moment that I am doubting it—but if you were assured of your advice, then I would place it in the category of doing those things which are necessary to prevent existing works from further depreciation.

The CHAIRMAN. So far as I know, no engineer or other person, at least within the last six months, has gone on the ground and examined this work but what he has agreed that the dam is all right, so far as it has been done, and that it should be completed. It is part of the Government's plan, in fact, to operate nitrate plant No. 2.

Mr. McCLELLAN. Yes.

The CHAIRMAN. Unless some new discovery is made. A great deal of the evidence before us shows that nitrate plant No. 2 can not be operated, even with this power, in a way to make fertilizer any cheaper than it is being made. There is some disagreement of opinion on that; but, regardless of that, as a war measure, to be ready in case of an emergency, should we not operate plant No. 2?

Senator HARRISON. And originally it was considered as a navigation proposition.

The CHAIRMAN. Yes; I thank you for that suggestion, Senator.

Senator HEFLIN. And without it the river would not be navigable.

The CHAIRMAN. Partially so; yes. As the dam stands now navigation is absolutely prohibited; you can not go up or down the river.

Mr. McCLELLAN. On the basis of your statement right now, Senator, I should say without any question, without having seen it, but in view of the fact that you say that every engineer who has looked at it, and I know that competent engineers have been before this committee—

The CHAIRMAN. That is the point I wanted to make clear.

Mr. McCLELLAN. Therefore, I place that under the category of those things necessary to keep it from deteriorating, and while \$7,500,000 is a large sum of money, we must deal with it relatively. A private corporation, for example, might spend \$7,500 to protect its interests, and that to them might be just as large a sum as \$7,500,000 would be to the Government.

The CHAIRMAN. Of course, it is conceded that \$7,500,000 will not complete the dam. It will take about \$22,000,000 or \$23,000,000 to complete it.

Mr. McCLELLAN. I would still stick to my principle, that the money ought to be spent, whether \$7,500 or \$7,500,000. I stand on the principle of not allowing further

depreciation in any way, shape, or form until the ultimate decision is reached. That is where I stand. You may be quite justified in spending the \$7,500,000.

Senator McKINLEY. Mr. McClellan, is this the proposition that is in your mind, that the Government having spent in the neighborhood of \$100,000,000 there—

Mr. McCLELLAN. Yes.

Senator McKINLEY. It is your idea in all of this testimony that you have been giving the committee that, as \$100,000,000 has been spent, we ought to have the advice of disinterested engineers, taking the proposition as a whole, as to what we should do?

Mr. McCLELLAN. Ultimately. Whether it costs \$7,000,000 or \$75,000 or \$750,000 or \$7,500,000, I do not think it should be allowed to deteriorate, but if that will not complete it, that does not interest me. Of course, so far as I know just at present, that is, for six months of the year, the Government does not make nitrate. I confess that we might like to have that plant or to know that it was there, but I do not believe we ought to part with it, or get rid of anything that is there.

The CHAIRMAN. Of course, we ought to say to you, Mr. McClellan, that as a matter of fact, we do have the power to operate plant No. 2 to its fullest capacity—steam power.

Mr. McCLELLAN. Yes.

The CHAIRMAN. But that is very expensive.

Mr. McCLELLAN. That is very expensive, but, as a war measure, that is of no moment.

The CHAIRMAN. No.

Mr. McCLELLAN. As a war measure that is of no moment whatever.

The CHAIRMAN. The construction of the dam would assist very materially in cheapening the product in time of war, of course.

Mr. McCLELLAN. Exactly.

The CHAIRMAN. And would possibly assist, to a great extent, in solving the fertilizer question.

Mr. McCLELLAN. It might.

The CHAIRMAN. Which Congress had in view as one of the objects when it passed the act under which the President located these works at Muscle Shoals.

Mr. McCLELLAN. But of course you can do it, and in time of war you could get along to the extent of the capacity of that plant. It seems to me, then, that I am sound in my principle, that irrespective of what it costs, within any degree of reason, the plant should not be allowed to deteriorate under any circumstances—that the money ought to be spent. That is the general view that you ought to take in deciding whether the \$7,500,000 ought to be spent.

Let me say there that it is not my opinion that this group of business engineers or engineering business men—and I want to bring that out in the record—would not undertake it for the purpose of designing at all, but, from the standpoint of the United States Government it is my opinion that they would not take years to work this thing out.

The CHAIRMAN. It would be interesting to know about what time you think it would take.

Mr. McCLELLAN. Well, sir, the type of engineers that I have in mind are busy at large projects, and would come into it and take evidence of all sorts, but they would not put a staff in the field and would not make an independent investigation, and I should think that from three to six months would be ample in which to advise this committee.

The CHAIRMAN. And that committee, Mr. McClellan, as I understand it, would take all of the evidence before these two committees?

Mr. McCLELLAN. Yes, sir.

The CHAIRMAN. And I suppose they would visit the place and would look over the situation?

Mr. McCLELLAN. Oh, there is no question about that, so that they could orient themselves, so that each one of them would be acquainted with the project.

The CHAIRMAN. Yes.

Mr. McCLELLAN. But I take it that they would not be required to have the statistical work done or anything of that sort. They would not be paid for their time at all, but the statistical work and work of that kind would really be done by the committees of Congress, and the expense of anything of that sort, of course, would be assumed by the committees here. These men would merely devote their time to it without compensation. That is my view of it.

I say to you frankly that in my official position I would engage to suggest to you men who I know would be willing to do that sort of thing, and men whose standing and integrity would be beyond question—the same type of men as the great lawyers in this country who have taken the Government for their client, and these men, so to speak, would take the Government for their client.

The CHAIRMAN. Senator Kendrick, do you want to inquire of the witness?

Senator KENDRICK. I think not, Mr. Chairman, except that I thought I would ask Mr. McClellan if he did not think that in deciding the question as to whether we should continue the construction of the dam that, in addition to the possibility of its use and the benefits to be derived from its use we might very well consider the money already invested that would be sacrificed, that not only the present use of the money invested would be lost, but, perhaps, in addition the deterioration of the work already done, so that the amount actually invested in construction up to this time might be one of the determining factors as to whether we should go ahead.

Mr. McCLELLAN. Right now?

Senator KENDRICK. Yes.

Mr. McCLELLAN. Oh, no; not unless you are sure that you are not going to get deeper into a hole by going ahead.

Senator KENDRICK. Well, we could not very well get deeper if we proceeded to finish a dam that is clearly in the interest of sound business principles.

Mr. McCLELLAN. Oh, exactly, if it is clearly in the interest of sound business principles, then I think we should go right ahead and finish it.

Senator KENDRICK. It is in line with our whole policy of water-power conservation.

Mr. McCLELLAN. Well, you mean by that, sir, that you are ready to go ahead with another project right off and keep this thing going on?

Senator KENDRICK. Not necessarily, but this has a direct bearing on the service to the Government. It is a little different from the other.

Mr. McCLELLAN. No.

Senator KENDRICK. We need it, as the chairman has pointed out, in the manufacture of nitrates in case of war.

Mr. McCLELLAN. Oh, yes; but in commercial practice—for example, in my own work—one of the most serious problems that I have to decide very frequently in connection with a power house is as to whether it will be an expensive power house to operate or a cheap power house to operate. Very frequently we frankly build a power house which is expensive to operate, because unless you are going to use the power house enough so that the saving in operation is going to make up for the difference in capital cost it pays sometimes not to put in an expensive operation simply because you do not get enough use out of it.

Supposing that we knew—of course we do not know—but supposing we knew we were going to have a war once every hundred years; it might pay us to say, "Well, we will use the steam plant for war purposes, even if it is rather expensive, rather than to have millions and millions of dollars tied up there for a hundred years on which to pay the interest."

Senator KENDRICK. Your statement is based on the assumption that there would be no other use for the power than that which the Government had in serving its own purposes, but there is a demand, apparently, now for practically every bit of power in that country; so that the Government would not find it necessary to allow this power plant to stand idle. There is no reason to believe that is true.

Mr. McCLELLAN. If your information is entirely correct, sir, of course there is very little to be said about the proposition, very little; but I had gotten the impression from newspaper accounts of the hearings before this committee that there was grave doubt as to whether that was a commercial proposition or not.

Senator KENDRICK. I do not think there is any doubt of it, and I do not believe any other member of the committee who has been down there believes that there is.

Mr. McCLELLAN. The impression throughout the country is that this is not a commercial proposition, that there is no market near there.

Senator KENDRICK. Is it not almost an assured fact, if the power is there at a moderate cost, that there would be industries to go there from different sections of the country to employ that power?

Mr. McCLELLAN. I am not sure of that, sir. I do not know. Do not think for a moment that I am denying it. I am not; I do not know. I know that it takes a very long time to build up a market, and if the market has to be built up in that form, we do not regard that as a commercial proposition. I should say that there are water powers in this country far better than Muscle Shoals, from my general information only.

Senator HEFLIN. Where are they located?

Mr. McCLELLAN. In the Rocky Mountains and elsewhere; but they have to have a market brought to them; but if you are going to go on the principle that you can bring the market to them, I think there are lots of them.

Senator HEFLIN. We have been told that there is none other in the country better than this except at Niagara Falls.

Mr. McCLELLAN. I really can not enter into that discussion, Senator, because I do not know. Take one that is under discussion right now, the St. Lawrence River

power. Nobody denies that there is a huge water power there, but the great problem, of course, is the market. In fact, there are those who favor it as a navigation project and there are those who favor it as a power project. The navigation people say "If you wait until the market develops it will be 20 years before we get the navigation facilities." But I am not denying it, sir. I am simply answering the general proposition that until you are sure of that it would be very unwise to either give it to anybody or to rent it to anybody.

Senator NORBECK. Is that two or three?

Mr. McCLELLAN. The whole thing, whatever is down there. The same principle applies to all of it.

Senator NORBECK. We are at a considerable expense on plant No. 2.

Mr. McCLELLAN. Yes.

Senator NORBECK. Because it is partly constructed.

Mr. McCLELLAN. In other words, I would rather see this committee reserve its decision for six months or even a year, and in the meantime spend whatever is necessary to protect the works and make a right decision, with the help of competent advice.

Senator NORBECK. There can be no other decision than to complete the dam, according to present plans, can there, at No. 2?

Mr. McCLELLAN. No; there can not be any other decision.

Senator NORBECK. We would make no serious mistake if we should go ahead and complete that dam which is now under construction there?

Mr. McCLELLAN. I suppose not. That is assuming that it is not going to cost very much more than what you say it is going to cost to complete it. It depends on what it is going to cost. I know this, that if it costs \$50,000,000 to complete it, and it stands there complete, you would have added \$50,000,000 to your burden, unless you were going to use it. Somebody, after they had studied the thing out, might say, "Well, after all, this really is not the place for a nitrate plant, anyway."

Senator KENDRICK. Well, assuming that it was not a place for a nitrate plant, is it not your opinion—

Mr. McCLELLAN. Then, you might find that you had spent all of that money and you had to go to some other place and spend some more.

The CHAIRMAN. I think it is conceded that, so far as the nitrate matter is concerned, there will be great improvements and inventions which may make it necessary to scrap every bit of the nitrate machinery that we have there, and we will all be glad to scrap it.

Mr. McCLELLAN. Yes.

The CHAIRMAN. If the method is so improved that we can manufacture it more cheaply, but as the situation is now we have not anything except nitrate plant No. 2.

Mr. McCLELLAN. With the steam plant.

The CHAIRMAN. With the steam plant, to make the nitrates for our supply in case of war.

Mr. McCLELLAN. Yes.

The CHAIRMAN. If we should be cut off from Chile.

Mr. McCLELLAN. From the standpoint of war requirements you could start up the steam plant and go ahead and make it.

The CHAIRMAN. Yes; we might go ahead to-morrow.

Mr. McCLELLAN. Then, that removes any necessity for an immediate decision.

The CHAIRMAN. Except for the fact, I think, that we have the dam one-third completed.

Mr. McCLELLAN. Yes.

The CHAIRMAN. If you assume that what I have said to you is correct, assuming that I have told you the truth about it and have gotten it right in my statement to you, there would not be any doubt in your own mind that we ought to appropriate \$7,500,000 to complete that dam?

Mr. McCLELLAN. There would be no doubt at all, but I still go back to my point—

The CHAIRMAN. Of course, if we get Dam No. 2 completed, there is no stopping then.

Mr. McCLELLAN. But you said a few moments ago that the \$7,500,000 would not complete it.

The CHAIRMAN. No, sir; that is one-third of it.

Mr. McCLELLAN. So I would really stick to my principle that instead of spending the \$7,500,000 you ought to proceed with the idea of protecting things and holding it so that there will be no further loss pending this ultimate decision as to what you are going to do with the whole grand project.

Senator NORBECK. One of the surprising developments to me has been that the nitrate problem seems to be not so directly connected with the water-power problem.

Mr. McCLELLAN. It is not.

Senator NORBECK. That cheap nitrate and cheap water power do not necessarily mean cheap fertilizers.

Mr. McCLELLAN. No, sir; I do not think it does.

The CHAIRMAN. If the dream of the scientists comes true that, through the Haber process, so far as the production of nitrates from the air is concerned, the problem is to a great extent eliminated, it would be only incidental and we could locate a nitrate plant anywhere that it was safe from attack.

Mr. McCLELLAN. There is one aspect of this question, gentlemen, of course, that is very serious, and that is that the Government, as you know, struggled for years with the water-power bill. People on the outside and the officers of the Government, as well as Members of Congress, wanted to know some things in an attempt to protect the Government, and a conclusion was finally arrived at in the water-power bill.

Now, this country is unquestionably going on a basis where power is going to be one of the most serious things that it has to consider. We have got to compete with the rest of the world as we have never had to compete before. There is no question of that, particularly in foreign trade, and we are meeting that competition right here in this country. We have to cut our transportation costs some how or other. We can not continue under present conditions, and we have to cut our transportation costs very seriously somehow or other. We have to be in a position to deliver our grain in Liverpool at a less cost, or else to ship out our cattle, either one or the other. We also have to compete with the low scale of living in almost every other part of the world. We do not want to lower the scale of living in this country, and that means that we have to put machines in our factories to enable a man here to produce three or four times as much as a man in the foreign countries can produce. Otherwise we will not be able to compete.

Now, all of these things require power. Power is the very bottom of it all, and therefore this country has got to improve on power development as it has never before been done.

In this great proposition that we have at Muscle Shoals, now that the Government is in it, it is of extreme importance that no mistake be made there. That is another side of the matter, and the moral effect of a mistake made right here is going to be very serious on other power developments in this country, and I do not hesitate to say that it may set back water-power development a great deal if a mistake is made here. That is the reason I came down here this morning.

Senator NORBECK. Like that of the Government railroad in Alaska?

Mr. McCLELLAN. Absolutely. Mistakes of that sort react seriously, and we can not afford to make a mistake here in the grand solution of the problem. For that reason we have to be very careful as to just what is done and how it is done.

Senator KENDRICK. On what point are you anxious? Are you disturbed lest if we build this power plant, finish this dam, and develop a great power plant there, we would not find a market for it; is that it?

Mr. McCLELLAN. Partly that.

Senator KENDRICK. And is it because you think that we may build the dam according to wrong principles of engineering?

Mr. McCLELLAN. I am not a bit afraid of that; no. I am quite confident that the technical part of this work will be done and done well by the men who have been connected with it, the men the Government are likely to bring into it, or any other persons who might be brought into it; but I do know that railroads have been built in this country in the past where men have been absolutely convinced about a rosy future, and reports came out year after year, perhaps for 20 years, that the thing was stumbling along, and it took 25 years before it was successful. When a similar proposition is up, you men who have a vote in Congress will vote against it, on account of the public opinion which has been created, although it might otherwise be a very good proposition. Public opinion will be created against power development if the same kind of a mistake is made here. My point is that it would be better for this not to be done completely rather than to make a mistake that would interfere with the general power development or which will prevent our power developments from receiving a proper reception.

Senator KENDRICK. Is it not reasonable to suppose that the engineers have already considered the practical features of this power plant before it was begun?

Mr. McCLELLAN. Yee; but I will say to you, without definite knowledge of it, Senator, that I do not believe from all I can learn in general conversation among engineers and business men, if the war had not come along Muscle Shoals would ever have been started as a commercial proposition.

Senator KENDRICK. I will say this to you as a business man, that I had no idea in the world that there was such a possibility of development of water power in the eastern part of the United States, outside of Niagara Falls and the St. Lawrence River, as there

is right there. I live in the Rocky Mountains, and the flow of water at Muscle Shoals, as tested for 50 years, shows that the supply is dependable.

Mr. McCLELLAN. Yes.

Senator KENDRICK. You spoke a moment ago about the question of transportation. One of the features of this proposition that appeals to me is that there is water transportation right into the heart of the Nation and then out to the seaboard from this plant.

Mr. McCLELLAN. I am not denying any of those things. I am only pleading that all of this testimony that you have had here be brought together under a technical and business review, with the idea of solving that problem, not stopping it, not letting it alone, but getting a proper answer in the shortest possible time.

Senator NORBECK. Would you say that there would be sufficient revenue to justify a further investment so that it would be put on a paying basis within a reasonable time.

Mr. McCLELLAN. That should be considered as a matter of broad public policy, the same as you would build a great highway across the country.

Senator KENDRICK. We have the proposition, as I understand it, of the return to the Government of interest on the income from the dam from now on. I have never been able to understand why it should not include the amount already invested in the dam. That interest is at 4 or 4½ per cent, as I understand the proposition.

The CHAIRMAN. Four per cent.

Senator KENDRICK. Within the course of a few years we may hope for a more satisfactory return on the money.

Mr. McCLELLAN. Exactly, and it may be that the scale, the ladder or the spread of these charges are on a very different basis than what is proposed.

The CHAIRMAN. That reminds me, Mr. McClellan. Take this as an illustration, now: Of course, the Government ought to have some definite policy. I think it is conceded by engineers and scientific men that the right policy to get all the power there is out of a proposition is, when you take up a river like, for instance, the Tennessee, which we have embarked on, you ought to take it up as a whole.

Mr. McCLELLAN. Yes.

The CHAIRMAN. You ought to take up every tributary that flows into it.

Mr. McCLELLAN. Yes.

The CHAIRMAN. Especially in the southern country, and particularly in Tennessee, where the difference between the minimum flow and the maximum flow is so enormous; that that is the way to get the most economical results in the end, and that is what we are all striving for, that we should take up the whole Tennessee River.

Mr. McCLELLAN. Absolutely.

The CHAIRMAN. And build as many dams as may be necessary.

Mr. McCLELLAN. Wherever it is necessary to prevent the inequalities.

The CHAIRMAN. Now, when you take into consideration that broad fact, nobody can do that except the Government.

Mr. McCLELLAN. Nobody can do that except the Government.

The CHAIRMAN. Yes.

Mr. McCLELLAN. That is the reason I said in my opening remarks fundamentally I believed in the Government doing that sort of thing.

The CHAIRMAN. It may be, when we investigate, we will not find locations, perhaps, where it will pay to construct reservoir dams.

Mr. McCLELLAN. Exactly.

The CHAIRMAN. And if we can not find them we will have to give it up, of course. Now, when you come to a power proposition and if you amortize it over a few years, it would be prohibitive to put in this thing.

Mr. McCLELLAN. That is the thing.

The CHAIRMAN. But if the Government would go into it and amortize it over a period of a hundred years, perhaps 200 years, it fades away into nothing.

Mr. McCLELLAN. It fades into nothing. The Government, of course, can make these great improvements and raise the money through taxation by act of Congress. By increasing the income tax tremendously the Government gets an indirect return. Perhaps that is the only justification, in the last analysis, for putting such a burden on the general public, because everybody, either directly or indirectly, is benefited.

The CHAIRMAN. Of course, in this other scheme, if a private individual were himself to construct a dam to develop power, under the law he would be required, then, to contribute his share—

Mr. McCLELLAN. Yes.

The CHAIRMAN. To construct the reservoir sites.

Mr. McCLELLAN. Oh, yes.

The CHAIRMAN. Now, we have down there on the Tennessee River one of the most remarkable water-power propositions in the United States.

Mr. McCLELLAN. Yes; you have.

The CHAIRMAN. Without any doubt?

Mr. McCLELLAN. Without any doubt.

Senator KENDRICK. Well, if we were to begin the comprehensive plan of development that you gentlemen have outlined, would it not be the most practicable, the common-sense way to first build these dams that we have and then build your reservoirs for supplemental power as you find sale for the power that you had to begin with?

Mr. McCLELLAN. Oh, unquestionably, sir.

The CHAIRMAN. You ought to first go ahead with the dam, of course. I am in favor of that. Then, you ought to have a comprehensive survey of the whole thing, and you ought not to wait until this country is all settled up and developed before you commence to build these reservoirs. If you do, the price is going to be prohibitive.

Mr. McCLELLAN. As I say, I am very much in favor of this. I am personally interested in seeing the water-power development of this country go ahead. I want to see it go ahead in my business, but I am only pleading from the standpoint of the union of the Government and any private interest, I do not care who it is or what it is. The eyes of the people of this country are focused on this first great proposition, and we want to have this union of Government and private ownership in such a way that it will move along smoothly and help the situation. I hope it will go ahead quickly. The men I have in mind ought not to take any longer than six months on this proposition, because they have not the time to give to it, to sit around and have a whole lot of meeting to discuss this thing; but, in the last analysis, you may, for example, put your power dams there, if that is the wise decision, and you can supplement them with steam plants, probably, as time goes on. These other things might not happen for 20 years, and by that time these steam plants can be scrapped. That proposition is being worked out by private interests here and there.

Senator HEFLIN. When did you first become interested in this project at Muscle Shoals, Mr. McClellan?

Mr. McCLELLAN. When did I first become interested?

Senator HEFLIN. Yes, sir.

Mr. McCLELLAN. I had no interest in it except as an ordinary citizen during the war. At that time I had just the common interest of an ordinary citizen, and except for reading of it in the newspapers I knew nothing about it at all. About two years ago the American Engineering Council was formed, and projects were coming in to us with suggestions that we do something about Muscle Shoals—that is to say, to look into it and all that sort of thing. We began to think of the matter then in a rather desultory way, but not definitely. Then, when I became president of the American Institute of Electrical Engineers in August, we had various objections from different places to the effect that the American Institute ought to look at what was going on there in the interest of the general electrical, civil, and mechanical engineering, and it has been sort of growing, nontechnical, but rather a business and economical interest from that time on.

Senator HEFLIN. Various interests have suggested to you that Muscle Shoals was a good project and they wanted to have you look into it and express some opinions about it?

Mr. McCLELLAN. No; I would not say that. I simply remember that various members of the council would get up and raise a question.

Senator HEFLIN. Did not they represent the same interests that would be liable to invest money down there and take over this project if they could get hold of it?

Mr. McCLELLAN. No, sir. I will tell you frankly what it was. The Federated American Engineering Societies was formed by the big national societies getting together jointly with the idea of doing two things, and you will find this in their constitution, first, to assist the Government; and, second, to work for professional engineering. Now, all of the members of that board, with that idea in mind, were looking over the country and hunting projects, and you will remember they made a report on the reduction of waste in industrial plants. In order to carry out their constitution they were looking at various things all over the country that they might help in or do something in regard to, and I am very confident that it was just the individual desire of the members of the board in looking around, and they said, "Here is Muscle Shoals; apparently there is a great difference of opinion about it; one big manufacturer is trying to get it and certain other people are fussing about it. Why should we not take that up as a place where we can help the Government?" There has been no proposition that has come from anywhere, and I was chairman of the finance committee, and I was also an active member of the board, and I would know.

Senator HEFLIN. You never made your suggestion about appointing a committee to look into it until Mr. Ford and others had filed their offers with the Secretary of War?

Mr. McCLELLAN. No, sir; and I know the advice that you have had has been from able men, absolutely, and I also know, in many cases, the very men who have been retained—and I do not raise a shadow of doubt as to their honesty, but I know they

look at it from a single angle—have been before you. Now, we know all of this, and that is the reason I make this proposition this morning.

Senator HEFLIN. Well, if they were retained by Mr. Ford or anybody else to make a record of that project down there they were not doing anything more than the people who brought the matter to your attention.

Mr. McCLELLAN. Exactly.

Senator HEFLIN. They were looking at it for themselves, and trying to get somebody to take this project up and develop it.

Mr. McCLELLAN. Precisely. That is the point.

Senator HEFLIN. Now, after the Government ceased working on this dam you just permitted it to lie there and said nothing about it until somebody tried to get hold of it.

Mr. McCLELLAN. Some of our members thought that this was a place we ought to look into. I do not know whether it was really to help or make a good name for their federation, or what it was.

Senator HEFLIN. They saw that Mr. Ford was trying to get it and then they said, "We will pitch in."

Mr. McCLELLAN. I do not think I would take that point of view. One of the most active men we have there—

Senator KENDRICK. May I interrupt a moment right there, Mr. McClellan? I think what you intend to have us understand is that no member of your organization was financially interested in this.

Mr. McCLELLAN. Oh, not a particle, or retained or connected in any way.

Senator KENDRICK. There was that difference?

Mr. McCLELLAN. There was that difference. They were not actually retained.

Senator HEFLIN. But if a committee should be appointed and that committee should make a recommendation that a certain disposition be made of it, it may later on turn out that they will become interested, or you might have some interest in it.

Mr. McCLELLAN. Oh, certainly; you can not tell anything about that.

Senator HEFLIN. No.

Mr. McCLELLAN. That is true.

Senator HEFLIN. Now, Mr. McClellan, if a committee were appointed, would not these very interests who are now fighting Mr. Ford's offer, in one way or another, directly or indirectly, besiege the President to appoint a committee that would see to it that Ford did not get this project?

Mr. McCLELLAN. Oh, my dear Senator—

Senator HEFLIN. And would not they impose upon the President by getting him to appoint men who would be interested in this project, and their service would amount simply to a postponement of the thing until these people got tired of fooling with it and would withdraw their bids, and then they would succeed in doing what a great many of them want to do, to keep anything from being done at Muscle Shoals in the hope that they can buy it later on for nothing, practically?

Mr. McCLELLAN. I would only agree to a part of your proposition, sir. I believe every interest in this country wants the development of Muscle Shoals, and if there is any that does not it should. I believe that any interest in this country that wants Muscle Shoals developed, that wants it developed by a special plan, would besiege the President and you men in Congress here. They would besiege everybody. Now, if you ask me whether they would not impose upon the President, I can not be so uncomplimentary to the President of the United States—

Senator HEFLIN. Well, Presidents are frequently imposed upon.

Mr. McCLELLAN. Well, that may be, but I think he would have equally good advice from another direction, and while mistakes might be made I am confident that what I am proposing here is not a commission to settle this thing. I am not proposing that at all. I am leaving the settlement of this thing to engineers who are doing this work. You can put it entirely in the hands of this committee, acting together with the committee of the Senate and the committee of the House, and they would come to a decision. This committee that I suggest would publish no report. They would hand in a report to the chairman of this committee, and would act, so to speak, as advisers in the matter.

Senator HEFLIN. Is it not the man, though, who persistently works at a thing who finally succeeds in putting it over; is not that true?

Mr. McCLELLAN. I do not think there is any question about that.

Senator HEFLIN. Now, as to these people who want Muscle Shoals, who do not want Mr. Ford to have it, would they not be the most likely people in all the country in seeing to it that the President appointed a committee that would be favorable to their ideas in the matter, and might they not get behind some man here and yonder

that the President would not know, a man that he did not think had any connection with these big interests, and when the commission was appointed the President might find that he had a commission that was not so disinterested, perhaps?

Mr. McCLELLAN. If I were to agree to that proposition—

Senator HEFLIN. But a commission that would do exactly what these people want done?

Mr. McCLELLAN. If I would agree to that proposition I would be agreeing to the fact that there can be no government except by interests, and I do not believe it. That would be agreeing to the statement that this committee right here could not decide it somehow or other. I do not believe it. Do you mean to tell me that this committee or the President of the United States or anyone else can not, if they want to, get a group of men who will give them disinterested advice, in spite of the fact that the interests might be working against it?

Senator HARRELD. We would be in bad shape if that were the situation.

Mr. McCLELLAN. There would be no government, absolutely none, if I said yes to that proposition; so I have to say a very decided no, if I have any faith in the intelligence of men.

Senator HEFLIN. We know that commissions have frequently been appointed who have not served the interests of the country as a whole, and when you appoint a commission to look into a thing like this, you are just simply postponing the day when the development will take place.

Mr. McCLELLAN. Well, I have only to say to that that I do not plead for postponement. I do not call six months—

Senator HEFLIN. Take this, for instance: You would be willing to serve on the committee?

Mr. McCLELLAN. Well, I am the president, and I did not say that, but—

Senator HEFLIN. Yet you have committed yourself here to the proposition that you would be willing to leave that dam just like it is, which stops navigation on that river when, prior to the construction of it there was navigation there for 10 months in the year; you would injure navigation and commerce to that extent and you would permit all of these cofferdams to be washed out and to deteriorate, and you would let everything else there deteriorate, rather than to spend \$7,500,000 that is necessary.

Mr. McCLELLAN. Does any other member of the committee think that I said that? If he does, I wish to correct that at once, if anybody got the impression that I would not spend every dollar necessary to hold that thing right where it is and prevent one dollar's worth of deterioration. I have said that distinctly.

Senator HEFLIN. Yes, I believe you did after it was corkscrewed out of you, but I got the impression at the outset that you were just as willing to let it stand there.

Mr. McCLELLAN. If I may have my remarks read, sir, you will see that I said before Senator Norris raised the question that the first thing I would do would be to protect the improvements there.

Senator HEFLIN. Then, the chairman suggested to you that it would take more than \$7,500,000, a good deal more, and I understood you to say that you would spend some money and just hold what we have got there, but not complete it for the present.

Mr. McCLELLAN. Pending the six months' decision as to the best way to do it.

Senator HEFLIN. Yes.

Mr. McCLELLAN. That is all.

Senator HEFLIN. Do you think it is the business of such a commission to tell us what is the best thing to do down there when months and months elapsed after the Government withdrew its forces and quit work on the dam, and when you and other engineers said nothing about it whatever; you were silent as the tomb, but when Mr. Ford made us an offer and when some others make offers, and it looks like Congress is about to dispose of it and complete navigation on that river, and develop that power, you will come in and suggest the appointment of a commission. Now, why were you silent for all of those months about the development of that project down there?

Mr. McCLELLAN. Why were we silent?

Senator HEFLIN. Yes.

Mr. McCLELLAN. It was probably simply because we were not up to the point of doing those things promptly. Personally I have no hesitancy in saying that I had a letter written just before this proposition came to Congress at all, while it was still in the hands of Secretary Weeks, and I destroyed the letter when I found it was turned over to Congress, feeling that it was too late to write to him. I think this proposition ought to have been adopted long ago and I think we, as engineers and as citizens of this country, if we had been alive to our responsibility in the matter, should have made this proposition long ago. I think we have been remiss in delaying things so long.

Senator KENDRICK. You place it on the ground that there had been no discussion of it.

Mr. McCLELLAN. It was just a case of being nobody's business.

Senator HARRELD. A case of what is everybody's business is nobody's business.

Mr. McCLELLAN. If my mind had gone in that direction I might very well have telegraphed, "I can not come down to-day, I am very busy," and have stayed out of it still longer. Frankly, I decided personally and privately to come down here and have this talk.

Senator HEFLIN. And we are very glad to have the benefit of your suggestions in the matter.

Senator KENDRICK. I do not know whether you have been in touch with it or not, but it is generally conceded that the cost of improving the navigation will not materially increase the cost of the dam.

Mr. McCLELLAN. That is right, sir.

Senator KENDRICK. I think that is something of an incident, as I understand it.

Mr. McCLELLAN. It is.

Senator KENDRICK. It enters in as a part of it, without increasing the cost particularly.

Mr. McCLELLAN. As I explained a few minutes ago, \$7,500,000, while a very serious sum of money, would not be considered a greater sum by the government than if a private corporation spent \$75,000 or \$750,000.

Senator NORBECK. If I understand correctly, this proposition has been open to the general public for many years under the water power act, and if these interests are really suspicious, all of that time they could have gone into it and developed it if they had seen any profit in it; is not that right?

Mr. McCLELLAN. No; not under the water power act. That was only passed six years ago, I believe, although I am not certain as to just when it was passed.

Senator NORBECK. Well, it came under the water power act at one time, and it was open to the general public. Anybody could have applied for it.

Mr. McCLELLAN. Anybody could have applied for it if they thought they could make money out of it.

Senator NORBECK. And it did not look promising from an investment standpoint.

Mr. McCLELLAN. That is it.

Senator NORBECK. The weakness of that development lies in the fact that the river is so very wide that a dam is rather expensive for the horsepower to be developed.

Mr. McCLELLAN. I think that is undoubtedly true, but, in addition to that there is the fact that you have a period of years to wait before the market is built up. I went all through the Niagara Falls development, and if you will recall, they originally built a transmission line 150 miles, to Syracuse, to help them get a market for it. So far as Niagara Falls power is concerned, that line is not necessary now, because every bit of power can be used right there at Niagara Falls.

Senator NORBECK. That is what I am getting at. If we had the dam completed, and if only one-half of it or one-third of it was available, would not the very fact that there was a supply of power there available tend to produce a market?

Mr. McCLELLAN. That is the only way a market will ever come.

Senator NORBECK. Therefore, we should be a little ahead of the market instead of a little behind it?

Mr. McCLELLAN. That is the idea; but I am anxious that when the Government joins private interests in doing this thing it will be an encouragement to take up other things and go ahead in the right way and develop the country.

Senator HEFLIN. But that plant down there has been abandoned, and none of these big concerns were interested in the fact that it was abandoned. They did not want it developed unless they could get hold of it, and it was natural for them to wait until a few months or years had gone by, when they could say, "It has been neglected now for so long, we will take it as so much junk." It was neglected and abandoned and Mr. Ford came along and he took Mr. Edison with him, and they marveled at the possibilities that they saw there, and Mr. Ford came back and went to the War Department and made an offer. He said, "It has been abandoned; I will take this thing over and I will manufacture fertilizers down there."

Senator NORBECK. "If I can make 8 per cent interest."

Senator HEFLIN. He said, "I will practically cut the price in half," and that means a great deal to the farmers of this country.

Mr. McCLELLAN. What bond does he give? Have you a guarantee that he will do it for you?

Senator HEFLIN. Well, we are going to get him into a contract that he will make fertilizer. He would not, of course, guarantee that he would cut the price in half.

Mr. McCLELLAN. Does he want any Government help?

Senator HEFLIN. But he claims that he has a secret process, and we know that the fertilizer trusts are fighting him and do not want him to have this. They have been carrying on propaganda work here, writing to Senators and Members of the House,

against turning this project over to Mr. Ford. The power companies are fighting him, too. But he went down there and saw this thing, and then he made this offer to the Government, and then one or two other offers came in. Various witnesses have been here testifying that this ought to be done and that that ought to be done, and it seems to me that there is a disposition in it all to keep Ford from getting it. There is a concerted effort to keep him from getting it.

Mr. McCLELLAN. Of course, I do not know anything about—

Senator HEFLIN. His offer has been indorsed by the farmers of the West and the farmers of the South, and if it is accepted it will serve a great and good purpose. It will open up navigation, it will develop power, and it will manufacture fertilizer and give the people there employment, as I understand he is going to build an industrial city down there. He has the money to do it with; he is a wonderful man and it looks to me like some of these other concerns simply do not want him to get it.

Mr. McCLELLAN. Suppose Mr. Ford goes broke in three years, and the Government is saddled with something of that kind. What are you going to do then? How do you know that Mr. Ford or anybody else is going to be in a position to carry out all of these promises?

Now, I hope Mr. Ford will get it, if his proposition is a good one, and your investigation shows it. I have no objection to Mr. Ford, but what we need is information.

Senator HEFLIN. Yes; we got a lot of information on it, and this information was not sought until Mr. Ford made his offer. That is the point I am making.

Mr. McCLELLAN. So it is possible, sir, that that might be an argument against it, for the very reason that the proposition may not be valuable in that sense, and the information was not necessary.

Senator HEFLIN. It appears to me that those interests who do work in concert just simply intended that that thing should lie still until in their own time they would take it up and get it for a song from the Government; but Ford heard of it and went down there and saw it with Mr. Edison, and said it was a great thing, and it ought to be developed. Now, after Mr. Ford came back and made the offer, here come various interests telling what a great thing it is and it ought not to be turned over. I think it is their hope that if the Government undertakes to develop it and does not let somebody else have it, it is not going to be developed. I believe that those interests think that if the Government holds onto it they can prevent development down there.

Mr. McCLELLAN. Those interests are even more powerful, do you think, than the United States Government?

Senator HEFLIN. No.

Mr. McCLELLAN. I do not understand if the President of the United States and the Cabinet and Congress all are here to represent us as the United States Government—I hesitate, sir, very seriously, to think that I have got to go back home and think that there are interests here that are going to defeat this United States Government; that we can not solve this problem because of those interests.

Senator HEFLIN. Here is a combination that says it ought to be postponed until a commission can look into it.

Mr. McCLELLAN. What combination? I would like to have that settled. Do you mean my proposition?

Senator HEFLIN. I say here is a combination of interests among the people who will say that it ought not to be developed until a commission can look into it and say what ought to be done with it, and a few members of Congress maybe will be for that. Here is another proposition that says the Government ought to develop it, and all of them conscientious, and a few will gather behind that proposition. Then there are others who will say that this interest ought to have it, or that, and we will divide on that. So the interests who do not want development success, whether they do it directly or indirectly.

Senator NORBECK. If I had the faith and confidence in human nature that you have I would not vote to spend one dollar on the Tennessee River or any other river.

Senator HEFLIN. I have great faith in the Government and great faith in the people of the Government, and a great deal of love for the people of the United States, and I am doing my best to serve their interests and not those of the special interests of the country.

Mr. McCLELLAN. May I simply say I can not take your point of view, sir? But this is my picture: I see a great project there in which the Government and private interests have got to join. I see a committee here which has one of the most serious responsibilities any committee ever had in the economic problems of our country; and I see back of that committee the President of the United States, who will have to finally join in it, I suppose, and I simply come here, not in any interest. I represent no interest. I am not connected with any interest. All the engineers of this country are offering to place their services at your disposal, not to impede this prop-

sition, not for elaborate investigation, but to help you to solve the problem, that is all—help you to arrive at a conclusion, taking from three to six months to do that. If that is too long and you want a shorter report, the same group of men would individually do the best they could in a shorter period. If you want to have all this in two months or three months, they will help you to do what I do not believe you can do as well without them. That is all I am offering, and it is up to you to fight those interests, if they are there. It is not our business to fight the interests, except to retain our own personal integrity and give you information as we see it.

Senator HEFLIN. I am interested in having this project developed down there in a way that will serve the most people in the country, and I believe the offer of Henry Ford will do that. He is the only one who proposes here to make fertilizer.

Senator NORBECK. What does the Ford offer propose, Senator, in the way of fertilizer? The farmers of the country are interested in that more than in anything else.

Senator HARRELD. The trouble is that a great many of us want to adopt a resolution to accept Ford's offer, whatever it is. I can not swallow that kind of thing.

The CHAIRMAN. Let me suggest that as we go along we do not discuss these various offers. When we get through with all the witnesses and the others, we will lock the doors and fight it out amongst ourselves.

Senator NORBECK. And you will act as referee.

The CHAIRMAN. Are there any further questions anyone desires to ask Mr. McClellan? If not, Mr. McClellan, we are very much obliged to you for your information.

Senator KENDRICK. Mr. Chairman, I think it might be important to confirm the impression I have in regard to Mr. McClellan's attitude.

As I understand you, your attitude is that of a citizen of the United States. You are president of the American—

Mr. McCLELLAN (interposing). The American Institute of Electrical Engineers.

Senator KENDRICK. A group of men who would naturally have information and general information on all such questions as this?

Mr. McCLELLAN. Yes. There are 13,000 of them.

Senator KENDRICK. You are concerned in this more particularly because of the fact that it has to do with your line of work? That was the first thing that attracted your attention? Is not that it?

Mr. McCLELLAN. Yes. We think we have an understanding of the problem.

Senator KENDRICK. And your interest here is in no sense a financial one?

Mr. McCLELLAN. Oh, not the slightest. I do not expect to have the slightest thing to do with this thing. I know I won't be employed in connection with it. I know that.

Senator KENDRICK. Is it your idea that the gentlemen who would serve on a commission appointed would serve for pay or without pay except expenses?

Mr. McCLELLAN. My idea was that they were to serve without pay.

Senator KENDRICK. That was my impression.

Mr. McCLELLAN. Absolutely. I used the word "invited" and not "appointed"; invited to serve and to serve without pay. I suggested that the expenses of summarizing and analyzing the information would really be the expense of your committee, so to speak, and it would not have to pay us, even as a commission, for that, but if you would arrange, as a committee, to do that work. You have got to analyze it, I suppose. You have got to summarize it; you have got to get it in shape. We simply come in and do that, and study the stuff, and make a general report.

Senator KENDRICK. I am interested in clearing up these points because that was my idea of the witness's attitude, and, personally, I think that we could not, any of us, afford to do other than appreciate in the highest degree that disinterested spirit of citizenship that wants to see the Government proceed not without information but wisely and well.

Mr. McCLELLAN. Let me say further, sir, that I mean, too, that of course the Senate committee would do all the appointing; that when you invited these men to serve you would have before you in the greatest detail their lives and every activity in it. We do not propose to offer five men to you that you either accept or don't accept, but we simply join with you in helping you get people. If you don't want this person or that person, you will have their lives before you, you will have the appointing, you will have the selecting with your eyes wide open with regard to the name and integrity and standing of great societies in this country that have Mr. Ford's engineers as members, with every big company, corporation engineers, members of it, every engineer of prominence in this country being a member of the American Institute of Electric Engineers—every electrical engineer. Therefore my board of directors and I myself can not do anything and will not do anything that is going to break the good name of that society that has been in existence for so many years, with all these divergent interests clashing in it, because we would hear from it in a moment.

Senator KENDRICK. It is also true that the information submitted to this committee for consideration would not have any binding effect on the committee whatever?

Mr. McCLELLAN. None whatever, and would be absolutely confidential.

Senator HEFLIN. Would you not have the same trouble that this committee is having? Suppose you appointed a committee of five or six. What would happen as soon as those men were appointed? Would not the various interests come in and lay their plans before them?

Mr. McCLELLAN. We would have no hearings. We would pay no attention to anyone. We are not an investigating committee. You are the investigating committee.

Senator HEFLIN. Then you would not seek any information at all?

Mr. McCLELLAN. We would go down to the project itself and look it over. I don't believe anything we could do would give us any more information than you have before you as to the Army engineers' costs, Mr. Ford's costs, and other things like that; and if we wanted anything of that kind, I think probably—I don't know; I can not speak for this commission, but they would be under your direction absolutely, and I imagine that they would ask you to get any such information they wanted.

Senator HEFLIN. This committee went down there and, so far as I know, every member of it was wonderfully well pleased with what he saw, and every one of them came back stating that the thing ought to be completed at once; that there ought not be any delay about completing that dam, and that it was an outrage to let that great project stand idle and that water power go to waste and the navigation be obstructed as it was being obstructed. If we appoint a commission of six and postpone it for six more months, that commission might report that something ought to be done on it, and somebody else will suggest another step to be taken in order that development might be had. In the meantime these people who are bidding for this thing might say, "Oh, well, they are not going to do anything," and quit and go and invest their money somewhere else. Then, if they did, this project might remain as it is now, and some of the concerns who hope to get it some day for nothing will succeed. That is what I am afraid of.

Senator KENDRICK. Senator Heflin, assuming that the committee proceeded to do the things that they have agreed upon; for instance, we practically agree on the advisability of securing an appropriation through Congress, if possible, to proceed with the completion of the dam. The experts tell us it will take three years to complete the dam and that they will find it necessary to employ as much as \$7,500,000 during the year 1922. We could proceed to get that under way as fast as possible. Such a commission as Mr. McClellan has suggested could probably report their recommendations to us before we could decide ourselves, and it would bring that much more actual practical experience to bear on the general situation.

Senator HEFLIN. But what member of this committee—I am ready to act as soon as these hearings are over. I think I know what I want to do in regard to that thing. I believe I know what two-thirds of the people of the United States want done. I don't think there is any doubt on earth about seven out of every ten people in the country being in favor of Ford having this proposition.

Senator NORBECK. Without knowing what he has guaranteed in the proposition that he makes.

Senator HEFLIN. That he is going to manufacture fertilizer cheaper than it is now being manufactured.

Senator KEYES. How many people in the United States do you think know what the Ford offer is?

Senator HEFLIN. Oh, all of them, Senator.

Senator NORBECK. I am frank to say that I did not know until the last 10 days.

Senator HEFLIN. Very wide publicity has been given to it. Very wide publicity.

The CHAIRMAN. Let us eliminate any decision as to Ford and these other fellows and go on with the testimony.

Senator HEFLIN. Just one other thing, Mr. Chairman, in response to Senator Kendrick. They want to put off six months with this commission. That just postpones action that much longer.

Mr. McCLELLAN. Make it three months. I said this commission could make a shorter report in three months.

Senator HEFLIN. And I don't think this commission would help this committee one particle.

The CHAIRMAN. Again let me suggest, gentlemen, that we are not going to pass on the question whether we are going to get a commission or not. We will do that when we have gotten together in executive session to fight this thing out. Let us not debate that now. Let us go on with the evidence.

Senator HEFLIN. All this record will be read, Mr. Chairman, long after this controversy is over, and we want to get in all the facts that occur to us and the interests involved.

The CHAIRMAN. Yes; but we are taking evidence now; we are not going to debate that now.

Mr. McCLELLAN. It is clear, is it, Mr. Chairman, that I agree on the wisdom of spending that \$7,500,000 now?

The CHAIRMAN. I think so.

Mr. McCLELLAN. The only thing I said was that, of course, it was important that we should not lose a dollar of what has been done there, and should go ahead.

The CHAIRMAN. Yes. I think we have a clear understanding of it.

As to when this question of what we are ultimately going to do with it will be decided, I think everybody knows, from the way things are decided in Congress, it is going to be a good while before we do it. I confess I would like to do it to-morrow, but I won't have my way about it. Neither will the rest of us. It is a big question, and we will not get it through this Congress. We know we won't get it through this Congress.

Senator HEFLIN. I don't agree with that, Mr. Chairman.

The CHAIRMAN. I hope you are right, Senator Heffin, but you know how these things go in Congress.

Senator HEFLIN. Yes; I do.

The CHAIRMAN. And with the tariff dragging along and the other things, the fellows that want to get in their campaign and get through and get home, I think it is hopeless to think of getting it through this Congress.

Mr. McCLELLAN. It is of the greatest importance that you get that thing in shape so you won't lose anything.

Senator HEFLIN. We have to get that \$7,500,000 through this Congress.

Mr. McCLELLAN. That looks to me very reasonable.

The CHAIRMAN. If there is not anything further, Mr. McClellan, we will excuse you. We are much obliged, sir.

Mr. McCLELLAN. You are entirely welcome.

STATEMENT OF MR. GRAY SILVER, WASHINGTON REPRESENTATIVE OF AMERICAN FARM BUREAU FEDERATION.

The CHAIRMAN. State for the record whom you represent.

Mr. SILVER. Yes, sir; I am Washington representative of the American Farm Bureau Federation.

I will begin this testimony, gentlemen, by reading you the resolutions adopted by our organization.

First is a resolution of the American Farm Bureau Federation presented and adopted at its annual meeting held at the Hotel LaSalle, Chicago, on March 4, 1920:

"We support the measure pending in Congress looking toward the operation of the nitrate plant No. 2 at Muscle Shoals for the production of nitrogen fertilizer compounds."

Resolution passed by the American Farm Bureau Federation at the annual conference at Atlanta, Ga., in regard to Muscle Shoals. This was November, 1921:

"We recognize in the Muscle Shoals nitrate water-power project in Alabama such an essential measure to secure the preservation of our soil resources, as well as to develop the industrial and transportation facilities of our Nation, that we urge the Congress of the United States to authorize the Secretary of War to enter into such contract or contracts with Henry Ford for the completion and continuous operation of the project as will protect the public welfare. If such authority is not promptly given, we reserve the right to institute such action as will guarantee the completion and operation of this enterprise under Federal supervision."

Resolution adopted at the meeting of the Southern Group of the American Farm Bureau Federation, at Florence, Ala., January 20-21, 1922:

"Several hundred farmers representing the many thousands in organized agriculture, from 15 Southern States, as well as delegates from the West and Far West, after careful investigation of the dams and power plants at Muscle Shoals, Ala., believe it to be an economic crime to continue to allow this development to lie idle and uncompleted.

"As a means to proper development we unreservedly indorse Henry Ford's offer to lease and operate the power and nitrate plants.

"We reiterate the stand taken at the last meeting of the Farm Bureau Federation in indorsement of the Ford offer.

"We recommend that Congress authorize the issuance of bonds necessary to complete the dams at Muscle Shoals. This will avoid the necessity of taking funds direct from the Treasury. Henry Ford's offer would pay interest on such bonds, and the first earnings from the sale of electrical energy would amortize the bonds."

Resolution adopted in regard to Muscle Shoals at the agricultural conference called by Secretary of Agriculture Wallace at the request of President Harding, January 23-27, 1922:

"Resolved, To accomplish results without any further delay whatsoever, we urge the Secretary of War to recommend and Congress to accept Henry Ford's proposal to take over the hydroelectric power and air nitrate plants at Muscle Shoals under a guaranty to operate the same for 100 years, at its present capacity of approximately 100,000 tons of ammonium nitrate per annum, opening the Tennessee River to navigation, cheapening the production of fertilizer, metals, and other commodities, and assuring the United States nitrogen independence in peace or war."

This matter was not acted upon by the Farm Bureau Federation or its units in a guesswork way. Prior to the adoption of some of those resolutions, perhaps all of them, they appointed a committee which was sent to Muscle Shoals and did go on the ground, examine the property, and get such technical advice as they saw fit, and they made this report to our organization, and I would ask that that be inserted. I think I have enough copies here for each member of the committee.

The CHAIRMAN. Is that the same report that you furnished me a copy of some time ago?

Mr. SILVER. Possibly so.

The CHAIRMAN. When was that issued?

Mr. SILVER. I could get the date from the office. The report itself is dated May 31, 1921.

The CHAIRMAN. When was this committee appointed, Mr. Silver?

Mr. SILVER. At some previous time. I don't know how long previous.

The CHAIRMAN. How many members were on that committee?

Mr. SILVER. Three. Their signatures are in the report.

The CHAIRMAN. Yes; W. G. Jamison, president Colorado Farm Bureau Federation; John G. Brown, president Indiana Federation of Farmers Associations; and Chester H. Gray, president Missouri Farm Bureau Federation. This report is dated Washington, D. C., May 31, 1921.

Mr. SILVER. That is when the report was made, and those are the men who made it.

The CHAIRMAN. I suppose the report itself shows when they were appointed and where?

Mr. SILVER. I think so.

Mr. BOWER. I don't think it does, Mr. Silver. We could get that.

Mr. SILVER. If you care for that information I would be very glad to supply you with it.

Senator CAPPER. My recollection is that they were appointed shortly after the defeat of the Muscle Shoals legislation here in Congress.

Senator NORBECK. Would it not be more appropriate to put the conclusions of this report in your testimony and refer to it, than to incorporate all of this in our hearings?

Mr. SILVER. My reason for asking that that be included—not that I am going to urge it—was that you would have exactly before you the reaction in the minds of the committee that went on the ground and that visited and examined this place, and upon what they base their conclusions. I think that might be a feature that you would care for. You might take the same facts and arrive at that conclusion or some other one, but they give the facts upon which they base their conclusion and give their conclusion.

Senator HARRELD. Has that been published in the House hearings?

Mr. SILVER. Yes. They asked for it.

The CHAIRMAN. Just hand it to the reporter.

(The report referred to is as follows:)

REPORT OF THE MUSCLE SHOALS COMMITTEE OF THE AMERICAN FARM BUREAU FEDERATION.

To the executive committee, the American Farm Bureau Federation.

GENTLEMEN: Your committee which was appointed to investigate the Muscle Shoals project has performed that duty in the double capacity of personally inspecting plants and by collecting the available information from all sources for your consideration. We beg leave to report as follows:

I. INTRODUCTION.

Since the signing of the armistice on November 11, 1918, many of the operations in which the Federal Government found itself engaged prior to that date have been discontinued on account of a peace-time basis not requiring certain war expenditures and activities to be continued. It is with a great degree of gratification that all citizens see our Government gradually discarding all expenditures and all projects that were purely incidents of the great war. There are a few undertakings, however, the necessity for which had been seen before our entrance into the war, that deserve the fullest consideration both by urban and rural citizens to ascertain whether or not it is best to continue them indefinitely for the good of the general public.
